EXTRACT

*From an Act prescribing Rules for the Government of the State Library,
passed March 8th, 1861.*

SECTION 11. The Librarian shall cause to be kept a register of all books issued and returned; and all books taken by the members of the Legislature, or its officers, shall be returned at the close of the session. If any person injure or fail to return any book taken from the Library, he shall forfeit and pay to the Librarian, for the benefit of the Library, three times the value thereof; and before the Controller shall issue his warrant in favor of any member or officer of the Legislature, or of this State, for his per diem, allowance, or salary, he shall be satisfied that such member or officer has returned all books taken out of the Library by him, and has settled all accounts for injuring such books or otherwise.

SEC. 15. Books may be taken from the Library by the members of the Legislature and its officers during the session of the same, and at any time by the Governor and the officers of the Executive Department of this State who are required to keep their offices at the seat of government, the Justices of the Supreme Court, the Attorney-General and the Trustees of the Library.

SCIENTIFIC PRESS.

AN ILLUSTRATED JOURNAL OF SCIENTIFIC AND INDUSTRIAL PROGRESS,
Mining, Mechanic Arts and Inventions.

Patent Solicitors.

SAN FRANCISCO, SATURDAY, JAN. 7, 1871.

VOLUME XXII.
Number 1.

A Great Hydraulic Mining Enterprise.

The history of hydraulic mining in California has been one of bold engineering feats. We have to-day to speak of a new enterprise, the boldest of the kind yet attempted, which has lately been successfully brought to completion, and has opened a new field for the hydraulic miner. This is the introduction of water to the Cherokee gravel mines in Butte county.

This region has been worked to some extent for many years, but only during the winter months, with such water as could be obtained from reservoirs in the rainy season. From its elevation, however, there was but little opportunity for collecting water, and hence the locality, although known to be rich, has received but comparatively little attention. We propose to

find in many places that sheet iron pipes are employed, and work under pressures which startle engineers of acknowledged ability.

A case of the kind occurs in San Francisco. The Spring Valley Water Company convey their city supply of water from their reservoirs over a distance of 17 miles in two lines of sheet iron pipes, 30 inches in diameter. These pipes are made with the circular seams single riveted and the longitudinal seams double riveted, and with thicknesses and pressures as follows: No. 14 iron, 60 feet; No. 12, 100 feet; No. 11, 200 feet; and No. 9, 250 feet. This pipe was manufactured at the Risdon Iron and Locomotive Works of this city, under the care of Mr. Abby, Superintendent of the Water Company, of which company Mr. Schussler is Engineer. It was made in

$\frac{1}{4}$ for 600 feet, 5-16 for 850 feet, and $\frac{3}{8}$ for 900 feet. The water is admitted at the upper end from a cistern, with sand box, etc., for settling any sand or gravel brought in from the ditch. The pipe has here an elbow dipping into the water to prevent the entrance of any air. Fifty feet from the inlet there is a stand pipe to allow the escape of any air which may have got into the pipe, and to guard against an over-head of water. At different places, especially where depressions occur, are placed air-valves, made with floats to allow the escape of air, which shut on the approach of water. If the water is drawn off, these open on the inside, preventing the collapsing of the pipe from atmospheric pressure.

The pipe was laid in a trench (five feet deep), from one end to the other, and covered with earth to prevent any undue ex-

a cast iron pipe would render the enterprise impracticable.

Such is a brief outline of one of the greatest undertakings of the kind ever attempted, and one which opens a new and rich mineral region. That a work of such magnitude and boldness should be conceived and carried out, redounds greatly to the honor of our Pacific Coast. It speaks most highly for the talent of the engineers who conceived the plan, the enterprise of the men who undertook to put it in execution, and the ability of the mechanics who made it an accomplished fact.

To the Spring Valley Water Company and its officers is due principally this success; to Judson & Co. high praise should be given for their enterprise in undertaking such untried work; and to the Risdon Iron Works great credit for the able manner in

PROFILE OF HYDRAULIC PIPE LAID IN BUTTE COUNTY, CAL.

give a short description of the manner in which water has been carried into this place, and of the difficulties encountered and overcome.

Before speaking of this particular work, we may be allowed a few remarks upon that branch of engineering which treats of storing and conveying water, a subject which has engaged the attention of our most eminent engineers and called forth the utmost skill of the profession; and more especially the conveying of large quantities of water under great pressure—as in supplying cities where the houses and streets are at various elevations. For this purpose cast iron pipes have been almost invariably employed, the proper proportions of which have been so well ascertained that little or no risk is incurred in their use. Wrought iron pipes have been discarded, one of the most serious objections against this material being its tendency to rust.

But on our coast, where transportation and other items of expense are so costly, the use of cast iron renders many enterprises unprofitable, and other material must be employed, especially in gravel mining, where water has to be conveyed for temporary purposes over great inequalities of ground and in such quantities as to prohibit the use of cast iron. Hence we

lengths of 24 feet and dipped in boiling asphaltum, in which it was allowed to remain until a complete union had taken place. This done properly is a perfect protection against rust. This pipe has been in successful operation for many years. One line of 6,000 feet, after having been in use for 10 years, was lifted and relaid in another place, being found in as good condition as when first put down.

The success of this pipe led to the employment of one of greater magnitude—the one first spoken of—and induced Messrs. Judson, Abby, Davis and Doe to undertake to convey water to the Cherokee mines. Our engraving gives a profile of this pipe, showing the natural difficulties and the nature of the country. A ditch had been constructed from Concow Creek to Yankee Hill, and from this place the water had to be carried across the ravine of the West Branch to the opposite mountain, whence it was conducted in a canal to the mines of Cherokee Flat.

The inlet to the pipe is 150 feet above the outlet, with a vertical height from the lowest point to grade line of nine hundred feet. The pipe is 30 inches in diameter and is intended to carry 1,900 miners' inches of water. The thickness of iron used is No. 14 for 150 feet of pressure, No. 12 for 275 feet, No. 10 for 850 feet, No. 7 for 425 feet,

pansion and contraction in hot and in cold weather. It does not extend quite to the bottom of the ravine, but is carried over on a truss bridge at a height of about 70 feet. It was laid in lengths of 23 feet, which were riveted one to the other continuously, man-holes being placed every 1,000 feet to allow the entrance of the workmen. The rivets used were: for No. 14 iron, $\frac{1}{4}$ wire; No. 12, $\frac{1}{4}$; No. 11, 5-16; No. 9, $\frac{3}{8}$; and No. 7, $\frac{1}{2}$; driven cold. The first ($\frac{1}{4}$) was machine-riveted cold, hand-riveted hot; 5-16, $\frac{3}{8}$; $\frac{1}{2}$ driven hot. A steam riveting-machine was employed for nearly all of the pipe, giving better results than the hand labor.

The pipe was made at the rate of 1,100 feet per day, giving employment to a large number of men. The punching and shearing was done by machinery expressly designed for this pipe, and worked as high as 30 tons of iron daily, 87,000 feet of pipe being manufactured and laid in place, and the water run through, in four months from the commencement of the enterprise.

The thickness of iron required here gives us a datum for computing the comparative cost of cast iron and of wrought iron pipe; $\frac{3}{8}$ wrought iron sustains here a pressure of 385 pounds to the square inch, for which 3-inch cast iron (nearly) would be required to make it safe. The freight alone of such

which they performed their allotted task and carried the attempt to a successful end.

In the engraving the air-valves are denoted by A, and the 2-inch blow-offs by B. The circular seams are single-riveted; the longitudinal seams, double-riveted. I is the inlet and O the outlet. The letters, b, c, d, etc., denote the points of union of the different thicknesses of pipe. From I to b and s to O, No. 14 is used; from b to c and r to s, No. 12; from c to d and p to r, No. 11; from d to e, f to g, and o to p, No. 10; from e to f and n to o, and g to h, 3-16; from h to i and m to n, $\frac{1}{4}$; from i to k and l to m, 5-16; and from k to l, $\frac{3}{8}$. The capacity of the pipe is 1,900 miners' inches, or 50 cu. ft. per second.

PNEUMATIC GAS AT MARE ISLAND.—The Pacific Pneumatic Gas Company has been officially notified by Commodore Goldsborough, Commander at Mare Island, that the Company's gas works at the Navy Yard are accepted, and the contract completed to the satisfaction of the United States authorities.

A TERRIBLE INCIDENT of the war is reported by telegraph. Fifty wagons full of wounded were taken some distance. On arriving at the point of destination, nearly all the poor fellows were found dead—having been frozen.

MECHANICAL PROGRESS.

THE COTTERILL LOCKS.—*The Engineer* gives a description of these new patent locks, which we condense:—"The padlock, being without a rivet hinge, could only be forced with great difficulty. The hoop is in one piece with the bolt, and simply slides up and down to open and shut. The street door lock or latch has two keys; one only need be used during the day; by the aid of the other a cover is thrown over the first keyhole, preventing the insertion of the key, and backing up the tumbler with a strong stop plate to prevent the bolt being forced. This lock is applicable to small safes, office doors, etc. The keys are spindles with cams cut on them. The key being a number of eccentric circles, each differing, working in the centre of the tumblers, the lock is perfectly powder proof. Robberies are often committed by copies or impressions of the keys being taken; this is impossible with the Cotterill lock. The key working in the center of the levers gives a great advantage over all locks, the keys of which work on the edge of the levers, making it very much more difficult to pick or force. The keyhole being so small, any instrument inserted for picking fills it up, so that no second instrument can be inserted which will have the least effect. The safe or street door lock with two keyholes is doubly secure, as it forms two separate and distinct locks; the last or bottom key in locking throws a steel plate over the top keyhole, making it in every way safe from the burglar. Besides, in banks or large jewelry establishments two clerks may be present, each with his own key to open the safe, yet the lock can be made so that the principal may have a master key to open the two. The great advantage of the padlock is that the shackle is not fixed to the lock by a pin, but slides in and out of the lock, requiring a key to open it, yet it will lock itself. The keyhole is covered by a spring drop, which requires the point key to open it, so that no dirt can get into it, and wet is kept out of the body of the lock."

USES OF THE BESSEMER METAL.—"A correspondent of the *Maschinen Constructeur* says that he has seen Bessemer metal used with great advantage for making the piston-rods of steam hammers which were used for hammering steel. Wrought-iron pistons and piston-rods of the same dimensions were used up in a short time, by the change of the iron from a fibrous to a granular structure, in consequence of the repeated concessions to which they were subjected. Bessemer metal has also been used for locomotive axles with excellent results. Its use for this purpose, as well as for boiler plates, is continually increasing in Europe, though we have not heard of its application to either purpose in this country. The fact that it resists the oxidizing effects of a flame much better than wrought iron is a strong argument for its use in boilers. It is only about 13 years since the first introduction of Bessemer metal, and though its adoption for rail making has been contested, step by step, until it proved itself far superior to other iron, it is now almost universally commended for that purpose."—*Eng. and Min. Journal*.

WIRE ROPE BRIDGE.—At the Landore Siemens Steel Works, near Swansea, is an arrangement for carrying the matter from some excavations across a stream where vessels are frequently passing. Two steel wire ropes are stretched across, each bearing a "runner" with grooved wheels, from which is suspended a truck; and the runners are both attached to an endless wire cord which passes round a pulley on each bank, so that the loaded truck, descending by its own gravity to the opposite bank which is the lowest, draws back at the same time the empty one. To allow the passage of a vessel, the ropes are lowered to the bottom of the stream at its middle, by running forward the abutment over which they are strained; and this is afterwards drawn back by a hand winch worked by two men, the final tautening being accomplished by screw couplings to which the hauling chains are hooked.

CARBOLIZED VULCANITE.—*The Scientific American* has seen specimens of rubber goods, all made of the same materials and in the same manner, but a part of which were carbolized and a part not. All had been used in the same manner and for the same length of time. "The uncarbolized rubber and cloth were in a rotten and damaged condition, while the carbolized was apparently as strong and sound as when new."

PEAT FOR GAS.—T. H. Leavitt, of Boston, whose notes upon the use of peat fuel for locomotives and in iron works we have alluded to, writes the *Gas Light Journal* on peat for gas making. We give an extract or two from his letter:—"Prof. Johnson of Yale College says 'a retort of two feet width, one foot depth, and eight or nine feet length, must receive but 100 lbs. of peat at a charge. The quantity of gas yielded in a given time is much greater than from bituminous coal. From retorts of the size just named, 8,000 to 9,000 cubic feet of gas are delivered in 24 hours. The number of retorts requisite to furnish a given volume of gas, is much less than in the manufacture from coal. On the other hand the dimensions of the furnace are considerably greater, because the consumption of fuel must be more rapid, in order to supply the heat which is carried off by the copious formation of gas.' * * Dr. A. A. Hayes of Boston, reports an experiment with 16 lbs. of peat from Wisconsin. The quantity being so small the charge was made up with Picton coal. 134 lbs. Picton coal alone, yielded 536 cubic feet of gas; 5 feet being equal to 17 candles, or the whole to 1778 candles. The same quantity (134 lbs) of Picton coal with the 16 lbs. of peat added, yielded 620 cubic feet of gas; 5 feet of which were equal to 29 4-10th candles. In his report he says 'There are only two or three cannel coals known which afford so much illuminating material, placing this peat in the first class of gas materials. It exceeds all common cannel coals, and of course is far above any bituminous coal, and can be worked with poor coal to make good gas.'"

DISBURDENED SLIDE VALVE.—*The Artisan* has this notice of a device which is the subject of a recent English patent. "In order to relieve the slide-valve from the pressure of the steam or fluid upon its back, so as to lighten the friction against the valve face as far as is consistent with maintaining a sufficient contact, the inventors form the valve with a passage through it and a face at its back, which works steam-tight upon a plate carried by a cylinder passing through the bonnet or steam-chest cover by a suitably packed gland. This cylinder excludes the steam from the back of the valve more or less, according to its area. If the engine be non-condensing, the area of the cylinder will be somewhat less than that covered by the valve. For a condensing engine, the cylinder may be of larger area than the valve, and apparatus will then be provided to prevent the cylinder receding from the back of the valve when there is no proper vacuum in the condenser."

THE LAUNCH OF THE "THOROUGHFARE." the new steamer built for freight purposes by the C. P. R. R., which occurred on the 24th ult., was interesting as being that of the first of its class ever used on our coast. It is 165 feet long, 50 feet wide, has a double track, and can accommodate 14 to 20 freight cars. It was built under the superintendence of Mr. P. H. Tiernay. The engines, with 22-inch cylinders and 7-foot stroke, were built at the works of the railroad company at Sacramento. The steamer is very strongly constructed, and its launch was made the occasion of quite a little jubilee.

THE "PNEUMATIC DISPATCH." In the subterranean room adjacent to the entrance of the Broadway pneumatic tunnel, a small line of tubing has been arranged in connection with a blower to test some improvements recently suggested in the pneumatic system of transmitting mail matter. On a late visit of Secretary Robeson to the tunnel, the apparatus was put in operation, and a large mail of letters and newspapers sent through the tubes at a velocity of sixty-three miles an hour.—*Artisan*.

GRAINING WITH STENCIL PLATES.—We see this noted as the subject of a recent patent. A pattern of the grain of any wood is taken with tracing paper, and transferred to a plate, which is cut accordingly. This is placed upon the graining cloth, freshly laid on, and rubbed over with a cloth which removes the color at the openings. The plate is then removed, and the work finished with the ordinary graining tools.

AEROSTATION.—The Paris correspondent of the *London Engineer* writes that the French Academy of Sciences "has expressed its opinion in a very decided manner against aerostats heavier than the air moved by steam or other power; but it gave some countenance to a proposition by an engineer, M. Sorel, who uses a sail as a rudder, and a screw simply to produce a difference between the velocity of the machine and that of the wind. The balloon is, in fact, retarded by the screw, and thus resistance is obtained."

SCIENTIFIC PROGRESS.

THE "MUDLUMPS" OF THE MISSISSIPPI.—*The American Naturalist* for December has a notice of an abstract of a paper upon this subject, by Professor Hilgard, the State Geologist of Louisiana, read before the American Association. We quote:—"The Mudlumps are islands formed by upheavals of the bottom, off the mouths of the Passes, inside the bar. They often rise in mid-channel, obstructing navigation and diverting the current, and at times bringing up objects long ago lost from vessels. They form a number of pretty large islands, especially near the mouth of the Southwest Pass. On them we frequently find springs of liquid mud, accompanied by bubbles of combustible gas; these springs often exhibit all the phenomena of mud volcanoes—extensive cones of mud, with an active crater in the middle. Most of the material of the Mudlumps seen above water, bears evidence of having once belonged to active cones, now extinct. The conclusion reached is, that the mud is the same as that which is deposited on the 'blue clay bottom' of the Gulf, outside the bar, in a semi-fluid state. In its annual advance, the bar covers this mud stratum, which exists equally higher up the Passes; the increase in weight by vegetation, alluvion, etc., of the new formed land above, as well as that of the bar below the mouth, causes the bottom to bulge upwards at the points of least resistance, i. e., in the deepest channel. Attention was called to the fact, that of all rivers known, the Mississippi is the only one exhibiting either mud-lump action, or the peculiar narrow lands of bank, advancing rapidly toward deep water, which are known as 'necks,' and are obviously dependent on the mudlumps for their origin."

PROTOCHLORIDE OF COPPER.—We take the following from the *American Chemist* for December. It was communicated by Dr. Bettger:—"When protochloride of copper's placed in weak hydrochloric acid, and submitted to electrolysis, the electrodes being made of copper, the anode becomes covered with snow-white crystals of chloride of copper, while there is deposited on the cathode a thick layer of very loosely-adhering spongy metallic copper. When the latter is well washed, and next placed in a small flask along with a filtered solution of bleaching powder (hypochlorite of lime), that salt is partly decomposed, yielding, at first, very pure oxygen gas, but afterward a gas (not specified) which extinguishes the light of a burning taper."

INFINITE SLOWNESS OF FORM CHANGE.—"Suppose one foot of coal represents fifty generations of coal plants; and that each generation of coal plants took ten years to come to maturity—then each foot-thickness of coal represents 500 years. The beds of coal in one field may amount to a thickness of fifty or sixty feet, and therefore the coal alone, in that field, represents 25,000 years. But the actual coal is but an insignificant portion of the total deposit, which may amount to three miles of vertical thickness. Suppose it to be 12,000 feet—which is two hundred and forty times the thickness of the actual coal—is there any reason why we should believe it may not have taken two hundred and forty times as long to form? I know of none. But, in this case, the time which the coal field represents would be 6,000,000 years. * * The coal Flora, viewed in relation to the enormous period of time which it lasted, and to the still vaster period which has elapsed since it flourished, underwent little change while it endured, and, in its peculiar characters, differs strangely little from that which at present exists. The same species of plants are to be met with throughout the whole thickness of a coal field, and the youngest are not sensibly different from the oldest. But more than this. Notwithstanding that the carboniferous period is separated from us by more than the whole time represented by the Secondary and Tertiary formations, the great types of vegetation were as distinct then as now. The structure of the modern club-moss furnishes a complete explanation of the fossil remains of the *Lepidodendron*, and the fronds of some of the ancient ferns are hard to distinguish from existing ones. At the same time it must be remembered that there is nowhere in the world, at present, any forest which bears more than a rough analogy with a coal forest. The types may remain, but the details of their form, their relative proportions, their associates, are all altered. And the tree-fern forest of Tasmania or New Zealand gives one only a faint and remote im-

age of the vegetation of the ancient world. Once more an invariably-recurring lesson of geological history, at whatever point its study is taken up—the lesson of the almost infinite slowness of the modification of living forms—the lines of the pedigrees of living things break off almost before they begin to converge."—*Prof. Huxley*.

PHOSPHATE OF LIME—SOURCES AND DISTRIBUTION.—Dr. Lankester notices, in *Nature*, a paper by Professor Dyer on this subject. We quote a part of the notice:—"Mr. Dyer points out the abundance of phosphate of lime in igneous rocks, but hesitates about tracing its origin in such beds either to direct chemical combination, or to the inclusion of organically-formed phosphate in the rocks in question. He does not, in short, discuss the possibility of the combination of phosphoric acid and lime in the primeval state of the globe without the intervention of life, which one distinguished geologist at least denies. Mr. Dyer traces the occurrence of tricalcic phosphate in the various sedimentary deposits with great care. He considers the many structureless masses of phosphatic deposits which occur 'as residuary evidence of formerly existing life, of which they are to some extent the measure,' as graphite is in other cases. A greater influence in the production of these masses is attributed to animal than to vegetal life, though marine plants are stated to be especially rich in phosphate of lime, and have undoubtedly played their part in its introduction into sedimentary strata. Mr. Dyer mentions that the recent *Brachiopod Lingula* has 86 per cent. of phosphate of lime in the mineral ingredients of its shell; and the occurrence of large quantities of phosphate of lime in the great Laurentian and Silurian formations is noticed by him in detail, as well as its occurrence in Devonian and Carboniferous limestones. In emerging to the group of mesozoic strata, we leave behind almost entirely those veins and beds of 'phosphate' which occur in the older and more changed rocks, where the segregation of the phosphate of lime has been more completely effected, owing to the greater age of the beds. In mesozoic and tertiary strata we find those nodules which have so erroneously been confused with 'coprolites.' Mr. Dyer accepts the history of the origin of these nodules which I have advocated in describing those which occur below the Suffolk Crags. Clay has a remarkable power of detaching phosphate of lime from its solution in carbonated water; and the phosphatic nodules are bits of clay which have become imbedded with great quantities of bones, and in some cases, probably, with sea-weed too; whence, by the intervention of gas-charged water, they have extracted the phosphate; hence all beds of phosphatic nodules occur near to argillaceous strata of special character."

PHOSPHORESCENCE IN RAREFIED GASES.—M. Sarasin details experiments undertaken to show the cause of phosphorescence in rarefied gases after the passage through them of an electrical discharge. One of his conclusions is that this phenomenon is due to chemical action. The gas is decomposed by the current, the oxygen contained in it is partially converted into nascent oxygen, or ozone, throughout the entire mass of the gas. In this condition it has a very strong tendency to unite with the other elements present; and, indeed, as soon as the current ceases it unites with them. This re-combination of the nascent oxygen or ozone takes place with energy, and may rationally be supposed to be accompanied by a generation of heat, which in its turn brings about the phenomenon of light which we call phosphorescence.

NEVADA FOSSILS.—Mr. Meek, in sending to Professor Leidy, for publication, descriptions of some fossils collected by the U. S. Geological Survey, under the direction of Clarence King, Esq., says:—"You will please state, in presenting the paper, that the trilobites described in it from Eastern Nevada are decidedly primordial types, and, so far as I know, the first fossils of that age yet brought in from any locality west of the Black Hills. Mr. King's collections also establish the fact that the rich silver mines of the White Pine district occur in Devonian rocks, though the carboniferous is also well developed there. The Devonian beds of that district yet known by their fossils, seem mainly to belong to the upper part of the system. Mr. King, however, has a few fossils from Pinon Station, Central Nevada, that appear to belong to the horizon of the Upper Helderberg limestone of the New York series."

CORRESPONDENCE.

Notes of Travel in Colusa and Yolo Counties.

[WRITTEN FOR THE PRESS.]

To persons resident in, and familiar with Yolo and Colusa counties, no explanation of the accompanying map of Grand Island is necessary. But as the work of reclaiming this section is one of the most extensive in the State, and therefore of more or less interest to all, I submit a few explanations.

Bridgeport, shown in the upper end of the map, is situated near the north end of Grand Island, six miles south of Colusa, and about eight miles north of the line of Yolo county. It consists of a store, blacksmith shop and a few dwellings. Eddy's Landing, six miles south of Bridgeport, is similarly situated. There is a ferry for crossing the Sacramento River at this point. Grand Island is a village of about 100 inhabitants, situated one mile south of Eddy's Landing, and is a very promising little place. John Bader is the village blacksmith, and C. J. & G. E. Diefendorf are the principal merchants. Knight's Landing, the principal shipping port in Yolo county, is situated at the lower end of Grand Island, on the west bank of the Sacramento River, and about 10 miles north of Woodland, the county seat of the county. It contains about 500 inhabitants and just now is quite a lively place, on account of the extensive levee (now being built by Reclamation Company No. 108), which gives employment to some 400 or 500 men.

Reclamation and Irrigation Plans.

A. H. Rhodes, Lewis A. Garnett and Chas. F. Reed are the Trustees of this company, and Capt. William Blanchard is managing counsel. These parties own 42,000 acres of swamp and overflowed lands. The district contains 72,000 acres, commencing at Knight's Landing on the south and running to Upper Sycamore Slough (near Bridgeport), 40 miles distant by the river. The imaginary line (see engraving) on the west bank of the Sacramento River, is to represent the course of the levee now constructing, which will be some five miles shorter than the course of the river. J. M. Lemon, Esq., of Suisun, is the contractor of this immense undertaking, and it is estimated that it will cost \$140,000, or about \$2 per acre, to reclaim.

The levee is built four feet high, 20 feet wide on the bottom by four feet wide on top. About 15 miles are now completed, and weather permitting, the entire work will be completed by the last of this month (January). A small portion of this island, just above the Yolo county line, and known as the "Mormon Basin," has been previously reclaimed, and produced 40 bushels of wheat to the acre last year. At the upper end of the island, some seven miles south of Colusa, this same company are putting three large dams in the Upper Sycamore Slough, and erecting flumes, for the purpose of irrigating this entire tract during the driest season. The imaginary line on the extreme west of the engraving represents the high land, to which point this company's claims extend. The supposition is, that if this company are successful and thoroughly reclaim this section (which is now not worth one dollar per acre), in one season it will be worth \$15 per acre—a splendid fortune for its projectors, and perfectly feasible of success. Chas. F. Reed conceived the original plan, and sought capitalists in San Francisco, who joined him in this enterprise.

Mr. Reed's Ranch.

He proposes personally to seed 1,000 acres in wheat and 500 acres in barley. He has on his ranch stock of various kinds, including the best breeds extant. He purchased of Col. Younger, of San Jose, his thoroughbred hull, "Jeff Davis," paying therefor \$1,000. This bull received the first premium at our last State Fair. He

also purchased of J. Guill, of Chico, his thoroughbred cow, "Nellie," for \$500. In addition, he has numerous breeds of thoroughbred horned cattle. Of horses, he has colts of the Black Hawk breed, sired by Black Eagle, a horse which Mr. Reed purchased of Jones & Rochnell, of Vermont, for \$5,000. On Mr. Reed's place he has a steam engine, which is used for supplying his house with water; also for the stock in his fields. The water from the tanks supplies a fountain in front of his residence, and then passes by pipes to his fields for the young stock. He is also the owner of a large warehouse in the town, the capacity of which is over 5,000 tons. The specimen of wheat I send you, is called *Tow-selle*; and from seven pounds sowed by C. Barney (3¼ miles southwest of Knight's Landing), 240 pounds were reaped. The specimen of seven pounds was from the

5-inch face and 2¼-inch pitch, in which works a 10-inch pinion, which is connected with the engine by a combination of gearing so arranged that by the working of four clutches the machine can be propelled either forward or back from one to 10 miles in 10 hours, without any increase or decrease of the speed of the engine. The hind wheels are six feet in diameter and one foot face, work loose on a crooked axle similar to the hind axle of our large city trucks. The hind part of the machine rests on a rocker placed on this axle, to which are attached tiller-chains, which pass around the forward end of the machine and are worked by a worm gear with a crank, which guides or steers the whole machine.

A few feet forward of the middle of the machine is an iron wheel, seven feet in diameter, to which are attached four knives, angular-shaped, and which extends 12 inches

Department of Agriculture at Washington, to Chas. F. Reed, Esq., and \$5 per ounce was refused for the same at the last Chico Fair. This wheat will average 65 pounds per bushel.

At Knight's Landing, Messrs. Rhodes, Eves & Co. own a very fine flouring mill, run by a 40-horse power engine, and turn out about 20,000 barrels of flour annually, besides ground feed, barley, corn meal, etc. Messrs. Langenour & Brownell, of this place, are the principal shippers of wheat, barley and wool. For the 12 months just past, 10,000 tons of wheat and barley, and 25 tons of wool were shipped. The capacity of their warehouses is 9,000 tons.

Fletcher's Steam Ditcher.

A. Fletcher's steam ditcher, now successfully at work ditching on the farm of Chas. F. Reed, is 41 feet long, 12 feet wide and 12 feet high, has an upright boiler (8 feet long, 44 inches in diameter, and with 109 2-inch tubes), attached to which are two engines of 7-inch bore and 12-inch stroke, which with 100 pounds of steam and 150 revolutions, give 24½ horse-power. The machine stands on four wheels. The forward or propelling wheels are eight feet in diameter, with 2-foot face, and are attached to the forward shaft like the driving wheels of a locomotive. To one of these wheels is attached an internal gear, 6-feet diameter,

each way laterally. This wheel revolves about 30 times a minute, cutting a ditch two feet wide and 4½ feet deep. Upon each side of this cutting wheel are knives extending from the bottom of the wheel upward and outward, like the sword cutter of a plow, which trim the outer edge or side of the ditch, and give the slope, or flare, as desired. Following this wheel is a scraper, the point of which comes under the wheel, and extending backwards and upwards is an apron or belt of india rubber, two feet wide, upon which the wheel drops the dirt, cut and pulverized fine. This is carried back and up to the rear of the machine, where it drops on to a top or side apron, which carries it to either side of the ditch. This side apron is arranged so that it will carry the dirt either to the right or left, by moving a clutch. As the cutting apparatus is working, the whole machine is moving forward, and the quantity of work it does is regulated by giving it a fast or a slow motion forward, without changing the speed of the engines. It costs about \$5,000, weighs seven or eight tons, and was constructed by I. H. Small, corner of Beale and Market streets, San Francisco.

Woodland.

Woodland, the county seat of this (Yolo) county, is one of the finest looking towns, for its size, in the State. It probably contains 1,000 inhabitants. Over two-thirds

of its buildings are fire-proof brick. They have as fine county buildings here as anywhere in the interior; a splendid college building, ranking among the first in the State, not only as to size, beauty and material, but also in the aggregate attendance of its pupils; also a fine bank, known as the Bank of Woodland, with a capital stock of \$200,000; and several manufactories. The Yolo Brewery building and its surrounding shrubbery is a noticeable feature near the suburbs. Jas. Sibley manufactures all kinds of doors, sash, scroll work, sawing and planing; and C. Elliott, Esq., manufactures all kinds of carriages, huggies, sulkeys, express and lumber wagons, also Miller & Elliott's patent improved carriage construction, of which an illustration with full comments were published in your issue of September 24th. Mr. E. employs regularly 10 men, and has on hand specimens of nearly every vehicle known in his splendid two-story fire-proof brick building, 60 feet deep by 84 feet front, situated in the upper end of the village, on its principal street. Gray & Wood are the principal dealers in hardware and agricultural implements, and Dr. D. D. Hunter presides over its best hotel.

L. P. MO.

San Francisco Notion versus Boston Notion.

EDS. PRESS:—In your last issue, you notice a Boston device by which runaway horses can be instantly detached from their carriage. But is not the San Francisco invention of Dr. Le Plongeon (recently patented through your office), by which runaway horses can be instantly checked and controlled and kept by the carriage, infinitely preferable? Detached runaway horses may do much harm to others, but Le Plongeon's contrivance prevents all this. His halter is cheap, can be fitted to any bridle, and is well worthy of a trial. It can be found at Main & Winchester's, Battery street.

[Personally, we should greatly prefer Dr. Le Plongeon's method to the other, and coincide fully in the opinion of our correspondent in believing that it is at least "well worthy of a trial."—EDS. PRESS.]

Cool Impudence.

A couple of New York lawyers send us a request to insert an advertisement in our paper, to the effect that they will obtain divorces anywhere, anyhow and for anybody, and without any publicity. We suppose the last means that they propose to obtain divorces without the knowledge of more than one of the parties interested.

This matter of obtaining divorces seems to be quite a flourishing business in the States beyond the mountains. Almost every day we see accounts of most disgraceful events of the kind. To such a shameful extent are these things carried on, that people are becoming aroused to the necessity of taking strong measures in the matter; and one New York judge has declared from the bench that he will mete out heavy punishment to legal parties who carry through the improper divorce cases by unrighteous means.

However our Pacific Coast population may compare in other respects with those of the Atlantic Coast, we have not yet reached the point attained there in this respect. We consider it exceedingly cool, not to say impudent, on the part of the lawyers referred to, to send us such a proposition; and as we do not propose to play the part of pimps, we decline inserting their advertisement.

INTERESTING TIDE FIGURES.—The height of the tide is from 5 to 12 feet on our Atlantic coast, and from 2 to 4 feet in the central Pacific ocean. In the Bay of Fundy it is from 50 to 70 feet. At this locality the waters of the in-coming tide are raised so high that, as they advance, they seem to be pouring down a slope in a turbid waterfall of great extent. In the Tsien-tung River, in China, the advancing water rushes on like an advancing cataract, 4 or 5 miles broad and 30 feet high, and speeds up the stream for 80 miles at a rate of 25 miles an hour! The change from ebb to flood tide is almost instantaneous. In the Amazon river, the incoming tide passes up the stream in five or six waves, each 12 to 15 feet high, which follow one another in rapid succession.

MINING SUMMARY.

The following information is gleaned mostly from journals published in the interior, in close proximity to the mines mentioned.

California.

ALPINE COUNTY.

EXCHEQUER.—*Miner*, Dec. 17th:—The mill is progressing. The mine, since the air shaft struck through, is worked for ore, and turning out some of fine quality.

GLOBE.—Work on the mill is going ahead, and the balance of the machinery is expected soon. In the south drift ruby silver continues to be met with.

SCHENECTADY.—The winze to connect the lower and upper works was cut through last week. Good air is now plentiful, and work is going on in several places. We hear that a mill will go up as early in the Spring as possible.

RICH.—A body of ore, the richest and best which has been opened in Alpine since the big strike in the Tarbush four years ago, was entered by the drift of Monitor tunnel No. 3 this week.

SILVER GLANCE.—Same of 24th:—Some fine indications in this tunnel this week: true silver glance ore and the diamond shaped crystals of gypsum, which are said to indicate native silver, are found.

M. & N. W.—In this mine the ore continues and a vast body is being exposed ready for Spring operations.

RUSHING IT.—In the south drift of the Globe mine splendid work is being done. Twenty-seven feet was added to the length last week and 144 during the past six weeks.

LEVATHAN.—The men working in the up shaft from the lower tunnel complain of the same noxious gas which four years ago drove everybody from the face of the upper tunnel.

MINES SOLD.—We are permitted to state that negotiations are complete and two well known claims adjoining the Globe property, the Marion and the Chicago & Detroit, have been added thereto.

NEARING THE LEDGE.—*Chronicle*, 24th:—The Mount Bullion tunnel is progressing finely, and is rapidly approaching the main ledge—the Wellington—of the company.

AMADOR COUNTY.

LITTLE AMADOR.—*Ledger*, Dec. 24th:—This mine, at Amador City, is steadily improving as they go down, and last week they struck the richest rock ever found in it. We hear that the vein is five feet wide, and the rock completely studded with gold.

CONEX.—*Dispatch*, 24th:—We understand some very rich rock is being taken out of one of the shafts of this mine.

LANCHA PLANA.—Same of 31st:—We learn that the mines in the vicinity of Lancha Plana are paying better this winter than for several years.

BUTTE COUNTY.

THE WATER IN CHEROKEE.—*Oroville Record*, Dec. 24th:—The great iron pipe had its first trial two weeks ago and gave way. This looked gloomy; but repairs were made, and on Monday last the water was again turned in. The excitement in town was intense. Everybody in town turned out to see the result. In three hours and forty minutes the stream poured forth at the mouth. Men shouted with gladness. Anvils were fired. Rejoicings were kept up all night. The "richest mining section in the State," dependent for 20 years upon the winter rains for water, has now a living stream.

CALAVERAS COUNTY.

RICH SULPHURETS.—*Chronicle*, Dec. 24th: Half an ounce of sulphurets, taken from the Palomo mine at a depth of 400 feet, assayed four and a half cents. This is at the rate of \$2,160 per ton.

NO WATER.—All the mills and mines have been compelled to cease operations for the lack of water. The ditch is frozen up at its head. The weather is moderating, however.

WHAT CHEER CLAIM.—A company has been formed to re-open the old claim in Chili Gulch. The machinery at Gleason's Incline Tunnel, near the Junction, is being removed to the What Cheer. Work will be commenced as soon as the hoisting works are erected. An incline 450 feet in length will be run to reach the channel.

ITEMS.—Same of 31st:—At the Palomo the batteries have been in operation since Monday. The main shaft of 400 feet is being heavily retimbered. The lead is wide in the bottom of the shaft and the rock prospects largely. At the Junction Paul & Co. are getting out good gravel. Their tunnel is over half a mile in length, nearly perforating Stockton ridge. Having "struck the channel," they are "breasting out" and getting fair pay. In Chili Gulch Brackett & Co. and Shaw have been compelled to suspend operations, tempora-

rily, for the want of water. The Union Shaft Co. and Megaw & Co. are steadily employed. The former are making considerably more than wages. Work is being vigorously pushed forward upon the What Cheer. The machinery is all on the ground and the incline will be commenced in a few days. On Tunnel Ridge Mosher & Co., Johnson & Co. and Blake & Co. are actively employed with fair returns.

INYO COUNTY.

FISH SPRINGS.—*Cor. of Independent*, Dec. 19th: The mines are two miles northeast of town, and are owned by Messrs. Westerville & McMurry. They are working from 15 to 20 men most of the time. The rock pays from \$30 to \$60 per ton, in arastras.

NEW DISTRICT.—A mining district has been formed nearly opposite Bishop Creek, in the Inyo Mountains. We have a specimen of ore from the "Peerless," a ledge located on the 15th, which indicates considerable richness in "flour" gold, assaying \$300 per ton. The ledge is five feet in width, and traceable 1,200 feet.

The same of Dec. 26th gives the results of four assays of the rich ore struck recently in the Eclipse mine. They range from \$772 to \$4,231 per ton; average, \$1,898.

LASSEN COUNTY.

BIG VALLEY.—The Susanville *Sage Brush* of Dec. 10th says the miners were about to hold a meeting to make laws for the district, which would compel all owners of claims to stay on the ground to hold them.

NEVADA COUNTY.

CEMENT HILL.—*Gazette*, Dec. 28th: Messrs. Rolfe, Stranahan & Co. have one of the most substantially built flumes in the county. It is 750 feet in length, four feet wide and two deep, with a grade of eight inches in 12 feet. In the flume they have three undercurrents, each with a drop of from 15 to 25 feet. Rolfe & Co. have all their pipe upon the ground, and will be in readiness for work by the end of this week. They have 15-inch pipe connecting with their bulkhead, and extending down 500 feet, where it will connect with 11-inch pipe. They will have 175 feet perpendicular pressure, and will use 500 inches of water.

MEADOW LAKE.—*Transcript*, Dec. 23d: Capt. Hanly came through on Wednesday, part of the way on snow shoes. The prospects are encouraging. The Grant mine is yielding handsomely. The 8-stamp mill erected by Squire & Pattison has been running until the late cold weather, when everything froze up. The mine has been opened to the depth of 100 feet, and the rock pays \$12 to the ton in free gold, and yields a large amount of rich sulphurets. The ledge is three feet thick. The Mohawk and Montreal mill has been working rock from the Greenhorn mine. About 120 tons paid \$23 per ton. The Samary ledge, at 14 feet below the surface, yields well; and on the surface the croppings, 10 feet wide, can be traced 1,000 feet. Rock will be crushed in the spring. The Scoddiac, owned by Hanly & Co., is three feet wide on top and prospects well. At Ossaville, near Meadow Lake, Bull & Culbertson have fitted up a mill and are working three or four ledges, which give promise of great richness.

THE SEASON.—Same of 29th says: The extremely cold weather has frozen the ditches, and the small amount of water, which has fallen has been of little benefit to the miners in the upper part of the county.

BLOOMFIELD.—Same of 30th: The Gravel Co. are still prospecting in the basin at Malikoff. The gravel deposit is 208 feet from surface to bed rock, and 50 feet of this prospects big. They have run 60 feet in the main drift, and are running two other drifts. The claims are paying well, 11 hands are employed, and the gravel is washed as it is taken out, yielding an average of \$350 every 24 hours.

ERIE MINE.—Veatch & McCullough have commenced running their 5-stamp mill, and are succeeding beyond their expectations. Forty men are employed. The ledge is 16 feet wide and pays from \$20 to \$30 per ton, including the casings.

NORTH STAR.—*Grass Valley Union*, Dec. 23d: On Tuesday Mr. Hoyt shipped below a bar of gold, valued at between \$6,000 and \$7,000.

ALTA No. 3.—Same of 28th: Work on this gravel claim is pushed. The Co. have erected hoisting works, and are sinking their shaft as fast as possible. They are down 50 feet, and will soon reach the gravel bed.

EUREKA.—This mine had its regular clean up and melting yesterday. The result for the past 12 days, exclusive of sulphurets, was three bricks containing \$27,000. The Co. have been running on low grade rock which has been above

ground for some time. The preceding run of 12 days yielded \$33,000.

ITEMS.—The *Union* of January 1st gives an extended review of the mining situation. We select items in brief: The new mill of the Empire is almost ready for crushing. There are 20 stamps of 810 pounds each. A heavy Blake's rock-breaker and 10 Hendy's concentrators will be used. The mine is already pumped out, and there is wood enough on hand to last until July. The North Star is opened to the 10th level, 1,200 feet down on the incline. Much new work has been done, all of which has been paid for from the proceeds, besides the regular dividends. South Star Co.'s hoisting works will be running in two weeks. Sazerac gravel claims have been leased to four miners. Eureka yield for December was \$69,410. Greenhorn mine is stopped for want of water to run the mill. The last crushing of the O'Connor mine (Grass Valley Consolidated), with specimens sold, paid \$60.75 per ton. Allison ranch mill is running most of the time. Grant mine got \$600 from 35 loads rock at Perrin's mill.

PLACER COUNTY.

RICH STRIKE.—*Stars and Stripes*, Dec. 29th: Another rich pocket was struck last week by McClure & Tharpe, in the new shaft on their claim, on Duncan Hill. One day they obtained by hand crushing \$250, the next day \$200, and within the week near \$1,000. They have also taken out, from the neighborhood of this, a considerable quantity of milling rock that will yield \$50 per ton.

BLUE CEMENT.—The Indiana Hill Mill and Mining Co., below Gold Run, last week finished crushing 300 car loads, which yielded an average of \$3.

SURVEYING QUARTZ CLAIMS.—*Herald*, Dec. 24th: United States Deputy Surveyor has been surveying the mines of the Ophir Co., the Green mine and others in the vicinity of Ophir, preliminary to purchase under the Act of Congress of 1866.

NO WATER.—Mr. Reamer has the Bear River & Auburn ditch cleaned out and ready for water, but there is no water to fill it. The cold weather holding the snow on the mountains has almost exhausted the supply in Bear river.

PLUMAS COUNTY.

EUREKA MILLS.—*Quincy National*, Dec. 24th: The Co. have closed their mills for the winter, but will continue to work a light force in the mine, developing for next season's run. They have taken out more money during the past season than for any other since inauguration of work upon the mine in 1851.

NEW DIORINOS.—Wm. Roach, in Jamieson District, has been striking a good range of gravel, on Bear Creek, two miles west of the town.

SNAKE LAKE.—*Cor. of same*: Metcalf & Haycock have finished another large reservoir. Metcalf is working five men, cutting bed rock and tunneling. Haycock has two men, tunneling. Challans, Smith & Co. have done well in the old Jacks' claims. Esq. Jacks keeps pogg'ing away and occasionally gets a "knock." The Golden Enterprise are moving in their undertaking below Spanish Ranch. The Co. tunneling through the Devil's Elbow have succeeded well, and will, by July, tap the creek; they will then drain half a mile, which will pay big, in places. McCarger & Pearley are prepared to hydraulic on Pine Leaf, when water is plenty. The Silver Creek miners are waiting for a rise in the creek, as well as the Meadow Valley boys. Tom Ivey and Taylor, on Emigrant Hill, have struck good pay dirt; and Radley & Coleman have made a new discovery near Butterfly Valley, the gravel on the rim rock prospecting 40 cents to the pan.

SAN BERNARDINO COUNTY.

CLARKE DISTRICT.—*Guardian*, Dec. 24: Capt. Moss and Dr. Cochran inform us that the mines continue to be worked with satisfactory results.

SIERRA COUNTY.

WATER SHORT.—*Democrat*, Dec. 22d: The water in the lakes from which the Reis and Independent mills get their supply is so low, owing to the cold weather, that it is impossible to work more than half the stamps. Ore has accumulated in consequence, and some of the workmen have been discharged.

KEYSTONE.—*Messenger*, 31st: The lower tunnel is nearly completed. The workmen have commenced to drill a "long hole" to tap the shaft and let off the water. The new tunnel is fourteen hundred feet in length. It is expected that the mill will be started before long.

SISKIYOU COUNTY.

LITTLE HUMBUG.—*Yreka Union*, Dec. 28:—A. Best and W. G. Rider have purchased a half interest in Commodore Jones'

claim. Should there come a good head of water this winter, there will be twenty men at work on the creek.

SCOTT VALLEY.—*Cor. of Yreka Journal*, Dec. 28th:—Jenner & Co., at the "Etna Claim," have succeeded in striking upon apparently the main channel, of richly paying dirt, which is thought to run through the foothills, from South Fork, the extreme length of Scott Valley. It appears to be of equal richness for a depth of five feet. A set of night and day lands, are placed on, to secure the utmost advantage of the water as it comes.

TUOLUMNE COUNTY.

QUARTZ.—The *Sonora Democrat* of Dec. 31st says: The quartz mining interests in this county seem to be looking up again. The Grizzly Mine yielded largely from the surface down a short distance. It changed hands several times. An English Co. spent large sums without success. Last fall work was again commenced by the same company, under intelligent management, and has resulted in the development of rich ore, and the mine now has every prospect of being successful. The Knox & Boyle mine, from had management was run into debt and sold at forced sale. The purchasers have worked only for the purpose of ascertaining the value. Tunnels and shafts have been run until it has developed a mine of great richness. The App mine was sold two years ago to parties in the East. For some months sinking of shafts and driving of drifts has been going on which result in showing large bodies of fine ores. Ore from the Heslep mine has been continuously worked at a small profit for years. Within a few weeks a body of extreme rich ore has been reached, which, when opened, will produce large. A few days ago some parties discovered a rich vein near Yankee Hill. The Confidence mine has been worked a year, and has made satisfactory returns, much of the time yielding largely. In this mine, there is paying ore enough in sight, and some of it very rich, to require machinery for crushing several years to come. Never until the present management could it be made to pay.

TRINITY COUNTY.

NEW RIVER.—*Journal*, Dec. 24th:—A correspondent from Pony creek, says that the miners have gone into Winter-quarters. Eleven men will winter there.

CANYON CITY.—*Cor. of same*:—L. G. Fisher and W. W. Allen are opening a claim on the head of Tyson's Bar. Chinamen are constructing a hydraulic 400 feet in length across Red Flat. C. J. Foran—known as "Happy Jack"—has taken charge of David Evans' East Fork ditch.

YUBA COUNTY.

STUCKER FLAT.—*Marysville Appeal*, Dec. 22d: The Blue Point Mining Co. for the past four years have done little except in tunneling. During this time a tunnel 2,100 feet in length has been made, and the powder drifts at the interior end are now just completed. The flume connecting with the tunnel is a mile in length. The powder drifts are 17 feet from the surface, and into them will be placed 2,500 kegs of black powder. The blast will be the largest ever made in the world, and, if successful, upwards of 33,000 tons of earth will be loosened. The work thus far on these claims has cost the company over \$150,000.

Same of 31st, says the blast was let off on the 29th, and was a complete success.

SMARTSVILLE.—*Appeal*, Dec. 22d: The Pittsburg and Yuba River Co. have sunk two shafts, one to the depth of 35 feet, but could not sink to the bed rock, on account of the water. They found blue gravel the entire distance, most of it very rich. This company proposes, should the cement prove rich enough, to erect a mill, and crush it, if so they will not run a tunnel. At the Blue Gravel Co.'s claims they are running a tunnel which will require a year to complete. Meanwhile they are washing top dirt. Upon the Smartsville Consolidated Co.'s claims they have been washing continually since July, and have now just finished cleaning up. They make another blast to-day or to-morrow.

Same of 31st says: During last week two blasts were made, one of which was not entirely successful. In this, 700 kegs of powder was used, and but 100 exploded. This was sufficient to cover up the rest of the powder, so that they were obliged to wash away the earth to get at it. In doing this it was wet, so that out of the remaining 600 kegs but about 30 were recovered in good condition, putting them to a loss of about \$3,500. It was expected that they would make another blast yesterday of 700 kegs.

TRIBUTOO.—*Appeal*, Dec. 22d: But little has been done during the winter, ex-

cepting upon the Babb claims. Here they have been crushing cement at the mill all the time. The cause of delay in the work on these claims, is the moving of the pipes that supply the water, and replacing with new ones.

Nevada.

COPE DISTRICT.

U. S. GRANT.—Elko *Independent*, Dec. 24: This mine is near the Argenta. The width of the lode is 16 inches. Specimens sent us were completely filled with sulphurets, and assay well.

REESE RIVER.

FROM CORTEZ.—*Reveille*, 22d: Mr. Fitzgerald has just arrived. Several claims are being worked, but owing to the want of mill facilities the miners confine themselves to the extraction of ores rich enough to stand the cost of transportation. Their nearest point is Mineral Hill, twenty-five miles.

BULLION.—Same of 26th: On Friday and Saturday, the Manhattan Co. shipped 22 bars of bullion weighing 2,062 pounds, and valued at \$29,650, to New York.

Same of 30th: The Manhattan Co. shipped last evening ten bars weighing 917 pounds, and valued at \$13,103.

BELMONT.—White Pine *News*, Dec. 16th: Thos. Cahill, just returned, gives us: Canfield, of the Transylvania, is building a 10-stamp mill, and a better furnace, of the Stetefeldt pattern, than has yet been erected. He expects to have the establishment in operation in four weeks. Four hundred tons of first-class ore on the mine dump, every pound of which is fit for cabinet specimen. Beside, three to four hundred tons of second-class ore are on the dump—working \$150 to \$175 a ton. The 'Combination' mine has changed owners; and in two months active operations on a large scale will be commenced. Silver Champion, lately purchased by Judd Bates, has out 6 tons of ore of an average assay value of \$1,500.

WASHOE.

OPHIR.—*Enterprise*, Jan. 1st: Work is prosecuted in the up-rise toward the old ore ground at the central line. As good ore was struck in the ninth level about this point, it is expected that the up-rise will tap the same 150 or 200 feet below. The past year has been barren of results, so far as finding pay ore is concerned. Five assessments have been levied, amounting to \$255,000.

IMPERIAL-EMPIRE.—The drift east from the 1,300-foot level has penetrated to the east wall of the ledge without finding ore. The annual report of the Empire gives the following: No bullion has been produced during the year. The shaft has been sunk from 1,179 feet to 1,300 feet, and retimbered between the 600 and 800-foot levels. The amount expended is \$23,782. The shaft has been sunk in connection with the Imperial, at a total cost to the Empire to date of \$129,591. The Imperial are now drifting in the 1,300-foot level, and the Empire are awaiting the result.

YELLOW JACKET.—After a stoppage of a month to put in new hoisting machinery, this Co. have resumed operations. From the winze 300 feet north of the shaft below the 900-foot level, some extra good ore is being extracted. Day before yesterday they resumed shipping ore to the mills on the river.

SIERRA NEVADA.—The mine is yielding the usual ore. The mill shut down December 24th for repairs, at which time they made a shipment of bullion amounting to \$10,752 18. The mill will resume work the present week. The Evans mill is in constant operation upon ore from the mine.

CHOLLAR-POTOSI.—This mine continues to yield well with some improvement in the quality of the ore. A drift is being run from the main west drift to cut the vein under the Belvidere section.

VIRGINIA CONSOLIDATED.—The drift to the west is in 1,040 feet. The rock in the face is favorable, though somewhat harder. The north-west drift is now in 70 feet.

HALE AND NORCROSS.—The daily yield is 175 tons from all parts of the mine, but principally between the sixth and seventh levels. The ore body on the lowest level has improved.

CROWN POINT.—There has been no change in the deposit found in the south drift upon the 1,100-foot level.

DANEY.—The station for the 300-foot level has been opened and timbered. From this a drift has been opened toward the vein, which is in nine feet.

SEGREGATED BELCHER.—This Co. are working one shaft on a drift east between the 400 and 500-foot levels, for the purpose of tapping the east ore body. The drift is in 70 feet.

GOULD AND CURRY.—A good deal of prospecting is being done in the old

upper works, but no new bodies of ore of any extent have been found.

WHITE.—This new lead, still looks well. The owners have drifted south upon it for 25 feet, and find that it holds its width for that distance. It is supposed to be a continuation of the Comstock.

HOPE.—This is yielding as usual. Owing to the freezing weather two weeks ago there has been little water since.

BELCHER.—The drift west upon the 420-foot level has as yet developed nothing valuable. Some low grade ore is found at the bottom of the incline on the 334-foot level.

SAVAGE.—Some good ore has been found in the upper works, considerably increasing the total yield. The ore breasts on the ninth level are looking better. The assays have improved.

OVERMAN.—The company are extracting 90 tons of ore per day from their 400-foot level, north of that portion of the vein which is in litigation. Mine looking as usual.

WHITE PINE.

REVIEW.—*News*, Dec. 31st: Mining matters have, during the year past, assumed a different shape. Claims formerly worked on a small scale have mostly got into the hands of large and partly foreign companies, who are working not only extensively, but systematically, and more with a view to later than immediate profits.

BULLION.—During December, Wells, Fargo & Co. shipped from their office in this city the following amounts of bullion: West, 9 bars, valued at \$19,999 39; East, 116 bars, \$138,587 31; total, 125 bars, valued at \$158,586.70.

[For want of space we omit, this week, further notice of White Pine.—EBS. PRESS.]

Arizona.

ITEMS.—Prescott *Miner*, Dec. 24th: On the Rainbow lode, an incline tunnel of 35 feet struck the ledge, and shows 2½ feet of ore, a great deal of which will yield \$1 to the pound. The owners have another tunnel in 125 feet. In Martinez district prospects are favorable. The ore from the Mayflower will be crushed at Wickenburg. Work has been commenced on the Queen of Palmyra and Gnomes lodes. Messrs. McCrackin, Owens, Hammond and Poland, returned from the Bradshaw mts., Monday. They report the chances of success flattering. New and rich lodes are constantly being found. Curry & Moreland had sunk 30 feet, and had 2½ feet of rich ore. The Del Pasco shaft turns out extremely rich rock. The owners are timbering the shaft. The party south of Silver Mountain found fair prospects—one piece weighing eighty cents. In Hassayampa district, there are about 30 men placer mining. On Lynx Creek, Shelton had taken \$1,000 from eight wheel-barrow loads of decomposed ore from the Vernon. Uncle Billy Pointer was getting better ore than ever.

Idaho.

ITEMS.—*Avantache*, Dec. 17th: Golden Chariot receipts for November were \$76,187 71. They are keeping the Webfoot mill running on Mahogany ore, and has had 50 tons worked at the Cosmos, which yielded \$51 per ton. This may be considered average ore. The Belle Peck shaft is down 45 feet, showing the ledge to be of an average width of ten inches, containing rich sulphurets of silver besides gold. The new Chariot hoisting works are being put up, and the old machinery will be removed to the Peck & Porter. Good looking ore is taken from the Oro Fino, and operations continue on the Illinois Central, Skookum and Chipmunk.

Montana.

CABLE CITY.—Deer Lodge *Independent*, Dec. 17th: The survey of the new ditch has been completed, and the contract will be let in a few days. The Cameron mill is pounding out gold at the rate of \$1,000 per day.

HIGHLAND.—John Anderson says there are but five companies at work on the placer mines, and that they are only doing tolerably well. Nevens & Fair have completed the tunnel to the Nevues ledge, and have in sight a large body of very rich ore.

GIMLET GULCH.—This has paid well all season, \$100 to a single rocker was made in one day.

JEFFERSON GULCH.—The Ruhl Bros., after working all Summer on ground that paid only \$6 per day, started a new cut and cleaned up from one pit \$900. This was an average of \$15 per haul. But the best claim is the Harris Bros., averaging from \$7 to \$13 per day all the season.

WHITLATCH CO.—*Helena Gazette*, Dec. 21: Yesterday Mr. McClure furnished us the result of a run on 225 tons of quartz from

the Parkinson lode: Number of ounces, 322.48; 798 fine; value of bullion, \$5,319.66—a little over thirty dollars to the ton.

PHILIPSBURG.—*New North West*, Dec. 16th: The mill starts Monday if the quicksilver arrives. Manager Plaisted thinks he will have Hope rock enough all winter. Other parties are preparing to take out milling ores. The C. S. S. Co.'s Smelters, have dried up for alterations; will start again in ten days. They run out two tons in the last ditch; are confident as ever of success.

MOOSE CREEK.—The Harvey lode shows a six-foot crevice of \$200 ore. The Day lode has an incline 100 feet in and has a splendid body of ore showing native silver.

FOREST CITY.—Missoula *Pioneer*, Dec. 1: On Nos. 61 and 62, with a couple of drifters, 250 ounces of gold were taken out after a week's run.

KADERSBURG.—*Cor. of Montanian*, Dec. 22d: The Keating lode never looked so promising as at present. We have our levels driven 500 feet. We started our mill on the 6th inst., and we don't expect to stop it for two years. Jacob Nave's ground, on the Iron Clad lode, shows a vein of black iron ore 5 feet in thickness, which is paying \$25 to \$30 per ton.

Mining Stocks.

SAN FRANCISCO, Thursday Eve., Jan. 5.

The Mining Share Market has been irregular during the past two weeks, in which time have occurred the two holidays of Christmas and New Year's Day, to interrupt the usual course of business. Our review extends from the 22d of December, our last date, to this present day.

Alpha has been in the market only twice, selling at 5. Amador has sold a couple at times at 280 each. Belcher has varied from 6¼ to 8. An assessment of \$1 per share became delinquent on Tuesday. Chollar-Potosi has sold between 68½ and 75, closing this morning at 74 to 74½. Last week 1,700 tons of ore were extracted from the mine, which averaged \$70.10. The company report \$362,458 on December account. Crown Point has been lively at 15 to 17½, rising to-day to 18½. Last week, 265 tons of ore were raised, valued at \$6,689. Daney has declined from 6¼ to 6, with but little demand. The engine shaft and pump were completed on the 24th ult., when drifting for the vein had commenced.

Eureka has been quoted on two days, at 370 and 375 to 380. A dividend of \$10 per share for December has been declared, payable on Saturday. Eureka Consolidated has been quite lively at 15½ to 16½. Golden Chariot has fluctuated greatly. It commenced at 87, fell to 72, rose to 79½ to fall again to 64½, and then came up again to 72½. In December, bullion shipments of \$46,227 were made. The December dividend was omitted, but one of \$4 per share has been declared this month, payable on the 10th.

Gould and Curry has been a variable stock, but has had a general fall from 75 to 45 in the last two weeks. A summary of the annual report will be found below. Hale and Norcross has sold from 110 to 96, selling to-day at 103. Last week 900 tons were taken from the mine. Ida Elmore has varied from 17 to 14, and Imperial from 17 to 11 last week and 11 to 22½ this week. Kentuck sold at 30 to 35.

Meadow Valley has sold largely, as usual, and at prices varying from 20½ to 28. Ophir fell from 5½ to 2¼ and then rose to 4¼. Mammoth has sold from 25 to 35 cents; Original Hidden Treasure from 6 to 7, dropping to-day to 3. Overman has varied from 4¾ to 2¼. Nearly \$40,000 were received from the mine in December. Savage has sold in large amounts, from 41¼ to 56. Last week 1,200 tons of ore were raised, assaying \$46.94 per ton. Sierra Nevada has ranged from 20½ to 18, Yellow Jacket from 39 to 48½. The latter company have to-day declared a dividend of \$2 per share, payable on the 10th, their first for 22 months. The last dividend paid was one of \$5 per share, March 15, 1869. The fire in April of that year stopped further dividends.

The coinage at the San Francisco Branch Mint for December amounted to \$1,676,000, in double eagles, eagles and half-dollars. The value of the deposits of refined gold and silver during the past year amounts to \$16,644,462.93.

GOULD AND CURRY.

The annual meeting of this company was held last week, when Alpheus Bull, Wm. Norris, A. K. P. Harman, C. L. Weller, B. F. Sherwood, R. F. Morrow and J. D. Fry were

electd Trustees. The Secretary's report shows the following:

RECEIPTS.	
From 23,499 tons ore worked at Custom mill.....	\$661,013
Premiums, sale of Shutes, etc.....	6,891
Sale of 208 tons ore.....	1,677
Assessments.....	132,000
Sundry mill material sold.....	13,387
Returned freights V. & T. R. R. Co.....	5,068
Miscellaneous.....	1,086
Total.....	\$19,092
DISBURSEMENTS.	
Cash indebtedness, Nov. 30, 1869.....	\$29,934
Dividends to stockholders.....	48,000
Labor at mine.....	229,399
Timber and Lumber.....	59,978
Iron, Hardware, Charcoal, etc.....	39,175
Machinery and Foundry work.....	16,387
Candles.....	4,940
Sundries on account of mine.....	14,531
Mill account.....	4,338
Shipping 23,194 tons ore Custom mill.....	302,063
Taxes.....	6,576
Exchange.....	2,934
General expenses.....	22,211
Interest.....	2,665
Miscellaneous items.....	8,482
Total disbursements.....	\$792,240
Cash on hand November 30, 1870.....	26,852
Total.....	\$319,092

The assets of the company aggregate \$203,614, against which there are liabilities amounting to only \$2,629. The Superintendent reports 24,305 tons of ore taken from the mine during the year, averaging \$28.16 per ton. All this ore was from the old portion of the mine. A large and valuable deposit was discovered at the Potosi section, and other bodies of ore are expected in the northern part of the mine, towards which explorations are now being made. No estimate of the present quantity of ore in the mine has been made, owing to the irregularity of the deposits. An aggregate of 11,358 feet of drift has been run, and 1,953 feet of old drifts re-opened and repaired. The upper 400 feet of the shaft will have to be retimbered without delay.

This President's report gives the following table of ore production, average yield, cost of extraction and of reduction per ton. The cost of milling certainly seems high notwithstanding the assertion that, but for this unusual proportion of first class ore worked, the operating expenses this year would have presented a still more favorable comparison.

	Ore, tons.	Yield.	Mining.	Milling.
1870.....	24,305	\$28 16	\$6 82	\$12 85
1869.....	15,879	26 30	7 29	13 08
1868.....	12,153	18 14	3 73	12 62

According to this same report the total product and expenses of the company for the past three financial years have been as follows.

	Product.	Expenses.
1868.....	\$102,054	\$209,307
1869.....	308,855	395,923
1870.....	690,104	688,539

DIVIDENDS.

During December, dividends were paid by various mining companies as follows:—Black Diamond Coal Co., ¼ per cent, \$25,000; Natoma Water and M. Co., 1 per cent, \$3,000; Chollar Potosi, \$5 per share, \$140,000; Eureka, \$10, \$40,000; Golden Rule, 50 cents, \$1,500; Hale and Norcross, \$5, \$40,000; Meadow Valley, \$1.50, \$90,000; North Star, \$2, \$6,000; Sierra Nevada, \$1, 15,000. Total December, 1870, \$360,500; 1868, \$184,000; 1867, \$221,000.

We compile from the *Bulletin* the following dividends paid by mining companies in this city during this year 1870.

1. Amador.....	\$155,400
2. Argenta.....	21,000
3. Black Diamond Coal.....	300,000
4. Chollar Potosi.....	658,000
5. Eureka.....	430,000
6. Golden Chariot.....	75,000
7. Golden Rule.....	3,000
8. Gould & Curry.....	48,000
9. Hale & Norcross.....	504,000
10. Ida Elmore.....	20,000
11. Kentuck.....	30,000
12. Meadow Valley.....	150,000
13. Metropolitan Mill.....	10,000
14. Natoma Water and M.....	6,000
15. North Star.....	16,500
16. Original Hidden Treasure.....	32,000
17. Sierra Nevada.....	37,500
18. Union.....	30,000
19. Wheeler.....	6,000

Total.....	\$2,532,400
Other City Incorporations.....	5,641,002
	\$8,173,402

"If to this amount were added the net profits of the private and foreign banks of the city and the returns to stockholders of other local incorporations, we have no doubt that the grand total would reach \$10,000,000, which speaks well for the prosperity of these several institutions for the year 1870."

AGRICULTURAL INDUSTRY

Cotton Culture in California.—No. 1.

BY JOHN L. STRONG.
[Written for the Press.]

It is difficult to define the precise limits within which cotton may be successfully produced in California. With reference to climate, the isothermal lines may be taken as safe latitudinal boundaries.

Reference to a physical atlas will disclose the fact that nearly the entire state lies within the cotton zone. At latitude 36° the isothermal line of 60°—which is assumed as the northern boundary of the "cotton belt" of the United States—curves northward. Following the western slope of the Sierra Nevada, it extends beyond the 40th parallel at Fort Heath, and then curves downward again following the eastern slope of the Coast Range mountains until it reaches the Santa Barbara islands, where it again turns northward.

Limiting the southern boundary of the "cotton belt" of the United States to the isothermal line of 70°, we descend, in California, to San Diego. The question of profitable production on the vast arid plains embraced in this region must be determined by practical tests in the future. One test made in 1870 on these plains in Merced county, with seed sent from the writer's plantation on the Mississippi river, resulted in a fine yield of cotton; while corn planted beside it perished from the effects of drought. But leaving out these arid plains, there remains an immense area within which corn is now successfully and profitably produced, without irrigation. We may safely assert, that wherever corn can be grown without irrigation, cotton will be a profitable crop, supposing the interval between spring and autumn frosts to be sufficiently long to admit of its maturing. This necessary interval may be stated to lie between the 1st of May and the 15th of October. The October frost is supposed to be a freeze, such as will harden the earth and blight all vegetation—"a killing frost." A light frost, which only causes the leaves to drop and dries up the sap in the stalk, is beneficial to cotton in hastening maturity. On all such land as above described, that will return to the planter a yield of 30 bushels of corn, per acre, he may safely calculate to gather 500 pounds of lint cotton per acre.

The importance of the successful inauguration of cotton production to the future prosperity of California, cannot be over estimated. A stranger, traversing the state, finds labor without employment from the time the grain crop is planted until the harvest begins; and from the close of the harvesting season until planting is resumed. In the intervals which elapse between these two working seasons, an idle population haunts the villages, towns, and cities, and the fruits of idleness are everywhere visible. To the amelioration of the condition of the working classes, the efforts of the wise and good are constantly directed; and he who succeeds in such efforts deserves the benison of his kind. It is said with truth, that "he who causes two blades of grass to grow where but one grew before, is mightier than the conqueror of a city." With how much greater emphasis may it be said of him who calls into existence a great industrial enterprise, profitably employing idle populations, repressing thereby vice and crime, and giving a mighty impetus to the development of the prosperity and wealth of the state. It is in this spirit, and with no meaner purpose than that the writer has sought to introduce the culture of cotton in California. Whether his efforts be successful or not, he claims the merit of unselfish endeavor.

The rules which govern the true and scientific culture of the cotton plant are general, and are, therefore, to a certain extent applicable to all conditions of climate and soil. All general rules are subject to modification. In culture—and especially in that which claims to rest upon a scientific basis—these modifications are determined by the tests of practical experience—the safest of guides. Practical tests develop the peculiarities of climate and soil. Thus while the general principles which govern culture in the moist region of the Mississippi river bottom, are the same as those which must be adopted, in practice, in the dry climate of California, practical experience teaches us that there are special differences in both climate and soil which render necessary changes in the prevailing systems of preparation, planting, and cultivation of that region, in order to insure success in our own.

The true principles of culture in both climates involve a thorough preparation for

planting, by deep breaking and perfect pulverization of the soil. It is rendered necessary by the nature of the cotton plant, which neither climate nor soil can change. Depending for sustenance upon one main or *tap root*, which strikes down deep into the earth in search of nourishment, its downward progress must be unobstructed; else to the extent of that obstruction its perfect development is retarded. But in the climate where the abundant moisture generated by the "Gulf Stream" is diffused, the water in the planting season, often lies upon the surface for two or three days consecutively, even though the soil be broken to the depth of ten inches or more. Hence the necessity for planting upon "raised beds." For the germination of the seed the plant requires a generous warmth.

In our dry climate, on the contrary, the absence of precipitation during the planting season admits of level planting, in fact demands it. While the variable climate of the Atlantic States affords the planter no certain criterion upon which to base his plans for cultivation, we have uniform and changeless seasons. In the one case, there may be alternate floods of rain and parching droughts; in the other a single principle governs your system—that of providing for the absorption of the greatest quantity of moisture and its gradual exhaustion to supply the even development of the plant.

We lay down then, as an inflexible rule for the observance of the California planter—level planting.

The soil should be first broken to the greatest possible depth, then thoroughly harrowed. The land is thus prepared to absorb all the moisture that falls. The soil is made light, loose, and is readily warmed by the sun, and a rapid germination insured when the seed is deposited.

The rows should be "marked off" in spaces. A rule which will apply almost universally is—four feet each way. But this is subject to modification in the case of very strong soils, where the plants should have more distance—say five feet east and west, and three feet north and south. The time for planting will be as early as possible after the latest frosts of spring.

The seed must be deposited in the checks, by hand, from eight to ten seed in each check. The best and simplest method of carrying the seed, is to have the hand or laborer who plants the seed, wear a long apron made of burlaps or some cheap, coarse material, fastened around his neck by a strap. He will gather it over his left arm in the form of an open bag. This will be filled with seed and dropped by the right hand.

For covering the seed so dropped, either of two methods may be adopted. 1st. One hand may follow the sower with a hoe, covering carefully to the depth of from two to three inches, or 2nd. A harrow may be used, constructed as follows: Take a piece of 3 by 4 hard wood, 18 inches in length. Leave space in the center to fit on the stock of a common shovel plow; then fill with ordinary harrow teeth at intervals of one and a half inches. Run this over the rows covering the checks. This ends the work of planting.

BEE SUGAR.—The San Jose beet sugar enterprise is now in a fair way of going into early operation. A large amount of stock has already been taken, and arrangements have been made to procure seed for the spring planting. The enterprise may be considered as fairly inaugurated.

Sacramento has not given up the manufacture of beet-sugar. Machinery has been sent for, and the managers are determined to succeed.

CAREFUL FARMING PAYS.—Charles L. Sharpless is a farmer who carries the precision and exact noting of the counting-room, where he has amassed a great fortune, to the farm; and what he knows is valuable, because he can give his knowledge in figures. For instance, he says he can winter a cow in the best condition and at the greatest profit on this daily ration: Hay, 15 pounds; meal, 8 quarts; carrots, 4 quarts. He feeds about equal meals morning, noon and night. It is doubtful whether anybody has better Jersey cattle than Sharpless.

DOGS—WHAT IT COSTS TO KEEP THEM.—If all that the dogs of this country eat were fed to hogs, it would make \$50,000,000 worth of pork. And these dogs do no good, to say nothing of the 800,000 sheep they kill.

A Troy gardener has raised a grape crop of over 6,000 pounds on a space of less than 1,000 square feet.

California Agricultural Notes.

MORE MULTICAULIS TREES.—Dr. J. Strentzel, of the Alhambra Farm, in Contra Costa county, is planting 2,000 *morus moretti* mulberry trees and 1,500 *multicaulis* cuttings. Mr. John Thorpe, of Placer county, is also planting 2,000 mulberry trees—one-half of the *moretti* variety, and the other half *multicaulis*. A number of the neighbors of Mr. T. are also planting a less number each.

OPTUM CULTURE.—C. W. Reed, the well known orchardist and nursery man of Yolo county, is preparing to enter into opium culture this coming season.

IMPORTED PIG.—Cary & Mitchell, of Colusa, have a little pig which they have just imported from St. Louis, two and a half feet from "tip to tip," which weighs 144 pounds.

COAL OIL FOR "SOAB."—Parties are using oil from the San Fernando oil springs, for the purpose of healing scab in sheep. It is said to be an excellent remedy.

WOOL STATISTICS.—The statistics of the San Francisco wool trade show a receipt of about twenty million pounds here besides what may have been retained for manufacture at the Marysville, Stockton, and other interior mills; and it is estimated that the increase next year will be fully 25 per cent.

BIG THINGS.—The San Diego Union has seen a beet weighing 61 pounds and a sweet potato weighing 17½ pounds, both from the Sweetwater Valley in that neighborhood. The latter was eaten a few days before the notice was made, and found to be mealy and sweet.

HOPS IN OAKLAND.—The Oakland News says that 4,600 pounds of hops, of excellent quality, were raised, the past season, on the Haas place, near the San Leandro bridge. This yield was from cuttings planted last February—the yield being about equal to that of old vines.

R. B. SMITH, Esq., who resides on the west side of the San Joaquin, in Stanislaus county, has already sown over 3,000 acres in wheat, and calculates before the seeding season is over to have in upward of 8,000 acres in grain.

STRAWBERRY PROFITS.—A widow lady, of Santa Cruz, received over \$500 for strawberries grown on half an acre of poorly tended ground last season. The cultivation and care of small fruits might be made both a pleasure and a profit to females in this State, as it already is in many of the Eastern States.

JEROME C. DAVIS, of Yolo county, has been sporting a pair of \$8,000 horses in Washington City. They have beaten 2:30.

A WILD GOOSE, of the "Honker" species, weighing 14 pounds and seven ounces, was shot in Tehama county, Dec. 20th.

GOLD IN THE CRAW.—A mallard duck, shot near Castroville, last week, had several particles of gold in its craw.

THE LOCHER STEAM PLOW AT WORK.—The Chico Enterprise says the Locher steam plow is engaged on the Henshaw ranch, in Hamilton township. Its work is thirty acres per day and ten inches of soil turned up. It is, we are glad to say, a success; and must result in a revolution in this item of agriculture in our county, as well as a handsome fortune to its proprietor.

Eastern Agricultural Notes.

LARGE POULTRY ESTABLISHMENT.—A man in Lowell, (Mass.) has built a poultry establishment capable of containing 3,000 hens.

SINGULAR FARM PRODUCT.—It is said that a farmer in Massachusetts made \$2,000, last year, by selling burdock roots.

It is said that pork will be lower this winter than for the past ten years, as the Western markets will be over-stocked.

WHEAT IN ILLINOIS.—Winter wheat is looking well in Illinois. The quantity sown this fall is much larger than heretofore. The prospect for the coming crop is the finest ever known in that section.

ILLINOIS IS SHIPPING MILK direct to New York City—six car-loads a month—but it is condensed first.

CHEESE MAKER'S CONVENTION.—Two thousand cheesemakers are expected to meet in convention in Utica, N. Y., on the 10th of this month. There will undoubtedly be some valuable talk there. Several prominent dairymen will deliver especial addresses.

POTATOES IN COLORADO.—Colorado seems to lead off in potatoes. A farmer on the Cache, near the new town of Greeley, reports a yield of 248 pounds of tubers from 1½ pounds of the Early Rose. The N. Y. Tribune doubts the report.

BEE SUGAR—A SUGGESTION.

The success of the Beet Sugar Factory in Alameda County is attracting the attention of capitalists and agriculturists in many parts of the state, and already there are companies forming in many localities for the purpose of purchasing land, planting beets and manufacturing sugar therefrom. We are glad to see this. It will be of great benefit to the state in many ways. We shall be glad to assist all such enterprises by disseminating reliable information concerning all departments of the business. We would mention a fact in this connection which shows a degree of wise prudence in the Alvarado Company, and which is at least suggestive to all other companies to be organized for similar purposes. Before purchasing their land and before expending much money anywhere, they sent a quantity of beets produced at or near their contemplated location to Illinois, where their present Superintendent was then engaged in a beet sugar factory, and had them manufactured. Thus they in advance obtained a demonstration that the beets grown at Alvarado were of good quality for sugar making.

Would it not be equally wise and prudent for other companies to avail themselves of the skill of the Superintendent and the machinery of the Alvarado Company to determine the character of the beets grown at their contemplated localities? We would like to see a test made with beets grown on alkaline soil.

ORANGES IN YOLO.—J. W. Snowball, of Knight's Landing, has left at the office of the Yolo Democrat some oranges raised by himself. That paper says: "Mr. Snowball has one tree 12 years old with a hundred oranges glistening upon its branches, and another 10 years old with quite a number; and we are informed that Mr. St. Louis, of the same place, has a thousand oranges now ripening. The question is not what can, but what cannot he raised in this county."

We would remark that we are well acquainted with both Snowball's farm and that of St. Louis, and know that they are no more protected from the north or south winds than are locations generally on the Sacramento River. We also know from personal experience that the orange tree will live and thrive well where the water will kill the peach, plum, apricot, nectarine and cherry. As this is the season for planting trees, the above hints should be read and remembered in connection with the above facts as stated by the Democrat. The orange tree will grow from the seed of any ripe orange as readily as the apple tree will grow from the seed of the apple.

ANNUAL WASTE OF IRON ON A FARM.—A London paper, sometime ago, made a calculation as to the amount of iron wasted in the cultivation of land. On a certain farm of 450 acres, it was found that there was an annual consumption of 4 pounds to the acre. But this was considered too high for the average, on account of special conditions, and the consumption generally was computed as between two and three pounds per acre yearly.

Eggs.—New York, we are told, devours about a million of eggs daily, which is one egg to each inhabitant. For about three cents per inhabitant, this great city deprives the country of three hundred and sixty-five millions of possible chickens yearly. We reflect on this fact every time we pay six bits for a descendent of a rooster.

THE POTATO had about as hard a time as the tobacco plant in its early introduction among European nations. For more than two centuries its use was strongly opposed, until at last Louis XV wore a branch of its flowers in public, and this royal sanction overcame popular prejudice and the consumption of the root became universal in France.

MISCELLANEOUS.

The Census of 1870.

The increase in the population of the United States during the last ten years is less than has been commonly supposed. The increase in our Pacific states, more especially in California, during the last year, has also been less than was expected previously, although it cannot be complained of. We publish the following comparative tables of population from the best sources at our command; and for reference they will be found particularly valuable. The figures have been carefully revised and corrected.

CALIFORNIA.

Counties.	1870.	1860.	Inc.	Dec.

Chicago has one hundred Protestant churches, two theological seminaries and two Universities, beside the Garret Biblical Institute; and yet its record of crimes places it among the worst cities of its size in the world!

The cows of San Jose have taken to swallowing gold coins of late. The inhabitants rejoice thereat, believing that the breed of golden calves will shortly increase.

Lake Tahoe.

[WRITTEN FOR THE PRESS.]

My wanderings having brought me to this beautiful spot, I have had an opportunity for resting a short time from my labors, and send you a few lines from this mountain lake. I left the rail-road at Truckee Station, at which point I arrived at 3.30 A. M., and thence came by stage to the lake.

Truckee is a famous lumber station. Here is a large number of saw-mills, steadily cutting the logs into proper shapes and sizes, and in quantities sufficient to supply the railroad and many districts along its line. Here a large planing mill has been in successful operation during the past year, and here a San Francisco party is about erecting large smelting works, this position having been chosen in great part on account of the abundance of fuel and the existence of the very best of water privileges.

From Truckee to Tahoe City, a distance of 15 miles, one has a delightful ride in the fine stages of Messrs. Burke and Campbell. The road leads through a pass in the Sierra and follows the windings of the Truckee. At Tahoe City we secure rooms at the excellent Tahoe House, kept by W. B. Lyon, and then wander out to enjoy the fine scenery. Here is one of the grandest of all mountain lakes, stretching out 35 miles in length and fifteen in breadth, and hemmed in by snow-capped heights.

From our host of the Tahoe House we can procure horses for riding or boats for a sail. Embarked on the lake we can visit Carnelian Bay, to seek for agates, or Sugar Pine Point, or the Glenbrook House, or a hundred other delightful localities. Or we can fish with rod and line, or (at night) with spears and torches. Three varieties of trout,—the silver, the speckled, and the black, as they are called,—the white fish, and other kinds, give us delightful sport on the clearest and purest of all waters. The largest fish ever captured in this lake, as far as known, was taken out last year, and weighed 29 pounds. This was sent on to President Grant.

Boats on the Lake—Hot Springs.

There are two schooners on the lake, of about 20 tons each, for pleasure parties. Messrs. Howland and Coy have a small steamer, the "Truckee," for the same purpose. It is 40 feet long, 9 feet beam, and will carry some 50 passengers. The boat was built by A. Rewrick and cost \$2,500. The 15-horse power engine and other machinery was manufactured by Lockhead and Co., of San Francisco. The "Emerald," another small steamer, 46 feet long and 10 feet beam, was sent up to the lake by Ben Holladay. The engine has been taken out, and a new one is to be put in, and everything made complete for next season.

Near the mouth of the Truckee River, I noticed still another steamer being built, which will cost about \$15,000, and which will be the largest on the lake,—100 feet long and 20 feet beam, with a 70-horse engine. This is owned by H. Burk, Esq., and is to be a ferry boat for the transportation of passengers, wagons, etc., to different points on the lake. It is a side-wheel-er, is constructed of the pine timber found in the vicinity, and will be finished next June. The builder is Mr. A. Rewrick.

Mr. W. B. Campbell owns a very pleasant place here known as the Hot Springs, where he is building a fine hotel and cosy cottages for the accommodation of families and parties visiting the lake. He is providing every accommodation, and the hot baths added are quite a feature. With all the improvements, this will be a most delightful place for a summer resort.

There can be no real, complete enjoyment without due attention to bodily comforts. If my notes are mostly concerning the preparations made for the last, they are no less valuable and hardly less interesting than if they were only concerning the natural beauties of the place. Perhaps months of travel may have had something to do with the tone of my letter, making it less romantic and more statistical with regard to the creature comforts. Still I think they will prove acceptable to the reader, although not quite after the general order of such letters.

Lake Donner.

Quite different from Lake Tahoe, yet not less interesting, is Donner Lake. Only 3½ miles long and one mile wide, it still has a peculiar beauty of its own, which causes one to hesitate long before awarding it a second place. Formed by the side and terminal moraines of an old glacier, hemmed in by woods and mountains, with its own natural curiosities and its own historical tragedy, well stocked with fish, and with pleasant hotels, it will ever attract many visitors who seek for the beautiful.

The tragedy which gave name to the lake has been widely told, yet may be new to some of your readers. About a quarter of a mile from the Grant House are still to be seen the indications of a cabin. Here a party of immigrants, from Illinois, were imprisoned by the snow in 1846.

Notices to Correspondents.

K. P. PLOWMAN, Idaho, asks:—"How much water can be run through an 11-inch pipe, 680 feet long, with a ten-foot pressure? The bend will be 80 feet." We do not understand exactly what is meant by the last sentence. The item of importance in bends is the angle. Leaving this out of consideration, we may use, as sufficiently accurate, the simple formula:

$$(3d)^5 \times h = G^2$$

Here d equals the pipe-diameter in inches; h , the pressure in feet; l , the length in yards; and G the number of gallons discharged per minute. This formula gives us 1,213 gallons (nearly) as our answer, for a straight pipe. But the bend will decrease this result, a sharp angle giving less than an obtuse one.

Greenbacks at Par!

Until February 1st, 1871, parties sending to this office direct for old or new subscription, *strictly in advance*, the sum of \$4 in currency, will receive credit for the Press, for one year. This will *not* apply to payments made otherwise than in advance, or to agents who have travelling expenses to pay and who save to subscribers the expense of remitting.

Send at Once!

Subscribers whose term for the Press expires with this number will greatly oblige by remitting at once, before their names are taken from our printed list.

No PAPER LAST WEEK.—As announced in our paper of December 24th, we made no regular issue of the Press on December 31st, having already completed the two full volumes of 52 numbers, for 1870, on the former date. We are thereby enabled to commence our new volume in the new year, instead of on the 53d Saturday of the old year.

Smelting Works—Ore Shipments.

The erection of smelting works has become quite a mania since our interior mines have commenced producing large amounts of ore proper for treatment in the furnace. Leaving out of account the many places where small works have been put up for local purposes, we find projects agitated, and in some instances carried out, in several large commercial centers, for building works for treating ores derived from a large range of country. Omaha has her furnaces, Chicago, St. Louis, Kansas City and other places propose having theirs, and San Francisco talks of one or two establishments in addition to what she already has.

It is easy to see that many of these projects must fail. Some cities want proper fuel and material; others are not well situated with regard to the mines; and in almost all the instances which we know of, the projectors have no idea of the amount of capital requisite for such an undertaking. There are three prominent requisites which now occur to our mind:—a central location (easy of access from a large number of producing mines, with a market for the products of smelting, with plenty of water, fuel, building material, etc., and with cheap labor); a good experienced metallurgist to conduct the operations; a good financial management and *plenty of capital*.

While the other conditions are readily granted on all sides, the last is apt to be overlooked. Possibly the miner may, on first thoughts, imagine that our insisting particularly on this point, is favoring monopoly. Such a thing is far from our thoughts. We do not deprecate competition in smelting, but we do deprecate starting in without any good prospect of success. We find parties talking of putting up works with capitals varying from \$10,000 to \$50,000. While we might advise this where the furnaces are at the mines and for a limited number, we hold it to be absurd for establishments in large cities which expect to treat ores from many places,—as in San Francisco, Chicago, or the like. We think anyone who examines the case fully, must agree with us. We find a strong backer in the *Colorado Register*, which shows excellent sense in the matter, and which we are here glad to quote. Speaking of a proposition to erect furnaces at Chicago with \$25,000 "to commence with," the editor remarks;—[from this estimate of \$25,000, the Chicago party] "must have inadvertently dropped a nought. \$250,000 would probably make a beginning, and but a beginning, as it will be found where estimates of cost of ground, power, buildings, furnaces, stacks, etc., are made. To put up smelting works in Chicago, to handle 24 tons per day, would so far go through \$250,000 as to leave a very small amount to be invested in ores. This latter item for works of this size and class should not be less than \$200,000 of itself. It is believed that the Boston and Colorado works, at Black Hawk, have not less than \$200,000 constantly locked up in ores and matt, while at present the capacity is but 16 tons per day. This accumulation of ore is necessary here in order to make combinations favorable for cheap smelting. In Chicago the same would be true, with the additional consideration of the distance from the source of supply." Without endorsing the exact figures given above, we believe that our Colorado friend is on the right track.

No smelting works, of the kind we refer to, can expect success, unless they are on a large scale. This is necessary in order to be able to smelt economically (by having a variety of ores on hand), and thus give the miner a fair return for his ore, and to live through dull times and through competition. A dozen small works will merely eat one another up by their rivalry. Such works must be able to treat all sorts of ores, to separate the bullion, etc. They

must be of a capacity sufficient to accommodate a large extent of territory, that the failure of one source of supply will not close them up. To erect and run such works, and not to be crippled by the sums "locked up" in the material on hand, a large capital is requisite. Balbach's works at Newark, New Jersey, have been unable to give our interior miners any sort of satisfaction.

Descending from generalities, we propose saying a few words about the proposed new works in this city. We have already one large establishment, Mr. Selby's, and the question occurs whether we have room for any more. We believe that we have—for at least one *large* establishment; but small ones will do no good. They will only injure for a time the present works, which injury will ultimately fall on the poor miner, who will be obliged to make reparation by getting lower prices hereafter. But we advise any parties desiring to erect furnaces here to put in plenty of capital. How much is required for Mr. Selby's works? No *small* amount, we are ready to guarantee.

Our reasons for believing that other works can flourish here are various. Already we receive large supplies of ore, enough to keep the North Beach furnaces at work, besides exporting considerable amounts. But miners find that it is more profitable to have their ores treated here, on account of the speedier returns, etc. And the greater the smelting facilities in our city, the greater our supply will be. The following table of ore and bullion importations to San Francisco during the last twelve months, over the C. P. R. R. and from the southern country, will be of interest as showing what our supply has been, and how it has increased. We believe that this is the first time any such tables have been published. The columns headed "Interior" give the amounts received over the railroad; those headed "South," the amounts from the southern country:

	ORE.		BULLION.	
	Interior.	South.	Interior.	South.
	tons lbs.	tons lbs.	tons lbs.	tons lbs.

December.....	382 600	2 600	323 1,200	118 600
Totals.....	4,537 600	247 1,500	1,681 700	724 300

Average, per month: Ore, 398 tons 1,508 lbs; Bullion, 200 tons 916½ lbs.

If we calculate that there are 300 working days, for smelting works, in the year (which number is in excess of the reality) we have an average of nearly 18 tons of ore and over 8 tons in bullion per working day, for the year. But this average does not give a fair representation of the existing state of affairs, for the smaller shipments at the beginning of the year bring down the average. A fairer idea will be given by taking the average of the four quarters of the year, with 75 working days in each quarter. We have then—

	ORE.	BULLION.
	5 tons 1,238 lbs.	2 tons 465 lbs.
Jan. to Mar.....	11 " 1,445 "	5 " 337 "
April to June.....	20 " 54 "	19 " 304 "
July to Sept.....	26 " 912 "	14 " 1,111 "
Oct. to Dec.....	26 " 912 "	14 " 1,111 "

The circumstance of the most interest and importance connected with these figures is the increase. That this increase has been due in great measure to our present smelting works cannot be doubted, and it is reasonable to suppose, as before remarked, that increased facilities will bring still greater supplies.

We cannot pursue the subject further at present. Our figures furnish data for those making calculations on the subject of establishing smelting works here. These figures are not over the true ones, and may be somewhat under them, but yet can not be far from the truth, being taken from the best authorities.

PATENTS & INVENTIONS.

Full List of U. S. Patents Issued to Pacific Coast Inventors.

[FROM OFFICIAL REPORTS TO DEWEY & CO., U. S. AND FOREIGN PATENT AGENTS, AND PUBLISHERS OF THE SCIENTIFIC PRESS.]

FOR THE WEEK ENDING DECEMBER 20TH.

HYDRAULIC MINING APPARATUS.—Frank H. Fisher, Nevada City, Cal.
HOSE-COUPPLING.—Conrad Locher, Oroville, Cal., assignor to himself and George C. Perkins, same place.
PUMP.—Nathaniel P. Sheldon, San Francisco, Cal.
GRAIN-SCOURER.—Austin Smith, Valmont, Colorado Territory.
EXPLOSIVE COMPOUND.—Joseph Hafenegger, San Francisco, Cal.
GANG-PLOW.—James Harris, San Francisco, Cal.
HANDLE FOR CUTLERY, TOOLS, &c.—John T. Haviland, San Francisco, Cal.
GUN-LOCK.—Edwin B. Hendee, San Francisco, Cal.
VEHICLE.—John D. Ross and Martin Keever Burke, Truckee, Cal.
PIPE AND TUBE FOR WATER AND GAS.—Henry M. Stow, San Francisco, Cal.

FOR THE WEEK ENDING DECEMBER 27TH.

GRAIN-SEPARATOR.—James W. Donaldson, Fairfield, Cal.
DEVICE FOR SIGHTING AND FIRING ORD-NANCE.—George K. Farrington, Alcatraz Island, Cal., assignor to himself, Lorenzo Hubbard, and C. W. M. Smith.
WASHING-MACHINE.—Balaam Chaffian, Lawson, Yolo county Cal.
NEEDLES AND THEIR CARRYING-ARMS FOR SEWING-MACHINES.—George A. Lloyd, San Francisco, Cal., assignor to himself, George W. Smiley, James McMechan, and Anthony Rosenfield.
HAY AND OTHER PRESSES.—Moses V. Northrup, Hornitos, Cal.
SEED-SOWER.—Samuel H. Sheplar, San Francisco, Cal., and William G. Conklin, Portland, Oregon.
PORTABLE SHIELD FOR INFANTRY AND ARTILLERY.—Harde Spears, Snow Hill, Cal.

EXTENSION OF BUSINESS—TWO PAPERS.

The rapidly increasing circulation of the SCIENTIFIC PRESS, and the broad field which it had undertaken to fill, suggested, some months since, to the publishers of that paper the propriety of issuing *two editions*—one for the mining and the other for the farming interests of the Pacific Coast. The success of that enterprise has been beyond our most sanguine anticipations; and now, at the urgent solicitations of numerous friends and correspondents we have determined to give a still greater distinctiveness to our efforts in behalf of these two leading industries of this coast, by advancing the two *editions* to separate and independent journals.

The SCIENTIFIC PRESS will continue, as heretofore, to represent and encourage the Mining Interest, while our Agricultural Industry will be represented and sustained by the PACIFIC RURAL PRESS, the first regular number of which is to-day presented.

The acknowledged advantages already derived from our late system of two separate editions will be greatly enhanced by the issue of two independent journals, and each class of our readers will receive additional benefits; while from the words of encouragement and assurance which we are constantly receiving, we feel the fullest confidence of still larger and more numerous accessions to our list of readers and subscribers than we have been favored with heretofore.

Of course much of the miscellaneous matter which usually appears in the SCIENTIFIC PRESS, is equally appropriate for the PACIFIC RURAL, and will accordingly appear in both journals, for we shall not be able to find anything better. Either paper will be served to subscribers, as they may desire. Both are of the same size and price, and the yearly volumes will commence and expire at the same time; hence

no difficulty or confusion will arise at any time by transferring names from one subscription list to the other.

Many of those who are now forming or are about to commence the forming of clubs for the PACIFIC RURAL PRESS will notice that this arrangement may greatly facilitate their efforts, as their lists may include names for both papers.

To this brief preliminary announcement of enlargement of business we will only add that the prospects of the SCIENTIFIC PRESS were never so brilliant as now, and our ratio of increase of subscription never so large, notwithstanding the great depression in business which has so long prevailed.

All who have visited us within the past few months will bear us out in saying our office presents a busy scene in its every department, whether in our Patent, Editorial, Printing or Engraving Rooms. The efforts to keep pace with the increasing demands of business are taxing the energies of the publishers and their various corps of assistants to their utmost. But we are never weary of well doing, and shall still continue, as heretofore, to do all in our power to interest and instruct our readers.

Notes on Contributions to Our Cabinet.

Some three or four weeks ago, a kind friend left on the editor's desk, during his absence, a package of specimens (one marked Julian District and others with merely the names of certain lodes) with the promise to call in again and give further information. As, however, we have since seen nothing of the donor, we have been unable to give a full description of the ores under this head. We wish to mention this fact in this connection, as we sometimes receive specimens with no information as to locality or donor, and for this reason the giver may be disappointed at not seeing them noticed at the proper time. Our friends will please remember to add the locality, name of donor, and other facts, in sending us contributions.

Nos. 510 to 512—Mr. J. W. Thurman, of Howland & Co., ore crushers and samplers of this city, presents us with these specimens. No. 510 is a beautiful specimen of copper ore, from Toano, Copper Cañon, Nevada, and is principally native copper and red oxide of copper. No. 511 is silver ore from the Shamrock mine, East Canon, Nevada, which shows on its face little else than rather decomposed rock (limestone), but which is said to be rich. No. 512 is a fine specimen of petrified pine wood, dug out, far below the surface of the ground, in running a tunnel near Virginia City, Nevada.

No. 513—Comes from Volcano, Amador county, and was presented by Mr. R. E. Thompson. It is one of those boulders of silicified rock, so common in that locality, outside smooth and polished, and internally with cavities, formerly occupied by large crystals of some mineral, now lined with handsome bunches of small quartz crystals which have a rich brown tinge as if from the presence of a little iron oxide. In places the quartz is in banded layers as in jasper. On breaking these boulders open, water is invariably found, we are told, in the cavities. It might lead to highly interesting results to have this "water" analyzed, as the presence of the crystals denotes the presence in solution of substances which by crystallization give us the various forms found. The smoothness of the exterior of the boulders denotes transportation from a distance, and the presence of the water is itself an interesting occurrence.

We have received some fine specimens from C. H. Aron, which will be noticed at our earliest opportunity.

Gear's Variety Molding Machine.

Nature has provided us most bounteously with forest trees of the largest size and of the finest descriptions on this coast. With the raw material furnished so profusely, our lumber trade is taking large proportions, and the working of wood is becoming one of our most important branches of industry. Hence any machine for wood-work which promises well, is of interest to a large class of our readers.

One of the most important of the many new labor-saving machines of this class which have been introduced during the past 15 years, is the Variety Molder, commonly known as the Shaping Machine.

This machine was invented by Nathaniel Gear, and after considerable litigation, was perfected and improved upon by himself and brother, John Gear, of New Haven, Conn. The machines are now built by A. S. & John Gear & Co., at Concord, N. H., who have bought up and consolidated all the patents. The illustration represents the machine with one of the patent feed attachments, which, though a valuable improvement for certain work, is not so generally used. The great value of the machine consists in the combination head (as

These machines are now built in three sizes, to accommodate the various work required of them. Parties interested in their purchase are referred to Messrs. Berry & Place, the agents in this city of the manufacturers, who keep the different sizes on exhibition at their machinery warehouses, 112 and 114 California street, and who doubtless will be pleased to give any further information required.

Academy of Sciences.

Annual Election—Reports.

The annual meeting of the Academy was held on Tuesday. The reports of the Librarian, Treasurer and Director of the Museum were presented, and the President delivered an address on the past and present position and future prospects of the Society. The reports were on the whole of a satisfactory nature. The matter of increased and better accommodations for the collections was spoken of.

The election of officers was the principal business of the evening, and resulted as follows: President, Dr. James P. Blake; Vice-President, Prof. George Davidson; Secretary, Dr. F. Hansom; Corresponding Secretary, H. P. Carleton; Treasurer, Elisha Brooks; Librarian, Dr. J. G. Coop-

The Mont Cenis Tunnel.

After ten years of hard toil under the greatest of difficulties, this mighty undertaking has achieved a grand success. The plan of bringing Italy and France into closer communication by means of a tunnel through the Alps, was suggested by Count Cavour in 1852, and put in shape in 1857; and although the project involved the greatest of engineering obstacles, the work was commenced actively in November, 1860. The Italian entrance is at Bardonnèche, and the French is at Modena, with a distance of over seven and a half miles between the two. The tunnel was to be 19 feet high and 25 feet wide, allowing a double line of railroad tracks. The obstacles arising from the location, (over 4,000 feet above the sea,) from the varying nature of the rock, the difficulty of getting proper drilling machines, the trouble of securing proper ventilation, etc., have seemed at times insurmountable. Twenty-five years were allowed for the completion of the work, and a temporary railroad was built in the meantime over the steep mountain sides. But man's skill and industry have triumphed over natural difficulties, and on the twenty-seventh of December, the parties

working from the opposite ends of the tunnel finally met, in less than one half the time thought possible previously.

This success will entail most important results. France benefits by this work to a very great extent. Its progress has awakened the jealousy of Prussia, and very probably that nation will now take active measures, as soon as possible, for its proposed tunnel, beneath the St. Gothard. Another tunnel from France, beneath

the Simplon has already been talked of, and we may now expect quite a tunneling furor, —or might, if the present European war were not causing such a tremendous run upon the national treasures.

THE ONLY COMPEND of gas lighting ever projected, is the work of a gentleman of this city. This work is the "Synopsis of British Gas Lighting," shortly to be published, the compilation of Mr. James R. Smedberg, consulting engineer of the S. F. Gas company. Believing that it deserves the hearty support of scientific men generally, as well as that of the gas companies, and feeling assured that it will be most valuable as a work of reference, we again call attention to it. It will be sold only by subscription, and our friends can have their names entered as subscribers by sending \$15 to the compiler.

MUSICAL.—The last series of concerts, given by the S. F. Musical Institute, must be pronounced remarkably successful. The excellent performances of Mr. Schmidt on the violin, the careful, accurate, clean playing of Fraulein Hoffmann, the singing of Mrs. Marriner (surer and better even than usual), the fine quartettes and quintettes, and the selections, as a general thing, have never been excelled before at any concerts which we have attended on the coast. Usually conservative in our laudation of such matters, we have no hesitation in bestowing praise here. We are glad to learn that this series was sufficiently successful pecuniarily to warrant the undertaking of another series, two of chamber music and two with a large orchestra, to commence on the 12th inst. We congratulate the directors for what they have accomplished, and hope that their new subscription lists may be speedily filled. May our musical public sustain them.

GEAR'S VARIETY MOLDING MACHINE.

shown on the left of the engraving), which is the foundation of the Gear patent, and without which the machine would be comparatively worthless. No other machine has this head or the intermediate collars which go with it.

To a practical mechanic the machine will be readily understood from the cut, and will need no explanation. We will simply state, then, some of the advantages claimed for the "Gear Shaper."

The cutters are held firmly in a simple manner, without the use of keys, wedges, screws or any other device than the ends of the knives and grooves into which they fit, and can be taken out, sharpened and replaced in one-eighth the time required to change cutters in other machines. Any length of cutters can be placed in the head, throwing the molding upon any part of the piece to be cut. Less time is required to set and adapt the cutters and heads to the desired forms, by the new and ingenious method of raising and falling the arbors. The cutter head is stronger than any other machine made, and the cutters cannot tremble. Any little vibration of the head does not affect the smoothness of the material planed. It is the only machine where the pattern is guided by the head itself, and if the head yields a little the pattern goes with it. The cutters cost less than cutters used in other machines, and are not weakened by holes and slots.

The shaping machine has revolutionized the business of cabinet making, and is unrivalled for molding furniture of all kinds. It is indispensable in the carriage and car shop, and is so common in all first-class planing mills as to be considered the *sine qua non* of a well regulated wood-working shop.

er; Director of Museum, H. G. Bloomer. Shell Mound—Colorado Desert.

Dr. Blake stated that he had examined a mound of shells at Lafayette, Contra Costa county. This was 18 miles from salt water, was composed of salt water shells, and probably the valley in the vicinity was formerly a salt water bay. A further examination is to be made.

Prof. Davidson quoted Col. Sedgwick to the effect that the elevation of New River, where it enters the Colorado, is 150 feet, up which the Ship of the Desert, lately the topic of so much discussion, must have ascended, if the asserted theory is true. If the ship is, as stated, 250 feet long, it must have a capacity of 2,000 tons.

SAMPLED.—We acknowledge the reception of a sample box of sugar from the Alameda Beet sugar factory, the like of which is now being manufactured at that establishment. We hail it as an evidence of the successful inauguration of a new and important productive industry on this coast. The sample before us is a beautiful article of granulated sugar, white as the driven snow and beautifully crystallized. No better sugar of the kind has ever been seen on this coast.

The product of the pioneer sugar works of California is now before the people of this coast. It is a very superior article, beyond all question, and can be furnished as cheap as that obtained from any other source. Consumers here should give the enterprise a helping hand, by calling for and using home made and home grown sugar, in preference to that of foreign growth. By so doing this business may be encouraged until we shall be able to produce all our own sugar, and thereby save some four millions of dollars that we now send abroad for this important necessity of life.

HOUSEHOLD READING.

Sunshine.

Sunshine is of almost as much importance in gaining or retaining health as good air. Who does not know how much more a bright and sunny day gladdens and invigorates both the strong and the weak than one overcast with clouds? Let the bright sun shine into your dwellings; draw the curtains and swing back the blinds that the sun may dry up the dampness which feeds the mould and fungus that breeds disease; that drives the rose tint from the face and lips. Let the glorious sunshine have free access to every part of your house where it is possible for it to enter. It will bring light and life, and sometimes imparts vigor when all other means fail.

The nations of antiquity seem to have understood and appreciated the blessings of sunlight far more than we moderns do. The most refined of those nations generally held their public meetings in the open air. Their schools were for the most part in groves or in porticoes—colonades, supported upon lofty pillars, beneath which the air and sunlight had the freest access. The magnificent Coliseum of Rome was without a roof. Little is the wonder that many of them, in the simplicity of their understanding, were induced to pay divine honors to the sun, as the source of life, light and heat.

Every lady exhibits wisdom and care in securing all possible available sunshine for her pet plants. She would sooner see them die than linger out a sickly existence in the shade. Sunlight and air are of no less importance to the beautiful, animated flowers of the household, than to the lillies, the geraniums and the fuchsias.

Too little attention is paid to this particular in the construction of our dwellings. Set them so that the sunlight will find its way into the largest possible number of rooms. Rooms upon the northerly side of houses can often be constructed with bay windows, or with recesses, by which a side light can enter, and the room be enlivened and warmed by the sun for a shorter or longer time. An hour's sunshine in a room is well worth arranging for. Secure every ray of the winter's sunshine that is possible, for the little ones and for the infirm and sick, who cannot go out of doors to reach it. Such persons, if kept in rooms with only north windows, will suffer as much from the lack of sunshine, as will plants which are compelled to vegetate in the shade. Let us give not only the feeble ones, but all and every one the fullest measure of sunshine.

HOW WE EAT AND DRINK.—Dr. Dio Lewis, in his "Talks about People's Stomachs," gives the following picture of the way in which too many Americans are in the habit of "bolting" their food at meals, and washing it down with floods of liquids: "Well, then, let me tell you, that during my six years' residence in America I saw nothing which surprised me so much as the way in which the Yankees eat and drink. Why, I really think it is worth an admission to stand at the end of a dining-room and see a hundred Yankees at the dinner table. Each one has something to eat in one hand and something to drink in the other. When the food hand goes up the drink hand comes down, and when the drink hand goes up the food hand comes down. It always reminded me of one of those walking beams on a steamboat—when one end is up the other end is down. Now, sir, I think that is the reason the American people are such dyspeptics. Why, sir, I believe that in a world's exhibition of dyspeptics your country would show more in number, and stronger in quality than all the rest of the world."

DOMESTIC ECONOMY is ascience—a theory of life which all sensible women ought to study and practice. No young lady is fit to be married until she has been thoroughly educated in the deep and profound mysteries of the kitchen. See to it, all ye who are mothers, that your daughters are accomplished by an experimental knowledge of good housekeeping.

A New Bread Fruit Tree.

Dr. Steven, of New York, writes as follows of a Bread Fruit tree which is a native of Brazil, and largely employed by them for food. The Dr. writes:—"The plant resembles very closely our sassafras; it has the same rough bark and the same palmate leaf. The food is derived from the root, and it probably produces a larger amount of food from a given area of ground than any other plant. A yield of 3,000, 4,000 or 5,000 bushels to the acre is not uncommon, and the cultivation is of the roughest kind. In fact, it has no cultivation, except planting. The universal South American knife, the machete, is used to cut a hole in the sod, the plant is inserted, and left to take its chance. It is sure to take its chance however. It will root out all other plants, and cannot itself be destroyed. The root is grated in mills, the milk flows away, and the pulp is dried for food. The milk is wasted by the hoghead. I have seen a river white with it for a long distance below the grating mill. This milk is poisonous, and it contains the saponaceous principle."

The ordinary bread fruit tree of the tropics, as is well known, produces a soft spongy fruit which is generally eaten as plucked from the tree. It may also be sliced and dried, and in that condition kept for quite a long time, and ground or pounded into a kind of flour or coarse meal.

THE TALLOW TREE.—A tree called the tallow tree, grows in China, the fruit of which contains a seed covered with a white, solid, fatty matter, which the natives convert into candles. It is proposed to introduce this tree into South Carolina, the south of France, and Algeria, where there is every prospect of its being successfully cultivated. In China it forms vast forests, and gives rise to a considerable branch of local commerce. The government of British India has introduced it throughout the different regions of the Peninsula, it now being ascertained that it grows equally as well in the Punjab and the north-west provinces as in China. The fatty matter produced by the tree favorably compares with the finest tallow, and when manufactured into candles, burns with a clear, white flame of great brilliancy, and emits neither smoke nor disagreeable odor.

The Way the Money Goes.

New York city spends \$8,500 per day for bread, and \$10,000 a day for cigars. The United States invests \$40,000,000 annually in the cigar trade alone, and \$600,000,000 annually for tobacco in other forms, including expense of producing. The annual expense to the human family is not less, yearly, than \$1,000,000,000. Liquor is sold in the United States amounting, in the year, to \$600,000,000, one-fifth the total amount of the National debt; or, according to Commissioner Wells, the total amount disposed of per annum is \$1,000,000,000, enough to pay the debt in three years.

It is time our wives, mothers and sisters, were alive to the importance of their influence upon this subject, and felt it their sacred duty to use every means in their power to keep this giant monster from ruining, not only the fortunes of many, but the souls and bodies of our best men and women! Only think of the vast amount of money expended in the actual degradation of mankind! And just imagine the suffering, disease, starvation and crime sure to follow the sale of liquor! The Chinese government will not license the sale of opium to its people, knowing its evil effects upon mankind; though a large revenue would accrue to the government by so doing. Would that our government were equally humane to its people. If woman has an influence upon society—and all admit that she has—let it be for its elevation, and let us begin now to make public opinion a temperance one—by voice, by pen and by example.

L. P. J.

ADVERSITY overcome is the brightest glory, and willingly undergone, the greatest virtue.

Household Receipts.

CORN BREAD.—AN ORIGINAL RECEIPT.—To make corn bread equally well without as with eggs was discovered by a California miner who recently communicated the method to us. Our friend occupied a "camp" and of course did his own "cooking." On one occasion finding himself short of meal for his corn bread, he eked it out by mixing therewith a quantity of cold "mush" which had been set aside from a previous meal. His astonishment was great at perceiving the decided improvement the previously cooked meal produced on his "corn bread." He repeated the experiment with the same result, and has since communicated the discovery to many, all of whom are unanimous in pronouncing cooked meal as good as eggs to make corn bread light. Mix liberally, say one third.

GOOD ROLLS.—The famous Parker House rolls are said to be made in the following described manner: Make a hole in two quarts of flour, and pour in one pint of curd milk that has been boiled, with a cup of butter melted in it. Add a quarter of a cup of sugar and half a cup of good yeast. Let it stand without mixing two or three hours. Salt to taste. Then knead it, and set it to rise a few hours; then mold it, and rise again in the pans before baking. The rolls require about fifteen minutes to bake in a quick oven.

SWEET APPLE PICKLES.—Three pounds of sugar, one quart of vinegar, one peck of apples. Dissolve the sugar in the vinegar, steam the apples until tender; let them boil up until clear in the sugar and vinegar. This is very nice for sauce.

TO KEEP MOTHS AWAY.—Take a piece of flannel, wet it with turpentine, and put among your woolen clothes and yarn.

COLD SOAP may be made as follows:—20 pounds of grease, 22 pounds of potash, three-quarters of a pound of rosin.

Mechanical Hints.

TO POLISH MARBLE, ETC.—Marble of any kind, alabaster, any hard stone, or glass may be repolished by rubbing it with a linen cloth dressed with oxide of tin (sold under the name of putty powder). For this purpose a couple or more folds of line should be fastened tight over a piece of wood, mat or otherwise, according to the form of the stone. To repolish a mantel-piece it should be first perfectly cleaned. This is best done by making a paste of lime, soda and water, well wetting the marble, and applying the paste. Then let it remain for a day or so, keeping it moist during the interval. When this paste has been removed the polishing may begin. Chips in the marble should be rubbed out first with emery and water. At every stage of polishing the linen and putty powder must be kept constantly wet. Glass, such as jewelers' show-counter cases, which become scratched, may be polished in the same way.—*Scientific American*.

TO BEND MAHOGANY OR WALNUT MOULDING.—Take two pieces of lumber, one to fit the inside, the other the outside of the moulding (the lumber of course cut to the curves required); soak the moulding in boiling water for ten minutes; then put it between the pieces of lumber; then cramp them together slowly bending the moulding; let it stand for three days; and it will be fit for use.

SPOTS ON MAHOGANY.—Stains and spots may be taken out of mahogany with a little aquafortis or oxalic acid and water, rubbing the part by means of cork, till the color is restored; observing afterwards to wash the wood well with water, and to dry and polish as usual.

WHITE POLISH FOR LIGHT WOODS.—Take white (bleached) shellack, 3 oz.; white gum benzoine, 1 oz.; gum sandarac, $\frac{1}{2}$ oz.; spirits of wine or naphtha, 1 pint, in which to dissolve.

OIL CLOTHS.—To ruin them—clean them with hot water or soap-suds, and leave them half-wiped, and they will look very bright while wet and very dingy and dirty when dry, and soon crack and peel off. But if you wish to preserve them, and have them look new and nice, wash them with soft flannel and luke-warm water, and wipe thoroughly dry. If you want them to look extra nice, after they are dry, drop a few spoonful of milk over them, and rub them with a small dry cloth.—*Western Rural*.

GOLD LIQUID is made by mixing bronze powder with gum water; a little spirits of wine will make it keep better. The proportions are easily ascertained by trial. Pieces of glass are put in the bottle to assist in shaking up the heavy powder, which would settle at the bottom.

Life Thoughts.

He that would have a wife without a fault must remain a bachelor.

When lovers quarrel the only presents not returned are kisses.

The road to ruin is always kept in good repair, and the traveler pays the expenses of it.

He that is good will become better, and he that is bad, worse; for virtue, vice and time, never stop.

Few take care to live well, but many to live long; though it is in everybody's power to do the former.

READING, says Lord Bacon, makes a full man; conversation a ready man; writing an exact man.

Our prayers and God's mercy are like two buckets in a well—when the one ascends, the other descends.

HOSPITALITY.—The Hindus extend their hospitality to their enemies, saying: "The tree does not withdraw its shade even from the woodcutter."

GARMENTS of beauty may cover, but they can never impart worth to abandoned characters.

LOVING hearts are like beggars; they live on what is given them.

He that makes himself an ass, must not take it ill if men ride him.

REFLECT before you act, but, when the time for action arrives, stop thinking.

No snow falls lighter than the snow of age; none heavier, for it never melts.

Don't Cultivate the Mind at the Expense of the Body.

The distinguished Dr. Spurzheim says: "Experience has demonstrated that of any number of children of equal intellectual power, those who receive no particular care in childhood, and who do not learn to read and write until the constitution begins to be consolidated, but who enjoy the benefit of a good physical education, very soon surpass in their studies those who commence earlier, and read numerous books when very young. The mind ought never to be cultivated at the expense of the body; and physical education ought to precede that of the intellect, and then proceed simultaneously with it, without cultivating one faculty to the neglect of others; for health is the base, and instruction the ornament of education."

Beauty an Evidence of Perfection.

Beauty, whether in plants and animals, or in men and women, is the grand external sign of goodness of organization and integrity of function; and the highest possible beauty can indicate nothing less than perfection in these particulars. In the proportion, therefore, that we approach physical perfection, we become beautiful; "the idea of beauty" being, as the learned Dr. Pritchard truly says "synonymous with health, and a perfect organization." Physical goodness (or health) and beauty will always be found to bear a strict relation to each other, the latter being everywhere the sign or symbol of the former. A lack of beauty in any member or system of the body indicates a lack of goodness or health in that member or system. A deformity of limbs shows clearly enough a want of goodness in the locomotive system; a bad complexion not less certainly indicates something wrong in the vital system; and a malformation of the brain, made manifest by the shape of the cranium, is a sure sign of want of balance or symmetry in the mental system.

A GOOD THOUGHT WELL SPOKEN.—No young woman, says a contemporary, ever looks so well to a sensible man as when dressed in plain, neat, modest attire, with but little ornament about her person. She looks then as though she had worth in herself, and needed no artificial rigging to enhance her value. If a young woman would spend as much time improving her mind, training her temper, and cherishing kindness, mercy and other good qualities, as most of them do on extra dress and ornaments to increase their personal charms, she would at least be recognized among a thousand—her character would be read in her countenance.

TRUTHS are at first clouds, then rain, then harvests and food. The philosophy of one century is the common sense of the next. Men are called fools, in one age, for not knowing what they were called fools for averring in the age before. We should so live and labor in our time that what comes to us as seed may go to the next generation as blossom, and that what comes to us as blossom may go to them as fruit. This is what we mean by progress.

(TO BE PUBLISHED SHORTLY.)

'A Synopsis of British Gas Lighting.'

900 pages, large 4-to, profusely illustrated.

This is the only compend of

GAS LIGHTING

ever projected, and will be the standard work of reference among

Companies,
Manufacturers,
Engineers,
Patenters, and
Scientific Men
Generally.

Price \$15.00, Payable on Delivery.

It will be sold only by subscription, which should be addressed to the Compiler,

THE AMERICAN CHEMIST

EDITED BY

CHAS. F. CHANDLER, Ph. D., and W. H. CHANDLER.

TABLE OF CONTENTS

For September and October, 1870.

Articles:—

On the Analine or Coal-Tar Colors. By W. H. Perkin.
London Gas References and the Sulphur Question.
Electro-Deposition of Copper and Brass upon Iron. By W. H. Wadsworth.
Electro-Coating Iron with Copper and Brass. By W. H. Wadsworth.
The various Qualities of Sugar produced in Cuba, and the Different Modes of Manufacture. By Edward Beanes.
Carbon Photographs. By W. H. Chandler.
On some circumstances which favor the simultaneous precipitation of Aluminum and Magnesia by Ammonia. By Laurence F. J. Winkler.

AGENTS WANTED

FOR

Zell's New Encyclopedia.

This work, the Best, the Latest, and the Cheapest ever
published. It is not only a

COMPLETE ENCYCLOPEDIA,
Freshly written, and up with the times, but is also
a thorough and complete

Lexicon, a Gazetteer of the World, a
Biographical, Biblical, Legal
and Medical Dictionary.

And the only book ever published containing all these
subjects, with 2,000 Engravings. This really wonderful
work is to render readily accessible reliable information
on every conceivable subject. No human being could
be found to whom it would not prove invaluable. It
minutely describes every disease flesh is heir to; ex-
plains every legal term or phrase; gives the geography
of the entire world; acquaints you with all noted men
and women living or dead; describes every country, city
and town; defines every word in use in the English lan-
guage; pictures the birth-place and gives portraits of many
distinguished personages; teaches the correct pronun-
ciation of proper names; is a biographical dictionary of
all nations; a biblical dictionary; describes every ani-
mal known to exist; acquaints you with all noted men
and women; warriors, painters, divines, historians,
naturalists, etc., of ancient and modern times; speaks of
all the battles and heroes of the late war; and explores
the whole vast vegetable kingdom.

AGENTS WANTED.—Apply to F. DEWING & CO., 542
California Street, San Francisco, General Agents for the
Pacific States, and Territories. 19v21

Quartz Mills of the Pacific Coast.

Langley's Pacific Directory has hitherto had the reputation of being one of the best authorities for a number of statistics. Its tables of quartz mills, for instance, have been evidently very carefully compiled, and probably give us as correct results as can be obtained. We have gone through these tables in the new volume, and therefrom have compiled the following, which is of considerable statistical value. The number of arastras is not given as complete.

The number of quartz mills in operation in California, January 1st, 1867, was 411, of which 207 were propelled by steam, 186 by water, and 18 by steam and water. The aggregate number of stamps was 4,997, and the cost of machinery was estimated at nearly \$6,000,000. The number, Nov. 1st, 1870, (see following tables) is 421, of which 206 are steam, 198 water, and 17 steam and water. Cost of machinery, \$6,500,000. The number of mills in operation in Montana, in Oct., 1870, was 43, of which 35 are propelled by steam. Aggregate cost of mills and machinery, \$1,100,000. Same for Nevada, 156, of which 125 are steam, 19 water, and 12 steam and water. Estimated cost, \$8,050,000. The following are the condensed tables of quartz mills on the coast.

ARIZONA.	Mills	Stamps	Arastras

SILVER PEAK MINES.—The *Inyo Independent* informs us that J. Ross Browne has been at Silver Peak, examining the mines with a view of interesting English capital. He is represented as expressing favorable opinions as to the property of the Silver Peak Co. He proposes to thoroughly examine the mineral regions of the White Mountains, hereafter.

Bull Run District, Nevada.

[WRITTEN FOR THE PRESS.]

Ens. PRESS:—Everything is progressing satisfactorily here in the different mines which are being worked. There are 10 tunnels now being run to tap various lodes, and 60 men at work who will continue to work all winter. The ores sent to Vance's mill, at Mountain City, for reduction, yielded satisfactorily; some giving as much as \$1,000 per ton. The Johnson Co. are about to start a shaft on their lode. The Sacramento Tunnel Co. are pushing work forward as fast as possible; they are running a tunnel through the main mineral belt of the district, and will cut some 8 or 10 of the leading mines, at a depth of from 50 to 800 feet. Mr. Drew, of Mountain City, is about to remove his 10-stamp mill from that place to here, and will change it to a dry-crusher and add roasting furnaces. He expects to have it running by April next.

The depth of the snow on the mountain is only about three feet. We have had no very cold weather as yet. The amount of ores shipped from this district this summer amounts to 1,723 tons, valued at from \$100 to \$2,000 per ton. If we had had mills here, over 5,000 tons of ores would have been worked during this last summer, of values ranging from \$50 to \$2,000 per ton. According to all appearances, there will be over 20,000 tons of ores taken out of the different mines next year; and if there are facilities for crushing, the bullion shipment will speedily demonstrate the value of the mines in Bull Run.

BULL RUN MINER.

Bull Run, Dec. 19, 1870.

A MONSTER AMALGAMATING PAN.—At the Pacific Co-operative Foundry, Gold Hill, will to-day be completed the largest pan-bottom ever cast in this state. It weighs 8,000 pounds. There is a rim to the pan-bottom, about a foot in height, to which will be added a wooden rim, six feet in height, thus making the pan one of great capacity. The castings for the stirrers and other inside works of the pan, with the bottom, will weigh when complete about nine tons. The pan is to be used in working tailings, and is capable of working 42 tons of tailings per 24 hours. The iron rim which rises above the bottom of the pan to the height of one foot, as noted above, is corrugated internally, in order that the pulp in circling round within the pan may be broken into ripples and whirls and thus kept in that constant state of agitation necessary to the perfect amalgamation of the charge.—*Ter. Enterprise*, Dec. 15.

BORAX.—The Nevada Consolidated Borax Company, which recently incorporated, is going to work in good earnest. Large deposits of crude borax have been found on several lakes and marshes in the State of Nevada, considerable quantities of which have already been received in this city. It is said to yield nearly 35 per cent. of pure borax. Works are being built at North Beach, where the crude article will be rendered fit for market. Foreign borax pays a duty of 10 cents per pound. This Company assert that they can furnish a better article for less money.—*S. F. Bulletin*.

A Great Water Enterprise.

The *Butte Record*, of December 24th, gives the following interesting description of the trial of the pipe described in the illustrated article on our first page: On Monday last, water was turned into the large iron pipe to plunge down a depth of 800 feet, and force its way up the same distance to its point of discharge. It was calculated that it would take four hours to fill the pipe so that it would commence to discharge, and it might cause a much less time to cause a break. How anxiously passed the time, as the lower air-valves, by the approaching water, marked its rise by distances of 100 or 200 feet. Three hours have passed since the water was turned in. Confidence and anxiety are depicted upon the faces of those in charge of the work. The huge rubber ball rises in the last air-valve below the mouth of the pipe, and the next indication of the whereabouts of the water must be at the point of discharge into the canal leading into Cherokee, or a giving away of the huge conduit. Forty minutes pass, the huge iron pipe is not again broken, but from its mouth pours a stream, half filling the cavity of the pipe, takes its way into the ditch, around the graceful curve, and rushes down the side hill into the reservoirs commanding the mines of Cherokee. Men shout with great gladness, and, jumping into the receiver, drink from the mouth of the pipe. Then following the water as it flowed through the ditch, and down the slopes of the hill into the reservoir, proclaim with glad voices that Concow Creek is turned into Cherokee, and the great problem is practically demonstrated. Anvils are fired, and impromptu rejoicings are kept up during Monday until Tuesday, when we visited Cherokee to see with our own eye and hear with our own ears. A friend who accompanied us, declared that every other man in Cherokee had his nose skinned. They can well afford to rejoice. For over twenty years the richest mining section in the Golden State has been dependent upon the winter rains for water for mining purposes. Now they have a living stream that shall cause the placers of that section to yield up their hidden treasures at the touch of its magic wand.

A BIG BLAST.—The Marysville *Appeal* gives the following account of the big blast of 25 tons of powder in the hydraulic claim of the Blue Point Mining Company at Sucker Flat, on the 29th ult: The powder was ignited by means of an electric wire, and the explosion that followed is described by those who witnessed it, as a most magnificent sight. The shock was felt throughout the surrounding country, although the report made was heard but a short distance. The earth is described as having been thrown some thirty feet into the air, while for a space 200 feet in length, 150 in width, and 70 in depth, it was entirely broken up, thus meeting the expectations and sanguine hopes of all interested. * * * During the latter part of the previous week two blasts were made on the claims of the Smartsville Consolidated Mining Company, one of which was not entirely successful. In this latter, some 700 kegs of powder was used, and when ignited, but 100 kegs were exploded. This was sufficient to cover up the rest of the powder so that they were obliged to wash away the earth to get at it. In doing this it was wet, so that out of the remaining 600 kegs but about thirty were recovered in good condition, putting them to a loss of about \$6,500. It was expected that they would make another blast on the 30th of about 700 kegs.

USEFUL TABLES.—Messrs. John Taylor & Co., 512 Washington street, have placed on our desk a pamphlet containing a variety of tables of the values of gold and silver per oz. Troy at different degrees of fineness, assay tables, etc., comprising a valuable work for assayers and others. There are also useful remarks on the properties of gold and of silver; and the whole is very "handy to have in the house." Copies will be mailed free to those who desire it, on application as above. The typographical work is so exceedingly neat, that we cannot refrain from a hearty compliment to the printers, Messrs. Spaulding & Barto, 414 Clay street.

PASSENGERS reach Portland, Oregon, in eight and a half days, by rail and stage, from San Francisco.

RAILROAD INAUGURATION.—We are unable to do more than briefly mention the opening of the S. F. and North Pacific Railroad on last Saturday. This road extends from Donahue, about six miles below Petaluma, on Petaluma Creek, to Santa Rosa, about 22 miles, and has been built by Mr. Peter Donahue, of this city, who has received no assistance except that of county bonds of \$5,000 per mile. Surveys were commenced on August 16th. Mr. R. L. Harris is the Chief Engineer.

THE YALE LOCK.—The ever-increasing expertness of burglars has caused continued improvements in the construction of locks. These are now made of the most complicated construction, yet most of them afford no complete security. We were shown, however, a couple of weeks ago, by Mr. O. V. Gerzabek, Manufacturers' Agent, 563 Market street, a complete assortment of locks which are a great improvement over others known to us. These are the "Yale" locks. The key is no cumbersome article, but light and simple, yet so constructed as to afford an infinite variety of combinations. The serrated edge of the key matches exactly a large number of loose plates in the lock, and unless this correspondence is attained perfectly, the lock cannot be worked. A very slight variation renders the key useless; hence it is almost impossible to pick the lock. The Yale lock is very popular at the East, for use on doors, safes, drawers and the like, and especially in banks, where a perfect device is especially essential. Single and double bank and safe dial locks and prison locks are also to be obtained, the last being a recent invention which has important peculiarities.

ORIGINAL HIDDEN TREASURE.—We learn from good authority that Mr. Clayton, the present able Superintendent of the Hidden Treasure, has sent his resignation to the company. This mine has changed its Superintendents oftener than any mine in this state, which is only attributable to a set of stockjobbers who have control of the mine, and who, it seems, do not wish it to be worked as experience and good sound judgment would dictate, but who are only intent on having good pockets gouged out and worked, and thus run up the stock and manipulate it at their pleasure.—*White Pine News.*

The **SCIENTIFIC PRESS** deserves the support of all Californians, for there is nothing that transpires in connection with Mining, Farming or Mechanics, interesting and useful to the people of this Coast, but finds a place in its columns. As the scientific articles are illustrated, the readers can more readily understand the various subjects which are therein treated. A subscription of \$4 per annum, will ensure it by mail weekly; address Dewey & Co., San Francisco.—*Vallejo Chronicle.*

PHOTOGRAPHY.—For CABINET PHOTOGRAPHS, or Enamelled Cards, of the very best quality, you must go to the **NEW YORK GALLERY**, Nos. 26 and 27 Third street, San Francisco. Every picture warranted to give satisfaction. 0v18 6m B. F. UOWLAND.

BLOCK TIN AND SOLDER WIRE, broom wire, piano covering wire, etc., manufactured by Joshua Gray, 437 Brannan street. 74v19-3m

THOMAS O'NEIL, Ornamental Glass Cutter, No. 10 Stevenson street, up stairs. Stained, Ground and Ornamental Cut Glass to order on reasonable terms. 14v20

MARAVILLA COCOA.—For Breakfast.—The *Globe* says: "Various importers and manufacturers have attempted to attain a reputation for their prepared Cocoas, but we doubt whether any thorough success has been achieved until Messrs. Taylor Brothers discovered the extraordinary qualities of 'Maravilla' Cocoa. Adapting their perfect system of preparation to this finest of all species of the Theobroma they have produced an article which surpasses every other Cocoa in the market. Entire solubility, a delicate aroma, and a rare concentration of the purest elements of nutrition, distinguish the Maravilla Cocoa above all others. For homeopathic and invalids we could not recommend a more agreeable or valuable beverage." Sold in packets only by all Grocers, or whom else may be had Taylor Brothers' Original Homeopathic Cocoa and Soluble Chocolate. St. am Mills—Breck Lane, London. 15v20-y

PATENTS BOUGHT AND SOLD ON COMMISSION.

Longshores Combination Tool.

This device is just what its name indicates. As a KITCHEN Tool, it is indispensable. It will fit and lift with perfect safety, any Stove Lid, Frying Pan, Pie Pan, Pot, Kettle, or any other vessel or dish used about a stove. It is a complete tool for stretching carpets, driving tacks, pulling tacks, &c., &c. It answers the double purpose of hammer and pincers, and is also a good Nut Cracker. It is made of the best malleable iron, and the Hammer, Pincers and tack puller, are all hardened so as to stand the roughest usage. An Agent is wanted in every town on the Pacific Coast to sell this valuable little implement. Retail price fifty cents.

Simonds Patent Collar Stud.

Every one who wears a "Butterfly" tie, knows well the vexation incident to fastening the loop of these ties over the common collar stud or shirt buttons. This stud while serving every purpose of the common article makes this task as easy as hanging ones hat on a nail. The loop slips readily into the slotted bulb, and cannot escape by accident, thus preventing the loss of the tie; now so common. They are well plated with gold. It is very seldom that a patent is offered which affords a larger profit than this one. Parties buying the right to a town, county or state, will be furnished with the studs at what they cost to manufacture. A sample will be sent to any one by mail, on the receipt of the retail price, fifty cents.

Improved Construction of Roofs for Tobacco and Fruit Drying Houses.

Persons who are interested in the drying of fruit or tobacco, can fully appreciate this new and useful invention. The object of the invention is to construct the two inclined sides of the roof of a Tobacco or fruit-drying house, so that the sides can be easily and quickly thrown into a vertical position, so as to expose the fruit or tobacco to the drying effects of the sun and air. By the use of this simple device, the labor and expense of handling the tobacco leaves, and changing them upon the racks, is avoided. In California and Oregon, this invention can be used to great advantage in fruit drying. In time of rain the sides of this roof can be almost instantly lowered to protect the fruit from dampness. This invention has been recently patented by M. de K. Cutts, of Richmond, Va., and a full set of drawings, and Letters Patent, can be seen at our office. Here is an opportunity for a profitable investment, as we are authorized to dispose of Rights at very low prices. Full particulars can be obtained from many of our travelling agents, or by calling at our office.

P. Davis' Wire and Picket Fence.

Although about two hundred different styles of fences have been invented and patented in the United States within the past ten years, yet this Fence, for GENERAL FARM USE, stands at the head of the list. This is because the actual cost of the Fence complete in that State is less than fifty cents per rod. Three men can put up six hundred yards per day. You men who are idle, why hang about the city talking hard times when you can make from five to eight dollars per day building this Fence? We will make a present of ONE FARM RIGHT in each county on the Pacific coast to farmers who will erect one hundred rods of the fence in good style within thirty days after the privilege is granted. We wish to employ several working men to travel in this State and Oregon. Price of territory, and circular with full description of fence sent on application.

New Gas Light.

This Light takes the place of the Candle, the Kerosene Lamp and Coal Gas. Each Lamp is a perfect Gas Factory, making its own gas as fast as it is required. It is a safe, cheap and beautiful light. Circulars and full particulars sent on application. A few good traveling agents wanted to sell this and other valuable Patents.

Hay Press.

The best and cheapest hay press in the United States. Presses furnished at manufactory cost to parties buying County or State Rights. The profits on a few Presses will pay for a county Right.

WIESTER & CO.,
17 New Montgomery Street, (Grand Hotel), San Francisco.

BLAKE'S PATENT STEAM PUMP.

These Pumps have been tested, and found to be indisputably without an equal wherever tried. They are constructed in the most simple style, and built in the most thorough manner—especially calculated for simplicity, durability and power. Some of the advantages of the Blake Pump may be summed up as follows: It is positive under any pressure. May be used in Houses, Factories, Mills, Laundries, and as Boiler Feeders, wherever steam is employed. In fact, wherever water or other liquids are desired to be raised in large or small quantities, or against heavy or light pressure, it is the cheapest and best Pump that can be used. It is offered to the public as the most perfect independent steam Pump ever invented. Forty different sizes are made, capable of throwing from 1000 to 200,000 gallons an hour, and adapted to any class of work that may be required. Every Pump will be warranted to perform the work required of it by the purchaser, or it may be returned and the money will be cheerfully refunded. The Blake Pump was awarded a silver Medal at the last exhibition of Mechanics' Institute, San Francisco, and State Fair at Sacramento, as being the best steam Pump on exhibition. The agents have recently imported several of the largest sized Mining Pumps for water works, and for the purpose of raising water from the mines. It is the most simple and durable, and consequently the best Steam Pump ever built. For sale by HERRY & PLACER, Machinery Depot, 112 and 114 California st., San Francisco, who will be pleased to send circulars to any address, or show its advantages to parties calling on them.

Hand Power
Lever detached.

LIKE "QUAKER GUNS."—Artificial teeth are of little use and easily detected. Take care of the real ones. All you need is fragrant Sozonox. Use it daily, and your teeth will be the last of nature's gifts to fail you.

"SAULDINO'S GLUE," mends headless dolls and broken cradles.

Pain is supposed to be the lot of us poor mortals, as inevitable as death itself and liable at any time to come upon us. Therefore it is important that remedial agents should be at hand to be used as an emergency, when the seminal principle lodged in the system shall develop itself, and we feel excruciating agonies of pain or the depressing influence of disease. Such a remedial agent exists in the PAIN KILLER, whose fame has made the circuit of the globe. Amid the eternalities of the polar regions or beneath the intolerable and burning sun of the tropics, its virtues are known and appreciated. Under all latitudes, from the one extreme to the other, suffering humanity has found relief from many of its ills by its use. The wide and broad area over which this medicine has spread, attests its value and potency. From a small beginning, the Pain Killer has pushed gradually along, making its own highway, solely by its virtues.

Such unexampled success and popularity has brought others into the field, who have attempted, under similarity of name, to usurp the confidence of the people and turn it to their own selfishness and dishonesty, but their efforts have proved fruitless, while the Pain Killer is still growing in public favor.

A NEW PATENT.

If you want a superior set of TEETH on Gold, Rose-Pearl, or Pyroxyline, that will not loosen while masticating, call on DR. BEERS, 109 Montgomery street, opposite the Occidental.

By order of the Board of Trustees. T. F. CRONISE, Secretary. Office, No. 402 Montgomery st., San Francisco.

Washington Mining Company—Location of Works and Mine, Mariposa county, State of California.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the 15th day of December 1870, an assessment of \$3 per share was levied upon the capital stock of said Company, payable immediately in United States gold coin, to the Secretary at the office of the Company, No. 206 Front street, San Francisco.

Any stock upon which assessment shall remain unpaid on the 16th day of January 1871, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday the 6th day of February, 1871, to pay the delinquent assessment, together with costs of advertising and expense of sale. By order of the Board of the Trustees T. B. WINGARD, Secretary. Office, 206, Front street, San Francisco, California.

JOS. THORNHILL,
BRICKLAYER AND CONTRACTOR.
Particular attention paid to all kinds of Fire Work, such as Boilers, Furnaces, Ovens, Grates, Ranges, &c. Orders left with C. W. WHITE, 47 Clay Street, J. THORNHILL, 1612 Mason St., near Green, will be promptly attended to.

Foundry,

Mining

and

Steamships.

REQUIRES

Fifty Per Cent.

LESS POWER

Than any Blower

Now in use.

One of these Blowers may be seen on exhibition at W. T. Garratt's Brass Foundry, corner of Mission and Fremont street. They are also in use at the Almaden Quicksilver Mine; Gridley's Foundry, Gold Hill, Nevada; Aetna Iron Works, San Francisco, and many other places.

CAUTION.—Purchasers will find it to their advantage to apply direct to the Stockton Agency, as certain parties, not authorized to manufacture the Blower, have put in the market machines of inferior construction, which do not answer all the requirements of the genuine article.

Quartz, Saw and Grist Mill Irons, Steam Engines, Horse Powers, High and Low Pressure Steam Engines, Steamboats and Propellers, made at short notice.

SCIENTIFIC PRESS.—This paper comes to us this week with a full double sheet extra. It contains a full map of California, a map of the San Joaquin valley, with a full description and statement of the productions of each county, besides the usual mining, agricultural and scientific intelligence. It is a paper that should be in the hands of every farmer, miner and manufacturer on his coast.—New Transcript.

VICK'S

FLORAL GUIDE

For 1871.

THE FIRST EDITION OF ONE HUNDRED AND FIFTY THOUSAND copies of Vick's Illustrated Catalogue of Seeds and Floral Guide, is published and ready to send out—100 pages, and an Engraving of almost every desirable Flower and Vegetable. It is elegantly printed on fine tinted paper, illustrated with Three Hundred fine Wood Engravings and Two beautiful

COLOR PLATES.

The most beautiful and the most instructive Floral Guide published. A GERMAN EDITION published, in all other respects similar to the English.

Sent free to all my customers of 1870, as rapidly as possible, without application. Sent to all who order them for Ten Cents, which is not half the cost. Address

JAMES VICK,
Rochester, N. Y.

THE

ASPHALTUM PRESSURE PIPE COMPANY,

HAVING ERECTED A MANUFACTORY of sufficient capacity to supply their Asphaltum Pipe in large quantities,

Are now Prepared to Take Orders AND MAKE CONTRACTS.

This Company will manufacture Pipe and guarantee it to stand any pressure required; it is lighter than iron pipe and more durable, it is not affected by chemical action, cannot corrode, and being glazed imparts no disagreeable taste to water. To miners and farmers it is invaluable; any body can put it down; it is twenty per cent cheaper than iron pipe and ten times more durable. For further particulars, apply at the office of the Company, Room No. 2, 645 Market street.
Circulars sent on application. 16v21-4f

TO MINERS, MILLMEN AND METALLURGISTS. Kustel's new work on the Concentration of all kinds of Ores, and the Chlorination Process, for Gold-bearing Sulphurets, Arseniurets, and Gold and Silver Ores generally, is the best and most complete work issued. It contains 120 diagrams, illustrating machinery, etc., which alone are of the greatest value. Price, \$7.50, postage paid. Published by Dewey & Co., publishers of the Scientific Press, San Francisco.

SCIENTIFIC PRESS—three numbers—terms \$4 per annum—San Francisco. Constant improvements are being made in this publication. Illustrated mechanically receive liberal attention. Of late, an edition exclusively devoted to agricultural matters is issued simultaneously with that devoted to mining and scientific affairs generally. The growth of the paper and multiplicity of subjects embraced in the table of contents give evidences of an increased patronage and a corresponding industry to maintain its high character—Colorado Herald.

Miners, Look to Your Interests!**SAVE EXPENSE.**

Use the most economical working machinery for crushing your ores.

The Wilson Patent STEAM STAMP MILL

IS AN
IMMENSE SUCCESS.

NO MINER STUDYING HIS INTERESTS WILL USE ANY OTHER MILL.

It costs a great deal less than any other mill and does its work for from twenty-five to fifty per cent. less expense.

The Wilson Steam Stamp Mill
CRUSHES ONE TON PER HOUR

OF THE
HARDEST QUARTZ,
THROUGH THE ORDINARY SCREENS.

One of these mills now being used as custom mill,

AVERAGED,
On Rock from Twenty-two Mines,
Twenty-eight Tons Per Day.

It uses about three cords of wood for twenty-four hours.

Is all complete when it leaves the shop, and weighs about 6,500 pounds, and can be put in operation in one week after it reaches the mines.

THE COST
of this mill all complete, including boiler, pump, setting and everything in complete running order at the mine is

NOT OVER ONE HALF
THE EQUIVALENT
OF ANY OTHER MILL.

These mills have now been in practical operation for nearly three years, and have proved in point of

Durability, Economy and Efficiency,
TO HAVE
NO EQUAL.

It requires no skill to run them and any one of ordinary abilities can set them up. The success of these mills having been so unprecedented that we now

GUARANTEE THEM
to be all that we claim for them and guarantee all repairs for twelve months.
One of these Mills can be seen at the Pacific Iron Works.

For further particulars address,
FURMAN R. WILSON,
San Francisco.
OR
Wilson Steam Stamp Mill Co.,
326 Walnut street, Phila., Pa.

THE WILSON Patent Steam Stamp Mill.

This extraordinary Mill, now so justly popular in the East, is now offered to the miners of the Pacific Coast. Having been in operation now for about two and a half years, the Company feel confident that the

WILSON STEAM STAMP MILL,
For Durability, Efficiency,
AND ECONOMY OF WORKING,
HAS NO EQUAL.

The Wilson Steam Stamp Mill is the only Steam Mill that has had the severe ordeal of practical working, and proved itself eminently successful. It is now in operation in several of the Eastern States and Territories, and gaining an enviable popularity. The whole machine is so simple as to be readily understood by the most ordinary minds. In fact, its simplicity is its durability. The expense of crushing rock or cement with this Mill is less than one-half the expense of any other Stamp Mill, and less than one-half the cost. For further particulars inquires of

FURMAN R. WILSON,
San Francisco.
Or of THE WILSON STEAM STAMP MILL CO., 326 Walnut Street, Philadelphia, Pa.

NOTICE.—All persons are hereby warned not to manufacture or use any Steam Stamp Mills that are an infringement on the Wilson Patents, as they will be prosecuted to the utmost rigor of the law.
F. R. WILSON,
20v19-1f Supt. W. P. S. S. M. Co., Philadelphia.

STEAM JET PUMP.

Blakelock & Williams' Patent, for Water, Oils, Acids, Etc.

The best cold water pump for filling tanks for stationary or portable Steam Engines. Also highly recommended for MINES, DISTILLERIES, SALT WORKS, STONE QUARRIES, and similar places, and saves the expense of putting up and running an engine.
We call the attention of all proprietors of steam power to the following points of merit:—It is operated by steam taken directly from the Boiler into the Pump; it has no valve or wearing parts of any kind; it requires no belts, pulleys, or machinery of any kind; it operates entirely independent of an engine; it will not choke up with foul water; it costs much less to put up and start; it will not wear out in a lifetime, or require repairs; it is reliable, and certain to work at all times; it is not liable to injury from freezing.
Satisfaction guaranteed or the money refunded.
Send for Circular. PARKER & HUNT,
Southeast cor. Tenth & K Streets, Sacramento City Cal.
AGENTS—CHAS. F. BROCK, 117 California st., San Francisco; KEEF & BARGION, Stockton. 21v21-1f

Varney's Patent Amalgamator.

These Machines Stand Unrivaled.
For rapidity pulverizing and amalgamating ores, they have no equal. No effort has been, or will be spared, to have them constructed in the most perfect manner, and of the great number now in operation, not one has ever required repairs. The constant and increasing demand for them is sufficient evidence of their merits.
They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.

This Amalgamator Operates as Follows.
The pan being filled, the motion of the miller forces the pulp to the center, where it is drawn down through the aperture and between the grinding surfaces. Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly passing a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.
Settlers made on the same principle excel all others. They bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed.
Mill-men are invited to examine these pans and settlers for themselves, at this office, 229 Fremont Street, San Francisco.

Gold Saving Amalgamated Plates.

Miners, Quartz Millmen—Attention.
Best quality of Silver Plated Amalgamated Plates for saving fine particles of gold, furnished at the

SURVEYOR-GENERAL'S REPORT.—The report of the Surveyor-General of California (John W. Bost), from November 1867 to November, 1869, has been received.

SUCCESS IN BUSINESS.—Success in the business world usually depend upon being thoroughly prepared for its duties. Young men! if you would succeed in your business career, secure a good practical business education. This question being settled, the next is where to go. Why, go to the best, of course. Go to **HEALD'S BUSINESS COLLEGE**, located in the new College Building, 24, Post Street, San Francisco. This is the only school upon the Pacific coast where young men can depend upon being thoroughly fitted for Bankers, Merchants, Clerks, and Book-keepers. This school is connected with the "International Business College Association" or Bryant & Stratton chain. Its scholarships are good for tuition in any of the forty colleges, located in all the leading commercial cities of the United States and Canada. There are many interesting features about the school which can not be discussed here. Call at the College and examine its workings. If unable send for circulars and **HEALD'S COLLEGE JOURNAL**, which will be sent free upon application. Address, E. P. HEALD, President, Business College, San Francisco, Cal. 23v22-3ms

Rural and Family Weekly.

This is not only the Largest, Best and Cheapest, but by far the Largest-Circulating Journal of its Class! National in Character, Ably Edited, Superbly Illustrated and Printed, it is the

BEST AMERICAN WEEKLY!

It is the standard authority on all branches of Agriculture, Horticulture, &c. As a Literary and Family paper it is a favorite from Canada to California. Indeed Moore's RURAL has no rival in its sphere, and is the largest illustrated Journal on the continent—each number containing sixteen Five-Column Pages, (double the size of most papers of its class).

A NEW FEATURE.

Among recent accessions to the RURAL's unquested Editorial staff is that of HON. T. HART HYATT, of Cal., as editor of the Pacific Coast Department—a new and valuable feature. By prompt mailing and rapid railroad transit, the RURAL now reaches the Pacific slope about the time of its date.

TERMS, INDUCEMENTS, ETC.

TERMS—\$3 a year of 52 Numbers, and only \$2.50 in clubs of ten. This Quarter's 13 numbers sent FREE, as offered above. Our club inducements for 1871 are unprecedented. Specimens, Premium Lists, &c., sent free to all forming clubs,—and we want a live Club Agent in every town. Address

New Smelting Furnaces — The Piltz Furnace.

[BY GUIDO KESTEL.]

The want of furnaces so constructed as to permit the smelting of larger quantities of ore than hitherto effected with the old styles, led first to the introduction of the "Raschett" system, an arrangement by which the tuyeres, the form of the smelting space being rectangular, are placed in two rows, one of seven or eight on each long side, and are so arranged that the blast of one side strikes between that of the tuyeres of the other side. Fig. 1, which gives a horizontal section of the furnace, explains this. The discharge of metal and slag takes place on the two narrow sides. The smelting result of these furnaces is greatly superior to that of the

by crowbar operations, which usually are frequently necessary in other furnaces on account of clogging up, etc.

Fig. 2 shows a vertical, and Fig. 3 a horizontal section of one of Piltz's furnaces. At *a* is represented a cast-iron box, in which the brick-work, *c*, is placed and the remaining space

ing the metal into the kettle, *e*. Above the crucible are seven tuyeres, *g*. The distance from *g* to the bottom of the hearth is three feet, and from *g* to the feeding-hole, *l*, ten feet. In case eight tuyeres are used, the last one is placed in front at *i*, a few inches higher than the rest, having at the same time a small incli-

RASCHEFFE FURNACE.

old fashioned ones with one or two tuyeres, not only with reference to the larger quantity of ore smelted, in a given time, but also in saving a greater percentage of metal and fuel. The treatment of such a furnace, however, is delicate, and it required many months running before, by gradual improvement, a long smelting campaign was secured.

It is surprising that the rectangular shape was preferred to a circular one, for instance, one like the old iron-assay furnace of Sefstroom, with blast holes at equal distances on the periphery, the very effective result of which was well known. Mr. Anbel gave an elaborate description of Raschett's furnace, alluding in the same to the circular shape. By theoretical reasoning he tried to prove that a circular form does not admit of a uniform smelting-region, and that the consumption of fuel in the center would be a useless one. Notwithstanding this theory, Mr. Piltz, of Freiberg, Saxony, constructed a circular furnace, 5½ feet in diameter in the clear, and with eight tuyeres, which has proved very successful, and which it is now proposed to describe.

For the sake of greater convenience in building, an eight-sided shape was chosen. The first furnace of this kind was built, if I am not mistaken, about four years ago, at Halsbrucke, near Freiberg. From the start, the result was so favorable and so superior to Raschett's that, with slight modifications in regard to dimensions and number of tuyeres, at this time no other furnaces are in use at Freiberg. Anbel's theory did not prove to be correct. In a properly regulated smelting operation, no so-called "pigs" are formed either in the center or elsewhere; the slag runs continually, undisturbed

beaten out with a composition, varying with the nature of the ore, generally being composed of one part of clay or loam and one part (volume) of charcoal, coke or anthracite, all powdered, mixed and moistened slightly. This composition is beaten in as hard as possible by means of wooden or iron pestles, and either the space is entirely filled and the crucible or receiver, *b*, then cut out, or the crucible is shaped during the stamping. The first method is preferable. There are two, sometimes three, tap-holes, lead-

nation, so as to direct the blast to the same point in the center toward which are directed the other seven, which lie in a horizontal position.

The breast, *i*, rests on a hollow cast-iron pipe, cooled by a constant current of water, as are the tuyeres. The upper part of the wall, *k*, is suspended in a cast-iron mantle. The advantage of this arrangement lies in the convenience and facility with which the fire-bricks above the tuyeres, which are mostly exposed to the action

of heat and of dissolving substances, can be removed and replaced without interfering with the upper part. Being suspended, there is also free access to the furnace from all sides. In place of the "hanging suspension," other furnaces of the kind are provided with three or more iron pillars on which the upper masonry rests. The height above the tuyeres differs often greatly up to 20 feet. The section of the furnace widens always toward the feeding-hole, as this has a beneficial effect on the result of smelting. The force of the blast, finding a larger space in the upper region, is diminished as well as the heat, and the ore dust carried out does not amount to more than one per cent. The feeding aperture is at *l*. The gases, etc., enter dust chambers before escaping through the chimney.

One of these furnaces is attended by one smelter, two slag-wheelers and three men to feed. Ore and fuel are regularly charged. The metal is tapped, from 18 to 20 times in 24 hours, into one of the two or three tap-kettles alternately. The slag runs continually into a slag-pot of cast-iron of a pyramidal shape, the base being up. This cone is 29 inches high and 22 inches in diameter on the top. Matt, or globules of metal sink through the yet liquid slag to the bottom, in case any should be carried out. When stiff, the pot is turned over, the end of the slag-cone (where the metal or matt collects) broken off and melted over with the ore.

The blast, or quantity of wind required, is not very great,—for each nozzle, about 125 cubic feet per minute, or for seven tuyeres 875 cubic feet, at a pressure of one inch quicksilver.

In the year 1868, a Piltz-furnace, 20 feet high, smelted in 28 days:

	Tons.
Lead ores.....	545.00
Pyritic ores.....	50.30
Slag and hearth from cupellation, etc.....	220.35
Slag.....	329.25
Magnetic iron ore.....	61.00
Limestone.....	14.00
Total.....	1,219.90

From these were obtained:

	Tons.
Matt.....	224.00
Lead.....	178.26
Silver.....	1.40
Slag.....	646.50

The slag contained 1.56 per cent. of lead and 0.71 oz. of silver per ton. The above 1,219 tons of smelting material (which are put into the furnace mixed together) consumed 109.8 tons of coke (middling quality), or 9 per cent., while the old Freiberg double-furnaces consumed 14 per cent., and other furnaces 20 per cent. and over.

A LOSS TO THE COAST.—It is now stated authoritatively that Bret Harte is to take up his abode permanently at the East. We can believe that the change may be advantageous to him, in most respects, but to us it will be a grievous loss. He has acquired and maintained here a reputation which is enjoyed but by few literary men, and has thereby raised the Coast in the estimation of the world. We owe very much to him, and it seems a pity that we cannot make it to his advantage to remain with us. Wherever he may be, however, he will have the hearty good wishes of our California public.

ANOTHER STRIKE is reported in the Pennsylvania coal mines; 10,000 men thrown out of employment.

MECHANICAL PROGRESS.

HEAT RADIATION AS AFFECTED BY SURFACE.—In one of his last papers, Prof. Magnus gives experiments made with platinum plates instead of plates easily oxidizable, in order to avoid possible error. He found that "when surface is otherwise the same, inequalities may exist without any increase in the radiation. When, on the contrary, a plain platinum plate which had been heated by a glass-blower's lamp and was quite soft, was roughened by means of fine emery paper the radiation was doubled. When a platinum plate was covered with a thin plate of spongy platinum, by spreading a thin layer of ammonio-chloride of platinum upon it, and then strongly heating; without treatment with nitric acid, it indicated seven times as much radiation as before being treated with spongy platinum. The author concludes that the increase of radiation with a roughened surface depends essentially on the refraction which heat experiences on its emergence from the surface of a radiating body. The greater the refractive index of heat between the radiating substance and the air, the smaller is the radiation from the plane surface, and the quantity of heat reflected inward increases. The metals have doubtless a very high refracting index. Hence they reflect the rays from without and allow but few to penetrate, and hence they reflect internally those coming from the interior, and allow but few to emerge. Great inequalities of radiating surface do not occasion any important alteration in the radiation. Such a one only occurs when the radii of curvature are very small and change greatly, and when the radiating surface has but little diathermancy. In general, the roughness of the surface may effect both an increase and a diminution in the radiation; but if the inequalities are very fine and very deep, there is almost an increase in substances like metals. When there is a very fine powder of the same substance on almost any radiating surface, the radiation is considerably increased."

NEW ARTILLERY.—The "situation" at the present war center has stimulated invention in this direction. The following notes are from the London *Pall Mall Gazette*:—Cail, the noted Parisian mechanical engineer, has produced an armored locomotive, furnished with two powerful mitrailleurs, also protected by armor, originally intended for the railway bridge at Point du Jour, whence it was to throw bullets on to the heights of Moudin. This machine, weighs altogether some six tons. Among other New French inventions are the Marekderberg mitrailleur, throwing 250 balls a minute, and the Montigny, throwing 480, as well as the Durant steam mitrailleur, which discharges no less than 4,500 bullets per minute, and the Faucheur, or "mower" which is said to have a range of 500 to 600 yards, and to cost only 35 francs. In addition to the above, many novel shells have been proposed; among which are the Gaudin fire-bomb, the improved Meustrol shell, bombs emitting suffocating vapors, and others. On the part of the Prussians, Herr Krupp has invented a gun for shooting balloons. This has a carriage and wheels like any other field gun, and can be served by a single man with ease, as it weighs only about 150 pounds. It can be aimed in any direction, horizontal or vertical. The charge consists of a grenade weighing about three pounds, the object of which is to make the balloon explode on its bursting. It is affirmed that a balloon can be struck at a height of 2,000 feet, and that the horizontal range of the gun is five miles. Herr Krupp intends to present 20 of these field pieces to the army, one of which has been already forwarded, and six are about to follow.

RUBBER TIRES WILL NOT PAY.—The following is the closing paragraph of an editorial in the London *Engineering* of Dec. 9th:

"An ordinary eight-horse traction engine costs, say, from 360*l.* to 380*l.*, while an engine rated at the same power, fitted with india-rubber tyres, costs about 600*l.*, and the thing yet to be proved is whether india-rubber is the best investment for this extra 220*l.* or 240*l.*, or whether it could not be more advantageously spent in securing durability in other ways. So many traction engines with india-rubber tyres have now been built and set to work in various parts of the world that it can scarcely be long before data are available which will enable us to estimate such tyres at their

true commercial value; meanwhile we reiterate our opinion that this value will be found less than now appears to be generally supposed. That there are certain special circumstances that may warrant the employment of india-rubber tyres we admit; but that for general purposes they are worth the money they cost, we cannot at present believe."

MOBILITY OF COPPER IN SILVER ALLOY.

—The following is from an editorial in *Engineering* for Dec. 9th on "The manufacture of money":—"In his report, Mr. Roberts refers to certain valuable experiments carried out by M. Levol of the Paris mint to determine the laws which regulate the remarkable mobility of copper in a silver alloy, whereby the homogeneity of the mixture is destroyed, and the proportion of silver and copper varied throughout the mass. Levol found that only one alloy could be found in which copper and silver could be mixed without this movement of particles taking place. This alloy contained 71.893 of silver and 28.107 of copper; but if this proportion was altered, the copper appeared in undue quantity either on the inside or the outside of the cast bar, according as the alloy was richer or poorer. Thus in a cast tube, measuring 42 millimetres on a side, and formed of 77.33 of silver and 22.67 of copper, the centre of the tube had a richness of 78.318 per cent., the outside only 71.015 per cent. while results the reverse of this were observed in alloys poorer than the standard of 71.893 per cent. of silver."

THE LITTLE SYSTEM OF TELEGRAPHY.

—D. H. Craig writes the *Scientific American*, Jan. 1st, that this system is about to be placed before the public of Washington and New York for the transaction of business. He says it is destined to effect a complete revolution in the whole telegraph and postal business of the country; and that there would seem to be no reason why the public should not have 20-word messages telegraphed from one end of the country to the other for ten cents each, provided they will furnish enough of such messages to keep the wires employed. We quote:—"With our system we can work just as rapidly and as correctly over the poorest iron Morse wire, as over the best steel and copper compound wire, in any length of circuit where it is possible to deliver a steady flow of even one-twentieth part of the necessary current to work a Morse machine or a Hughes-Pelphs printer; but of course a compound wire, such as we use on the Washington line, though it adds nothing to the average cost of lines, considering the less number of posts and insulators that are required, really adds nearly three times to the conducting power and tensile strength as compared with the iron wire in general use by the Morse lines. While, therefore, our wire would enable us to telegraph over a circuit two or three times greater than we could do with a common iron Morse wire, the latter would answer our purpose precisely as well as the former in any length of circuit where the iron wire could deliver a steady flow (however slight) of current. Mr. Prescott and other parties who have striven so vigorously to write down automatic telegraphy, have ignored the important fact that Mr. Little uses electricity under entirely different conditions from what it was ever before used by any person who has experimented in fast telegraphy; and it is to this fact, and not at all to the fact that we have a superior line, that we transmit and record correctly 1,000 words per minute, or 60,000 words per hour, over a single wire, equal to the average speed of 100 wires by the Morse system."

THE MCCrackEN GAS PROCESS.—The *N. Y. Gas Light Journal* has seen the working of this process at New Britain, Conn., and reports favorably. We quote:—"The apparatus is simple, and its application requires but little expense, inasmuch as it requires no change in the ordinary settings of the benches. The tar is evidently completely utilized and converted into illuminating gas as fast as it is formed, largely increasing the volume and illuminating power of the gas. The most casual observer cannot fail to notice the high candle power of the gas, and especially the peculiar whiteness of the flame, evidently owing to the excess of olefant gas and possibly acetylene, which it derives from the decomposition of the tar in combination with the superheated steam. We italicise the latter part of the sentence, because it is the great secret of the success of Mr. E. D. McCracken's process—the key to the enigma which all prior experimenters have sought for in vain."

SCIENTIFIC PROGRESS.

DEEP SEA MUD.—Following are some paragraphs from an article in a late number of *Nature*:—"Dr. C. W. Gumbel has recently published an important paper, containing an account of some highly interesting investigations on deep-sea mud. Sir R. Murchison and Professor Huxley provided him with a large quantity of mud, taken up from the Atlantic at lat 29° 36' 54" N., and long 18° 19' 48" W., at a depth of about 2,350 fathoms. This he first cleared, by long-continued washing, from all sea-salts soluble in water; then he divided it, by filtering, into three parts. In the first, Foraminifera and larger organisms predominated; the second consisted of a sediment easily distinguished from the first, fine but heavy; the third was fine and flaky, remaining lightly suspended in water, and consisting almost exclusively of *Bathybius*, *Coccoliths*, *Coccospheres*, together with other organisms of the smallest kind (*Diatoms*, *Radiolaria*, *Spongespicules*, and a very few of the smallest Foraminifera). * * * "The third portion of the deep-sea mud is worthy in a high degree of the interest both of the zoologist and the geologist, whilst it gives scope for many far-reaching theories. If we first analyse it microscopically, the substance, which resembles a white clay mud, resolves itself, apart from the intermingled minutest *Globigerina* and some few other Foraminifera, into a heap of little granules, the so-called *Coccoliths* (*Discoliths* and *Cyatholiths*), and of granulous flaky little lumps, the so-called *Bathybius*, compared with which all other ingredients,—the siliceous-shelled *Diatoms*, and *Radiolaria*, and also perhaps the so-called *Coccospheres* and other small organic bodies excepted,—are of very secondary importance. The part of the deep-sea mud which is made up of *Diatoms* and *Radiolaria*, together with *Spongespicules*, is of especial importance, because it consists to no inconsiderable extent of silica, and appears to be the source from which the siliceous concretions in many chalk formations have drawn their materials. That these form no inconsiderable part of the composition of deep-sea mud may be clearly seen by removing the chalk by means of acids, and the organic matter by heat or by sulphuric acid. * * * Speaking of the *Coccoliths* and the *Bathybius*, Dr. Gumbel says he is in a position to confirm the conclusions of Profs. Huxley, Carpenter, and Haeckel with respect to their organic nature. * * * After detailing some observations, microscopic and chemical, on *Bathybius* and *Coccoliths*, Dr. Gumbel proceeds to speak of the further distribution of the latter. "First," he says, "on looking through the algae, hydroids, polyps, corals, etc., which occur on shallow sea coasts, such as may easily be met with in every botanical and zoological collection, I succeeded in numerous instances in finding *Coccoliths* in the places where they had grown, and not seldom, *Bathybius* at the same time. These investigations were extended to points on the coasts of almost all seas, and now, instead of the statement lately made that the organisms in question thrive only at a depth of 5,000 feet, I am in a position to assert on a proved fact, that *Coccoliths* (*Bathybius*) occur in all seas and at all depths. By their astonishingly wide distribution and their vast numbers, which stamp them as one of the most essential members of rock-forming substances, they gain infinitely in scientific interest."

FRENCH SCIENTISTS STILL ACTIVE.—M. Janssen, the celebrated astronomer, was to join the Eclipse Expedition, leaving Paris in a balloon constructed for his private use at the expense of the French Government, which did not lose a single day, after coming into power, in commencing the preparations. M. Janssen will carry a telescope constructed in eight weeks by Parisian workmen. The French Academy has held its sittings regularly since the commencement of the siege, and the *Comptes Rendus* has been published every week.

RETURN OF THE AMAZON EXPEDITION.—Prof. Fred. C. Hartt and party arrived in New York Dec. 21st from the Valley of the Amazon, which they have been exploring for the six months past. They bring a large collection of geological specimens and fossils, designed for Cornell University. They report further evidence in refutation of the glacial theory of Prof. Agassiz as regards that region.

THE BOSTON MUSEUM.—The *Boston Post* says:—"Since the acquisition of the private collection of Prof. Agassiz, the Boston Museum may claim rank among the foremost institutions of its kind; for although the British Museum in London and the Jardin des Plantes in Paris are on a very much larger scale, yet in certain departments, such as corals and fishes, the Museum of Comparative Zoology is superior to both, while the increase of its collections since its existence, and the prominence it has attained among other museums, are such as no like establishment has reached in the same time and with the same means. In the new building now going up, which adjoins the present Museum and is to be of equal dimensions, it is intended to exhibit all the animals peculiar to the different parts of the world, in such a manner as to impress the observer with their natural association in nature, so that the student shall be able to make himself familiar in one part of the building with the latest result of scientific research in working out the system which binds together the whole animal kingdom as a unit; while in the other part of the building their geographical distribution upon the whole surface of the earth, and their various combinations and associations on different continents will be made apparent. Such a twofold arrangement of collections has never yet been attempted in any museum, not even in the largest and most prominent institutions of the kind in Europe. The fossil remains of past ages will be exhibited in like manner in such an arrangement as to display at the same time their order of succession in geological periods, and their relations to the animals now living. It is intended to complete this plan by exhibiting also the different stages of all known animals, from their earliest period of development in the egg to their adult condition. This is a truly magnificent plan."

HEREDITARY DEFORMITIES.—*Nature* calls attention to Brown-Séquard's experiments on epileptic guinea pigs detailed at the recent meeting of the British Association. Dr. Brown-Séquard produced epileptic fits in the guinea pigs, either by the section of one-half of the spinal cord, or by the division of the sciatic nerve on one or both sides. During the fits it sometimes happens that the hind foot gets between the teeth and is bitten. The animal, on recovery from the fit, tastes the blood, and if it be one in which the sciatic nerve has been divided, proceeds to nibble off the two outer toes, which have entirely lost their sensibility from the operation on the nerve. In breeding from pairs of this kind, the offspring is without the two toes of which the parents have deprived themselves; and in these cases all the offspring become, as they grow up, perfectly epileptic; while in ordinary cases epilepsy is only rarely transmitted hereditarily. Other peculiarities existing in these epileptic guinea pigs were also found to be transmitted to their offspring; and in dissection of the hereditarily malformed animals, a node was found on the sciatic nerve corresponding to that formed after section of the nerve in the parent.

HAECKEL'S NATURAL HISTORY OF CREATION.—We quote the following paragraph from a notice, in *Nature* for Dec. 8th, of the second edition of this work, just issued:—"The remainder of the volume, nearly half, is taken up with a concrete history of creation, i.e. with an account of how, and by what steps, all kinds of plants and animals have grown out of the primordial moners, those first existing living things which were, according to Haeckel, neither plants nor animals, but belonged to a third kingdom of Protists. This part of the work therefore is a descriptive genealogy of all living beings, the pedigree of each kind of creature being made out, or rather conjectured out, as far as present knowledge will allow. In the second edition, as might have been anticipated, the genealogies are very much extended, and given with much greater detail than at first; in particular, there is a new whole chapter on the migration and dispersion of mankind, and on the species and races of men. The results of phylogenetic speculation or inquiry are graphically shown in elaborate genealogical trees; and a new, large plate shows at one glance how all races of men have probably spread from a hypothetical paradise once situate in the great continent of Lemuria, now sunk below the waves of the Indian Ocean."

CORRESPONDENCE.

Bound East.

(WRITTEN FOR THE PRESS.)

Once more I resume my travels, this time with my face turned steadily eastward. Over the Western Pacific to Sacramento, over the Central Pacific to Ogden, I traverse again the regions which I have already described at length in previous letters, and on which I therefore dwell no further in this communication. I received, as ever, the best treatment from the Railroad Company, which rendered the trip one of pleasure.

Ogden to Omaha.

From Ogden I pass over, to me, new ground, and am made the recipient of the hospitality of a new company. I find, however, no diminution in the comfort of the accommodations or the attentiveness of the employees. I have made the acquaintance of several of the officers of the road. I may be permitted to mention the names of the efficient Land Commissioner, Mr. O. F. Davis, and of the Chief Engineer and Superintendent, General T. E. Sickles. Gen. Sickles has succeeded Col. Hammond. He is a genial, pleasant gentleman and an excellent engineer of great experience. Under his management the interests of neither road nor traveler will suffer.

Leaving Ogden we go through the Wahsatch mountains, between them, if you please. The Weber has cut us a passage, and a grand one, in the red sandstone harrier, often exceedingly narrow, but at the same time exceedingly beautiful. The Devil's Gate here has an extensive fame, although the old gentleman is not generally supposed to have a residence near running water. Echo Cañon greets us with its fine scenery, and we then roll on through Wyoming Territory. Allow me here to suggest that you get and publish a map of the railroad for the benefit of your readers.

Immediately on entering Wyoming, we pass Evanston, known to you through its coal deposits, which are said to be of excellent quality. We go by the romantic Church Buttes, pass Fort Steele, and finally get to Laramie, with its curious rocks of red sandstone. At Separation and Carbon we see coal-pits. The deposit at Carbon is nine feet thick, is said to contain good coal, which is, however, very soft, and crumbles easily on exposure. It retains fire long, as shown by the cinders at night. [Our correspondent passed Carbon previous to the occurrence of the fire there. Eds. Press.]

We pass along the line of the Black Hills, where sportsmen delight to stay, I am told, and come to Cheyenne. Here is the branch road south to Denver. By the way, I forgot to notice Sherman, the highest point on the road, 8,250 feet above the sea, passed before we reached Cheyenne. I really was not aware of the important fact as I rode along, until it was too late to appreciate it.

Between Pine Bluffs and Bushnell, we cross the boundary line of Wyoming and come into Nebraska. On a gradual descent we ride on, by Julesburg, of former fame, once rejoicing in the title of "Hell on Wheels," down to the valley of the Platte, crossing the North Branch, near its junction with the South, where it is 2,100 feet wide and two to six feet deep. Then we follow the river, until we finally reach Omaha.

The Union Pacific.

I have given the above few statements of the places passed on the way. I will now give a few facts about the road, condensing as much as possible. The road is subdivided into four divisions, each with its Division Superintendent: the Utah, from Ogden to Bryan; the Laramie, from Bryan to Laramie; the Lodge Pole, from Laramie to North Platte City; and the Platte, from North Platte to Omaha. I met Mr. L. Fillmore, who is Div. Supt. of the Laramie Division, which will include also the Utah Division after June, 1871; and Mr. S. H. H. Clark, Div. Supt. of the Platte Division, which will include the Lodge Pole Division. The gentleman named have shown themselves so capable that they will retain charge of their enlarged divisions. The road has now in use 150 locomotives 41 passenger cars, Pullman palace cars on every train, 22 emigrant cars, 15 mail and express, 42 caboose, 13 baggage, 2,069 box, 1,629 flat, 342 coal, 12 fruit, 48 stock, and various other cars. It is firm and well built. The rails are fishbed, and the ties number 2,650 to the mile.

The government grant of lands for the lines from Omaha to Sacramento amounts to 22,720,000 acres, divided as follows: Union Pacific, 13,207,600; Central Pacific, 9,512,400. These figures are calculated for the junction at Promontory. The change to Ogden will make a difference. The subsidies are as follows: Union Pacific, 526 miles at \$16,000 per mile; 408 at \$32,000;

the Sacramento and San Joaquin Rivers, are naturally of a very porous nature, and, until consolidated by draining and settling, may not inaptly be likened to huge pieces of sponge, the edges of which are covered by a coating of clayey sediment, very nearly impervious to water. Upon the upper ends of some of these islands, sediment has accumulated to such an extent as to form quite a firm soil for several rods inland; while upon the lower ends, in many instances, it is simply a thin layer, extending but a few yards from the shore. Where this sediment is of sufficient depth to reach some feet below the bottom of the ditch or excavation, made in constructing levees, and is of sufficient consistency at this depth to keep out water, the levees may, if desirable, be located inside of the ditch; but upon the lower ends of these islands, where this coating is not more than three or four feet in thickness, the ditch should be on the inside; otherwise, cutting through this impervious layer, it would admit water to the edges of the "sponge," and the land inside would remain so saturated as greatly to impede, if not wholly prevent, cultivation, until sediment is deposited in the ditch in sufficient quantities to stop the water, which in many cases would not be for years.

the sales up to date (Dec. 16th, 1870) are 287,204 acres, amounting to \$1,280,190.35. At the same time, the intervening sections of rich Government lands on the line of the railroad are rapidly settling. Thousands have availed themselves of the fine opportunities thus presented to men of limited means. An additional amount of 280,000 acres, located in Washington, Dodge, Colfax, Saunders, Butler and Polk counties, Nebraska, has been placed in market by the company, better facilities offered to settlers, and the terms of payment made still more favorable. A branch road is built and running from Fremont across Dodge county, bridges across the Platte have been built, and other improvements are continually made. The Government lands are surveyed and open to entry by actual settlers, across the entire State of Nebraska, and will be surveyed and opened this season through Wyoming, Colorado and Utah. The Land Department receives daily 100 to 200 letters of inquiry, and the prospects of a large immigration this next year are very flattering. W. H. M.

Important to Tide Land Owners.

EDITOR PRESS:—Some, perhaps all, of the tide land islands, lying near the mouth of

upon enlarging the levee, the dirt was taken from the outside, letting in the water, and greatly injuring, if not entirely destroying the crop. He told me that the result of this experiment was such that the Trustees of the district would allow no more such work to be done. I make this statement, partly because the parties who consulted me contemplate disregarding my advice; but more particularly for the purpose of recommending those less headstrong and conceited to examine well the character of their lands before making their ditches on the outside. A. B. BOWERS, C.E.

Granular Fuel.

EDITORS PRESS:—In any country in which firewood is worth from seven to ten dollars a cord, it is an object worthy the consideration of every land owner, to avail himself of every means to turn to the best account every particle of wood growth, the product of his lands, that can be converted into a marketable article of fuel, at a value greater than the cost of production.

Is it generally known and understood that the now almost useless brush-wood and willows of large tracts of lands bordering the rivers and sloughs of our valleys, can be converted into a compact, valuable fuel for light fires, or for igniting themore solid materials employed in heavy ones either of wood or coal?

The preparation of such a fuel as this, consists in subjecting the willows or other brush-wood to the action of a machine similar in construction to an ordinary straw cutter, but of greater strength, by which it is cut into lengths equal to about twice the diameter of the brush-wood used. It is put upon the market, of different sizes, numbered one, two and three, depending upon the general diameter of the brush; and to effect this, the brush is sorted into three sizes before passing to the cutters.

It is sold by the bushel, and as the brush is always cut when free from leaves, the product is cleanly, and when dry, highly inflammable. The coarser grade, the most of which is an inch in diameter, is an excellent fuel alone, for small apartments or where only a light quick fire is desired to simply take off the chill from larger apartments, in which a more solid or lasting fire would be objectionable.

It is also useful in cooking, in a small way, or where it is desired to build a fire in a furnace or other close, compact place. The finer grades are used for quick kindling.

Alders and willows are the best woods, and most in vogue where the granular fuel is used, because easily cut, and are woods that contain a large amount of pure carbon, being the woods generally used for powder making. But the brush of any wood or timber can be used with large profit to the producer, and economy and comfort to the consumer. Even the stacks of broomcorn are sometimes used for granular fuel.

In many of the large cities of Europe, and particularly in the warmer latitudes, this kind of fuel is in such common use as to be deemed indispensable.

Granular fuel, though cut green, dries quickly, from the facility with which the air enters the pores of the short section, and is ready for use in a few days after being cut. This fuel once introduced into our large cities would never after be dispensed with.

Who will be the first to put this really excellent and useful fuel on our markets? The cost of the uncut, raw material would be but trifling, and alders and willow will renew their growth to a proper size, the third year from the last cutting. W. W.

150 at \$48,000; total, \$28,672,000; Central Pacific, 12 at \$16,000; 522 at \$32,000; 156 at \$48,000; total, \$24,384,000. Government also guaranteed the interest on the companies' first mortgage bonds to an equal amount.

The first contract for construction on the Union Pacific was made in August, 1864, but there were many obstacles at first. By January, 1866, 40 miles had been built. During 1866, 265 miles additional, and in 1867, 285 miles were completed. Then the work was pushed much faster, and on May 30th, 1869, the road met the Central Pacific at Promontory, the last 534 miles having been built in a little over 15 months, or at the average rate of nearly one and one-fifth miles daily.

I could give you many more statistics, did I not fear to take up too much space. But I must content myself with these few facts, which may prove of interest to your readers, although not new for the most part.

Railroad Lands.

In many places there is an abundance of good land, which is rendered available by the railroad, and the Union Pacific Company has under consideration plans for the irrigation of districts which only need water, as has been proved, to be rendered most productive. The company seems to be actuated by the soundest principles of economy in this respect, and to be doing excellent work. Their lands are located in Nebraska, Wyoming, Colorado and Utah, and the crops raised are most varied and large. A few statements on this subject may be in place here.

The office of the Land Department was opened for business, and the sales of the land commenced, July, 28th, 1869. During the first year, the sales were restricted to a tract included within the ten-mile limits on the first 200 miles of the grant. The lands offered have been eagerly taken by settlers,

MINING SUMMARY.

The following information is gleaned mostly from journals published in the interior, in close proximity to the mines mentioned.

California.

ALPINE COUNTY.

SCHENECTADY.—*Miner*, Dec. 31st: Good ore is being taken out from several drifts, and the prospect for plenty of work for a mill is cheering.

MR. BULLION.—The rock in this tunnel continues to work favorably, fifteen feet a week having been added for the past month.

MONITOR—SILVER GLANCE.—Encouraging symptoms in these; and with fair rock both drifts will reach points where something better than ever is expected, within a few weeks.

GLOBE.—On Monday work will be commenced on the new Esmeralda purchase of the Globe. A drift will be run upon the 320-foot vein found in the old tunnel. This vein at the point cut carries ore assaying \$15 to \$25 per ton, and when it is remembered that this claim is the same from which \$3,000 ore was taken near the creek in 1862, great things may be expected from this movement. This drift will intersect the course of the East drift from the main tunnel, and a winze will connect the two. The Mill is progressing finely.

CALAVERAS COUNTY.

RICH QUARTZ.—*Chronicle*, Jan. 7th: One of the richest ledges ever discovered in this county has recently been found by Mr. Andrew Sanderson, of Railroad Flat, near the Calaveras river, a mile and a half from Railroad. But very little work has yet been done, the sinking of a shaft twenty-two feet in depth comprising all, so far. Nine tons of rock were obtained from the shaft, hauled to Randolph's mill in Railroad, and crushed. On Monday last, Mr. Sanderson showed us the proceeds—a "chunk" of gold weighing 56½ ounces, an average of \$107 per ton. He has christened it the "Champion" lead.

WHISKY SLIDE MINE.—We learn that work is progressing rapidly on the mine. Hardigan & Co., the proprietors, are "pushing things." Their tunnel is in two hundred feet, leaving seventy-five yet to run. The mine will be in shape for thorough prospecting by spring.

RICH.—We have been shown some specimens of quartz from the bottom of the shaft at the Palomo mine, Lower Rich Gulch, that are certainly promising. Free gold is visible all over them, and the rock contains a large quantity of sulphurets that assay \$2,000 per ton. The specimens were from the depth of four hundred feet. At that point the vein is 8 feet in width. The batteries are being crowded to their utmost capacity, and the mine is paying well.

INYO COUNTY.

IGNACIO MINE.—*Independent*, Jan. 2d: By the failure of Mrs. Woodworth to pay the liabilities, the whole of the Woodworth interest becomes the property of Davison, the redemption creditor. Mr. Davison asks \$10,000 for his interest.

CERRO GORDO.—Cor. of same: Hart & Whipple, White & Williams, and Mr. E. A. Reddy are the only parties that are taking out any galena of note. On the Belmont side the tunnels are being prosecuted with vigor. The Crowning Glory has changed hands. The Oceola and Friendship are being worked. The Wittekind miners have their tunnel in one hundred and eighty feet, but have struck very hard rock, being unable to make more than five inches on each shift of ten hours. The Belmont miners have passed the point with their tunnel at which they expected to strike their ledge, but have failed to see it as yet. Harrington & Burns are still going ahead on the Sunburst, having a shaft sixty-eight feet deep, and a drift of nearly the same; they are taking out rich ore, and have on the dump enough to nearly pay all the expenses.

LASSEN COUNTY.

BIO VALLEY.—The Susanville *Sage Brush* says that Hayden Hill will soon prove one of the richest districts east of the Sierra. The Providence Co. have taken out several thousands of dollars worth of dust, merely by washing out the earth or dirt from their ledge, but it is impossible to save any considerable portion. Arastras will, however, soon be in operation.

MARIPOSA COUNTY.

SHUT DOWN.—*Gazette*, Jan. 6th: Operations at the mine and mill of the Mariposa Estate were suspended on Monday last by order of the Manager, and the hands were discharged. The results of the operations have not been satisfactory of late, in consequence, it is alleged, of mismanagement in the works. The pump will be kept

going, we are informed, and the mine kept in condition to resume work.

NEVADA COUNTY.

QUARTZ.—*Gazette*, Jan. 4th: The lack of rain for hydraulic mining has stimulated quartz prospecting. The Kistle ledge, three miles east of town, is being worked, after having been idle for some time, and is yielding excellent rock. The owners of the Wyoming ledge, on Wood's ravine, are having 100 tons of rock crushed at Sogg's mill. Good judges say the rock will yield \$50 a ton. The owners of the Orleans ledge, on Gold Flat, are having 100 tons of rock crushed as a test, at the Sebastopol mill.

THE PROSPECT.—*Transcript*, Jan. 5th: The gold yield, especially from gravel mines, will be largely increased this season. Gentry & Co., on Oustonah Hill, will complete their three years' tunnel work in time to commence washing in the spring. Rolfe & Co., on Cement Hill, are fitting up for hydraulicing. Considerable foreign capital has been invested in Bridgeport township. In Bloomfield, the Gravel Co. are working 11 men and taking out \$250 per day, while opening their claim. In Eureka new claims have been opened. In Rough and Ready Township, the discoveries at Randolph Flat by Webster & Co., McSorley & Co. and the Picayune Co., have given impetus to mining, and a number of claims will be opened. In Little York township, You Bet, Lowell Hill, Chalk Bluff, and Quaker Hill only need water to commence washing.

TO BE STARTED UP.—Same of 7th: We understand that the Nevada Quartz mine, formerly known as the Sogg's mine, is to be worked again. The San Francisco Co. have appointed a superintendent here, and work is to be commenced in 60 days.

A TUNNEL.—Same of 8th: The North Bloomfield Co. will commence very soon to run a tunnel from Humburg Creek to the gravel channel they are now prospecting. A force of 60 men will be put on, and the tunnel, which will be a mile long, put through as rapidly as possible. This Co. have gravel deposits 208 feet deep which prospect from the surface.

LITTLE YORK.—*Grass Valley Union*, Jan. 4th: Only one set of hydraulic claims is being worked, because of want of water. The mines are open, the pipes ready, and the miners are prepared.

MILLS IN NEVADA COUNTY.—Same of 5th: There are 60, containing in all 480 stamps. During 1870, 250,000 tons of quartz were milled. Part of these mills are for cement. In '69, Bridgeport township milled 30,000 tons of cement, and the figures for this year are considerably higher.

PLACER COUNTY.

WATER.—*Stars and Stripes*, Jan. 5th: The dust now flies where generally at this season of the year there is mud. Even the supply of water for quartz and cement mills is wanting, and ore accumulates on the dumps.

REDUCTION WORKS.—*Herald*, Jan. 7th: W. G. Green & Co. are erecting reduction works at their mine, two miles west of here, and will have them started by the time there is water to run them.

PLUMAS COUNTY.

RICH ROCK.—*Quincy National*, Jan. 7th: It is reported that very rich rock was discovered in the quartz claim of Hamill & Malloy, at Argentine last week.

NEARLY READY.—The machinery for the new mill at Argentine, owned by Ray & Concklin is being put in place.

EUREKA MINE.—*Grass Valley Union*, Jan. 11th: The run of the mill for 9¼ days, including last Saturday, resulted in a yield of \$23,000 worth of gold. That amount and \$8,000 worth from sulphurets, in all \$31,000, made the Eureka's shipment.

NORTH STAR.—The Company, last Monday, declared a dividend of \$4 per share on the stock. The last month's run of the mine was something above \$20,000, and everything underground promising.

SIERRA COUNTY.

THE KEYSTONE.—*Democrat*, Jan. 5th: The night hands on Friday drove a drill through from the lower tunnel to the one run from the shaft on the same level, thereby tapping 120 feet of water that was in the shaft. So accurately was the survey made by Ike Jones, that they did not experience the least difficulty. The men came out of the shaft in the car, 1,400 feet, by the time the water got out.

TAPPED.—*Messenger*, Dec. 7th: The Highland and Masonic Co., tapped the old shaft in their claim a few days since, without accident. There was three hundred feet of water in it, besides what was in the old stopes and tunnels. It took three days for the water to run out.

THIS WEEK.—The new mill at the Reis mine will be completed this week.

PUMP.—The owners of the Monte Cristo

claims at Port Wine have bought a new engine and pump for their works.

TRINITY COUNTY.

A PROSPECT.—*Journal*, Dec. 7th: Frank Dolliff, Orrin Treat and A. Canada have struck a back channel in Pike County Bar, four miles below Douglas City. They have a prospect of three bits to the pan, eight feet from the bed-rock.

Nevada.

COPE DISTRICT.

The Owyhee *Avalanche* of Dec. 31st gets these items from a late arrival: The Kanawa is one of the richest mines hitherto discovered in Cope District. They are sinking a shaft which is now 45 feet deep. It is a silver vein, from 8 to 12 inches wide, and Mr. Frazer describes it as being of fabulous richness. There are three quartz mills in operation—Norton's, Drew's and Vance's.

HUMBOLDT.

The Reno *Journal* of January 7th says that considerable ore from Battle Mountain, and other mining districts is now on hand at the Auburn Mill, but work will not be resumed until the 20th inst.

RYE PATCH.—*Register*, January 7th: One battery in the Carmony & Smith mill, was completed last Monday. On Tuesday the mill was started on ore from the Butte mine with satisfactory results. Attached to the mill is a roasting furnace, said to be an improvement on the Stetefeldt. The mill will have three batteries of five stamps each, with all the modern improvements.

REESE RIVER.

BULLION.—*Austin Reveille*, Jan. 2d: There was shipped during December, through the office of Wells, Fargo & Co. in this city, 75 bars of silver bullion, weighing 6,188 pounds, of the value of \$85,214.17. During the year 1870, the office shipped 754 bars, weighing 60,215 pounds, of the value of \$895,888.71.

MONTEZUMA.—Same of 3d: Mr. McGlew arrived here yesterday from this district, 130 miles southeast of Austin, with the first run of the mill just erected by himself and Mr. Dawley. Some 40 tons were crushed which produced 700 pounds of bullion of the value of \$6,000. The ore is taken from the dump as it comes.

EUREKA DISTRICT.

MOUNTAIN CHIEF.—*Sentinel*, Jan. 7th: This series of mines, viz., the Monarch, Weller, Mountain Chief and Miranda, is developing well; an incline on the Mountain Chief being down sixty feet, carrying quartz and chlorides the whole way, with indications of reaching the main body within twenty feet. The ore on the surface, though of low grade, will pay for sending to mill, at the reduced prices. The tunnel to prospect the four ledges at the same time is forty feet into the hill-side, with promising indications.

ELY.—*Record*, Jan. 1st: The bullion shipments of the Meadow Valley Co., for the week ending December 30th, amounted to 28 bars, valued at \$31,622.50. Barnum W. Field shipped 3 bars valued at 2,900. Ely & Raymond \$16,117.82, making the total for the week \$50,642.72. This does not include any shipments from the mills at Silver Park, run on ore from this District. The Creole ledge is being worked by two parties having contracts; the east end by Randall & Co., and west by Flood, Casey and others. Both are doing well. Flood & Co. are taking out very rich ore and plenty of it. By the 1st of February at which time their contract expires, they will have on hand 600 or 700 tons of ore. The contract on the east end of No. 7, run by Scott & Byrnes, has expired, and they have one hundred tons on the dump.

WASHOE.

CHOLLAR-POTOSI.—*Enterprise*, Jan. 8th: This mine is looking well. No new developments made. Last week there were mined 1,673 tons of ore, and of this were forwarded to the mills 1,472 tons. The average assay of the ore extracted has been \$64.25 per ton. The total yield of bullion for December has been \$505,654. The late dividend of \$10 per share aggregated \$280,000. The last run of 28 days by the Mexican mill, Carson River, yielded 4,290 pounds of bullion, worth \$125,004.06. The mill is driven by water, and contains 44 stamps and 24 pans.

OPHIR.—The Ophir Co. are driving ahead the up-rise from their south drift. It is intended to prospect the old ninth level of the mine near the Central line, just below where the pay-ore was lost when work was discontinued on the ninth.

SEGREGATED BELCHER.—But little work is being done. Work on the drift for the east body will be resumed next week. About 10 tons of ore raised per day. During the week a considerable amount has

been sent to the Eureka mill on Carson River.

WHITE.—The White lead, lately struck in working the Succor, has been drifted upon 35 feet south. The lead is now 12 feet in width. We saw an assay of ore which goes \$84.84 per ton.

IMPERIAL-EMPIRE.—Prospecting drifts are still being run as feelers. It is pretty certain that there is nothing east on the 1,300-foot level. The prospects not flattering at present.

OVERMAN.—Work is going on in the northern part of this mine and the usual ore is being extracted. Owing to legal troubles no work is being done in the southern sections.

GOULD AND CURRY.—About the usual quantity of ore extracted. Considerable work is being done in prospecting the upper portions, but no large deposits have been found.

DANEY.—The drift from the bottom of the shaft for the new level is still in hard rock, but is in 18 feet. Everything going on smoothly.

SIERRA NEVADA.—The mill is again regularly at work. Pans are being put into the Sacramento mill.

SAVAGE.—The winze on the 9th level, near the Hale & Norcross line, is down 60 feet, and all the way in good ore.

HALE AND NORCROSS.—The ore breasts in this mine are yielding well. The continued prosperity of the Co. is assured by the ore in sight and known to exist.

VIRGINIA CONSOLIDATED.—Still drifting west and still driving the branch drift toward the old Central ground.

CALEDONIA.—Nothing being done in this mine, it being shut down by the injunction obtained by the Overman.

SUTRO TUNNEL.—The Sutro Tunnel was yesterday in 1,760 feet. The ground works well. The water is increasing at the face of the tunnel.

CROWN POINT.—There is some improvement in the new body of ore south on the 1,100-foot level.

BELCHER.—No new developments and only low grade ore being extracted.

GOLDEN AGE MILL.—The mill, now being erected in Silver City, is approaching completion. The battery and other timbers are on the ground; the machinery is almost ready to set up, and the Superintendent says he will be ready for crushing on February 1st.

EMPIRE CITY.—The Carson City *Register* of Jan. 8th describes the Morgan Mill, belonging to the Yellow Jacket Co. It is run by a Leffel turbine (double-action) 66 inches in diameter. The mill commenced a run on the 2d, and yesterday it was estimated that the amalgam chests contained 250 pounds of bullion.

WHITE PINE.

ITEMS.—South Aurora keeps up its regular bullion shipments. North Aurora gives out more ore than can be conveniently hauled away. Eherhardt continues as good as ever. As soon as the tramway is finished a larger force will be put to work to take out some of the ore now exposed. O. H. Treasure takes out enough ore to keep the Swansea mill running day and night. Silver Wedge has indications of soon striking a large body of good ore in their shaft, which is 10 feet deep. Any amount of low grade ore in sight. Treasure Hill M. and M. Co., continue work on their claims, Posthole, Iceberg and Summit, with good prospects. Anchor is taking out good ore. Wabash is working in fair ore. We hear that the Great Basin is going to start up work on these mines on an extensive scale.

MILLS AND FURNACES.—The International machinery—stamps, pans, engine and boilers—is now in place, and the whole is receiving the finishing touches.

The erection of the posts for the tramway goes ahead. Big Smoky Mill has been running steadily. The new furnace will be started up during the week. Metropolitan is working with good results. Oasis is running on ore from the Earl mine, and is shipping plenty of bullion. Swansea Mill on Hidden Treasure ore, running day and night. Chicago Mill will be shipped in a short time to Pioche. Monte Christo is running again, and crushing ore from the Maryland mine, in Piute District. The Alsop Furnace is still shipping large amounts of base bullion.

SMEETING.—Hereafter the three furnaces of the Eureka Cons. Co. will be running constantly at an average of about 13 tons of bullion per pay. The Buttercup Co. at an average of five tons per day—the W. J. Bevan at an average of three tons—the Jackson six tons—the Ogden, Dunne & Co., at an average of five tons per day, and the Wilson, Robertson & Co., at an average of four tons per day.

PIOCHE.—*Ely Record*, Dec. 25th: The bullion shipments for the week ending December 23d, are as follows: Meadow Valley 23 bars valued at \$30,592.36; Barnum W. Field, 1 bar valued at \$1,550. Total \$32,142.36. The shipments by Ely & Raymond, from their mill at Bullionville, via Salt Lake, amount to \$15,296.19, making the week amount to nearly \$50,000.

EUREKA.—*Sentinel*, Dec. 24: The strike of the year.—Some party has made a discovery of the best ore, and the largest quantity ever found in this district, at Secret Cañon, near the mines of Geddes & Bertrand. The assays run into the thousands. There are 10,000 tons ore on dump here which will work above \$100 per ton. "Bonding mines" is going into disuse. The mill of the Mineral Hill Co. produced \$40,000 worth of silver bullion in the first 20 days of December.

VANDERBILT.—Same of Dec. 31st: The Hodgdon mine was bought last week by the Sierra Valley Mill Co. at \$12,000, and 12 men put on to work it. In 20 days from the time the company took possession of the mine they will have worked enough ore to pay for the mine. [We have for some reason failed to receive a single copy of the *News* this week.—E.D.S. PRESS.]

Colorado.

GRAND ISLAND.—*Central City Register*, Dec. 21st: A new and immensely rich pocket has been struck in the west end of the Cariboo mine. From 4 o'clock in the morning until 11 o'clock, four men took out 28 sacks of ore, each weighing from 275 to 300 pounds. It is estimated that this amount of ore is worth \$5,000, as it appears to be as good as another lot sold to Prof. Hill a few days ago, that assayed over 1,000 ounces per ton.

GOLD SHIPMENT.—Thatcher & Co. shipped 600 ounces of gold yesterday, worth \$10,000, making for the month so far, \$30,000. Of this, the California lode furnished 245 ounces, the Collins claims 122, the Stalker mine 123, and Rhoderick Dhu 100.

SUDERBORG.—Same of 28th: A week's work yielded 16 cords of mill ore, that produced \$2,970. During the same time, 30 tons of smelting oresold for \$1,350, making a total of \$4,320 for the last week's work.

ITEMS.—Same of Jan. 4th: The mills are mostly stopped by the freeze. A retort from the Suderborg, 4½ cords ore, weighed 50 ounces. Mr. Waterman had a retort of 60 ounces. Messrs. Cave & Miller Bros., on the Gregory Second lode, are putting up an engine and hoisting works, and expect to be raising ore by the first of next week.

LAKE COUNTY.—*Oro City Cor.* of same: The Pilot lode gave 35 ounces of gold from one pan of dirt. The lode is owned by the four discoverers, who do all the work. The Printer Boy is taking out rich quartz. At Granite all appears at a stand still. The old Treasure Co. have found good pay in the Dowley lode. They appear to be waiting for something to turn up. The Yankee Blade Co. have been talking of starting again, but there appears to be too many in the Co., so somebody must be frozen out. Eastern companies own these two mines.

GEORGETOWN.—*Cor.* of *Herald*, Dec. 31: The "Norman" is the first lode which will be reached by the Burleigh Tunnel. It carries 80 ounces of silver per ton, and plenty lead for smelting. The Magnet main shaft is 45 feet deep, and the vein of rich ore 10 inches wide. Stewart returned 260 ounces for the last lot run.

Georgetown *Cor.* of *Register*, Jan. 4th says: The Silver Plume is reported promising. Recent assays place it far ahead of the Snow Drift lode. A new vein of rich sulphurets is reported to have been struck in the White lode. The prospects indicate that it will shortly be acknowledged the largest and richest lode in Griffith District. One ton and a half of sulphurets from the E Pluribus Unum lode gave \$500 currency at Stewart's works.

GEORGETOWN.—*Miner*, Dec. 22d: John Coburn showed us an assay button from Sterling ore. The ore 82 feet from the surface, assayed \$11,306.

Same of 29th: First class Willow ore assays 400 ounces per ton. Six tons Mendota ore gave 52 ounces silver per ton.

Same of Jan. 5th: The Brown Co. shipped yesterday a "button" of silver weighing 3,378.9 Troy ozs., coin value \$4,392.57.

TERRIBLE.—The ore from this mine is reported in the *Louden Mining Journal* at something over \$700 per ton.

Idaho.

ITEMS.—*Avalanche*, Dec. 31st: The Oro Fino is yielding ore that, we are informed, will pay \$60 per ton. The quartz mill at Fairview is completed, and will be put in operation next week. The new engine at the Golden Chariot is being put in place, and will be ready to run in about a week.

BULLION.—The total shipments for 1870, per Wells, Fargo & Co., amounted to 391 bars, valued at \$806,074.49.

SNAKE RIVER MINES.—*Boise News*, Dec. 31st: Mr. Hunter informs us that, owing to the inclemency of the weather, mining operations have about closed.

Montana.

RETORT.—*Helena Gazette*, Jan. 3d: Yesterday we saw at Hirschfield & Co.'s bank a lump of gold retort which weighed two hundred and ninety-five ounces, the result of ten days' run from quartz from the Parkinson lode, taken out by the Whitlatch Mining Co., and crushed at the Whitlatch mill.

CABLE CITY.—*Cor.* of same: The Hanner mill is crushing rock from the celebrated Atlantic Cable mine. The Cameron Co. are taking out quartz at a depth of one hundred and fifty-two feet. The Cable City mill is lying idle, subject to arbitration.

PHILIPSBURG.—*Cor.* of same: The stamps of the J. Stuart mill are again in motion, and it seems evident that the management is business-like. It labors under great disadvantages, however; and if the enterprise proves a success in spite of them, there need be no further doubt about the stability and permanence of the Flint Creek silver mines. The C. S. S. C. Company's smelters have ceased to operate. They are talking of a further experiment.

QUARTZ.—*Helena Herald*, Jan. 5th: Mr. Noble, on Wisconsin Creek, near Sheridan, is taking out from one to three tons of gold quartz per day, and working the same in an arrastra. The ore yields an average of \$23 per ton.

The Deer Lodge *Independent* of Dec. 31st says the mill at Philipsburg stopped for repairs after running two days. Three hundred tons ore on the dumps and ten men taking out more. It will average \$40 per ton. The smelting works at that place had stopped because they were not suited for the ore.

Mexico.

CHIHUAHUA.—The *Santa Fe Post* of Dec. 24th has a letter from El Paso, dated Dec. 11th, with further news from the rich placers. We give an item, which reads like the California news of '49. "Some of the principal merchants in Chihuahua have formed a company, and are working a small and very indifferent rocker. On Tuesday week, they took out with twelve men, in eight hours, 37 ozs. and 4 dwts. of gold, and on the following day, \$500. These twelve men have averaged since they began work, over \$300 per day. This with dirt taken at random from the gulch, in no place more than three feet from the surface."

Oregon.

CANYON CITY.—The *Dalles Mountaineer* of Dec. 24th says: Mr. James Clark reports that all mining operations have ceased on account of the cold weather.

WILLOW CREEK.—*Boise News*, Dec. 31st: Messrs. Boswell, Moore and others have just completed the construction of a pump, to be run with horse power, to prospect their claim. The Co. intend to continue their ditch to an abundant supply of water as soon as the opening of spring.

Utah.

TINTIC.—*Salt Lake Tribune*, Dec. 31st: The Tintic lode is being worked by Eddy, Mathews, Hastings & Co., night and day. This Co. have purchased an interest in the Anthony Wayne, also 400 feet in Sidney Worsley, in the Eureka. For the latter they pay \$5,000, cash. The James Bird, showing rich mineral, will be developed by the same company. Messrs. Brewer, Gyde & Co. have resumed work on the Lafayette, which is showing a 2½ feet vein of rich ore. The Shoebridge and Uncle Sam lodes are being worked, and good paying ore is taken out. The Pioche ore are nearly ready to resume their labors.

The Cottonwood furnaces were to be running by January 1st.

Mining Stocks.

SAN FRANCISCO, Thursday Eve., Jan. 12.

The mining share market has been moderately active during the past week. On Monday, the election of the Board resulted as follows: President, J. B. E. Cavalier; Vice-President, E. E. Eyre; Caller, H. B. Coit; Secretary, F. Lawton; Treasurer, H. Schmiedell; Sergeant-at-arms, T. M. Blair.

Light sales of Alpha and Amador, at 4 and at 320 to 325 respectively have occurred. Belcher has been quite active at 7 to 8½. Chollar has sold from 78 to 72. The receipts for December were \$505,654. On the 5th, \$100,204 were shipped from the mine, from which were

taken, last week, 1,673 tons of ore, assaying \$67.24. A dividend of \$5 per share (amounting to \$140,000) was paid on the 10th, and another of the same amount is payable on the 16th. Crown Point has been lively at 18 to 20. The mill crushed, last month, 1,350 tons of ore, which yielded \$32,357, or an average of \$23.96 per ton. Daney has sold at 3 to 3½. An assessment of \$1.50 per share has been levied, delinquent Feb. 14th.

The Eureka (Cal.) Company, on the 3rd, increased the capital stock from \$1,200,000 to \$2,000,000, divided into 20,000 shares of \$100 each. Eureka Consolidated has been lively at 16½ to 15½. Golden Chariot has sold from 65 to 70. The dividend paid on the 10th amounted to \$40,000. The December receipts were \$76,277. Gould and Curry has varied from 43 to 51; Hale and Norcross from 106½ to 98½. The latter company paid a dividend of \$5 per share (\$40,000) on the 10th; 1,100 tons were extracted from the mine last week. Ida Elmore has sold at 10, and Imperial at 19 to 15. Kentuck has been dull at 34 to 38.

Meadow Valley has been in good demand at 25½ to 27½. A dividend of \$1 per share was paid on the 9th. December receipts, \$151,675. Opbir has sold at 3½ to 4; Original Hidden Treasure, at 3 to 4½, with large sales last week. Overman has been quoted at 2½ to 5½. Last week 559 tons of ore were extracted from the mine. Savage has been lively at 5½ to 56. From the mine, 1,375 tons were raised last week. December receipts, \$71,400. Silver Wave sold twice, at \$1 and at 50 cents. An assessment of \$1.50 is now delinquent. Yellow Jacket has sold largely at 43½ to 38.

North Star paid a dividend of \$9,000 on the 10th. The receipts for December amounted to \$19,400. The Union Pacific Salt Company have declared a dividend of ¼ per cent., payable immediately. An assessment of \$2 per share on the stock of the North Bloomfield Gravel M. Co. became delinquent to-day. Yellow Jacket paid \$48,000 in dividends on Tuesday.

SIERRA NEVADA M. Co.

The annual meeting of this company was held on Monday, when the following Trustees were elected: M. J. McDonald, L. Vesaria, O. H. Bogart, A. Hemme and G. W. Cope.

RECEIPTS.	
From Bullion.....	\$220,287

Average cost of mining and milling \$6.68; average yield of ore from January to July, \$8.46; and from August to December, \$16.09 per ton. A dividend of \$1 per share becomes payable on the 16th.

GOLD HILL QUARTZ MILL AND M. Co.

The annual meeting of this company was held on Monday. The following were elected Trustees: A. Hemme (President), R. Wegener (Secretary), W. C. Ralston (Treasurer), P. G. Venard, L. Imbaus, C. Gignoux and C. Friedberg. Superintendent, H. Hugnet. The receipts for the year amounted to \$87,192, of which \$17,287 was from bullion produced, \$37,206 from the operations of the mill, and \$15,000 from two assessments, levied in May and September. The disbursements embraced \$42,210 for milling, \$6,878 for mining, \$9,088 for improvements and \$5,661 for general expenses. The assets consist of book accounts to the amount of \$12,939, against which there are liabilities amounting to \$9,560, showing a surplus of \$3,379.

New Incorporations.

The following have filed certificates with the County Clerk, San Francisco.

PHENIX M. Co., Eureka District, Nevada.—Dec. 7th. Capital Stock, \$200,000. Trustees: J. B. Haggin, G. Hearst, J. M. McDonald and A. E. Head.

BAY CITY SONA WATER Co.—Dec. 8th. Capital Stock, \$100,000, in 1,000 shares. Trustees: J. F. Robe, C. Turner, H. K. Rice, H. Brader.

B. D. Ellenkamp, J. J. Bliven and J. McEwen.

GOLDEN STATE RELIEF ASSOCIATION.—Dec. 17th. Directors: A. Badlam, W. V. Wells, A. K. Stephens, A. P. Sutton and C. W. Jones.

CAL. BARREL CO.—Dec. 17th. Capital Stock, \$500,000, in 5,000 shares. Trustees: W. LeRoy, C. T. Forrest, A. C. Hnssey, A. J. Lord, B. F. Bonton, D. A. McDonald and H. Chapman.

NEVADA CONS. BORAX Co. Nevada.—Dec. 19th. Capital Stock, \$3,000,000, in 100,000 shares. Trustees: W. S. Bell, W. Troop, J. W. Lynch, C. Myrtnes, J. L. Sanford, S. E. Holcombe, W. E. Brown, W. R. Chmness and O. Walker.

JACOBSON M. Co. Eureka District, Nevada.—Dec. 22d. Capital Stock, \$5,000,000 in 50,000 shares. Trustees: J. D. Fry, W. H. Clarke, C. C. Goodwin, W. T. Lockhart and A. E. Head.

EUROPEAN AND OREGON LAND CO.—Dec. 23d. Capital Stock, \$5,000,000, in 50,000 shares. Trustees: E. H. Green, A. DeLaski, R. Sulzbach, J. E. May, F. D. Atherton, W. C. Ralston, M. S. Latham, B. Holladay, W. F. Roloffson, W. Morris and L. Tevis.

HOPE GRAVEL M. Co. Grass Valley.—Dec. 24th. Capital Stock \$1,200,000, in 12,000 shares. Trustees: L. P. Penny, J. E. Marchand and J. W. Jenkins.

CAIMUS M. Co. Nevada.—Dec. 27th. Capital Stock, \$1,000,000, in 10,000 shares. Trustees: A. W. Bowman, H. A. Cheever and A. J. Page.

BRANSHAW M. Co. Nevada.—Dec. 28th. Capital Stock, \$2,000,000, in 20,000 shares. Trustees: W. H. Sharp, S. Steinhart, and W. Seligsberg.

ELECTRICAL CONSTRUCTION AND MAINTENANCE CO.—Dec. 28th. Capital Stock, \$100,000. Trustees: G. H. Mumford, J. Gamble, G. S. Ladd and S. D. Field.

LAND MORTGAGE UNION.—Dec. 31st. Trustees: J. H. Fish, J. M. Johnson, J. Morton, W. Sherman, E. V. Hathaway, E. D. Sawyer and T. R. Hayes.

RAYMOND AND ELY M. Co. Nevada and Utah.—Dec. 31st. Capital Stock, \$3,000,000 in 30,000 shares. Trustees: S. F. Butterworth, A. Bull, G. D. Roberts, W. H. Raymond and C. J. Buchanan.

The following have been recorded in the Secretary of State's Office, Sacramento.

CENTRAL PACIFIC M. Co. Nevada.—Dec. 12th. Capital Stock, \$200,000 in 2,000 shares. Trustees: F. H. Smith, W. W. Gupill, C. S. Mott, C. Cogan and D. H. Faslin.

CAL. AND ARIZONA R. R. Co.—Dec. 22d. Object, to build and operate a railroad from Wilmington, Los Angeles Co., to Wickenburg, Arizona. Capital Stock, \$5,000,000. Directors: P. Banning, D. W. Alexander, H. Van Valkenburg, H. Jacoby and E. N. McDonald.

CALIFORNIA CENTRAL R. R. Co.—Dec. 29th. Object, to build road from Benicia to Red Bluff. Capital Stock \$5,000,000. Directors: A. Redington, S. F. Butterworth, B. M. Hartsborne, J. Binsley and W. H. Taylor.

Meetings, Elections, Etc.

ANCHOR CONS. M. Co.—Dec. 9th. Trustees: J. C. Wade (President), C. E. Fairbanks (Vice President), G. W. Browning, T. C. O'Reilly and J. G. Crocker. Secretary, A. Noel.

BUENA VISTA VINCULATED CO.—Dec. 21st. Trustees: W. Blanding (President), C. Christensen (Vice-President), W. C. Ralston, O. C. Pratt, C. Baum, J. Binsley, C. Koebler, B. E. Anger, and W. M. Rockwell, Secretary, M. Phillips.

HIDDEN GRAVEL M. Co.—Dec. 27th. Trustees: L. Terse Jr. (President), W. Curman (Vice President), W. A. Bateman, H. K. Moore and D. Wilder (Secretary).

CAL. CENTRAL R. R. Co.—Directors: A. Redington (President), S. F. Butterworth, W. H. Taylor (Treasurer), B. F. Hartsborne and J. Binsley. Secretary, J. T. Hoyt.

THE VINEYARD.

Profits of Grape Growing.

In order to realize the largest profits from any branch of fruit growing. Care and judgment must be exercised in the selection of the varieties to be cultivated. In the matter of grapes, for example, two and three times the amount of profits may be derived from some kinds of grapes, over that obtainable from others, when raised for the table.

Enormous profits are realized from some of the vineyards in the immediate neighborhood of this city, especially where proper judgment has been employed in the selection of varieties and corresponding care of their culture. The following figures have been given as reliable and trustworthy:—Mr. Shaw has realized as high as \$420 per acre, gross, from his Muscat of Alexandria vines—he has reported an annual average of \$270 net. Meister Brothers, report still larger profits—\$273 per acre gross, and \$775 net from the Alexandria Muscat; and over \$450 from black Hamburg, black Malvoise, golden Chaselas and White Tokay. He has reported as high as \$2,300 net per acre, from small lots of very rare varieties, such as have commanded an exceptional price in the market.

The mission grape, the most abundant, and least valuable, has paid as high as \$100 net, when carefully cultivated for the table, and convenient to the market. When we consider the small average profit from an acre of wheat, or other grain or root crops, it would appear evident that those Californians who have large numbers of choice vines, well bearing and in good locations, must be getting large interest for their investment.

Of course grape growing, for wine, is a very different affair, and less profitable; but wherever a sufficient amount of grapes can be found in any given locality to sustain an extensive wine manufactory, the profits for the vineyards, even the most ordinary, is many times that which can be realized from wheat culture, even when the fullest allowance is made for the cost of planting and bringing the vineyard to maturity.

The culture of the grape for wine or raisins is a branch of agriculture that can be most profitably and conveniently followed in the lower portions of our mountain counties, and should be everywhere encouraged. With the other branches of business, which its presence will introduce, it may be made one of the most ready and effective means of advancing our mining counties from their present state of financial depression to the very height of prosperity.

As an evidence of this let us look at a few facts with regard to the vineyards of France, as they were before the commencement of the present devastating war in that country. There are 5,500,000 acres of vineyard in that country, distributed among a population of about 3,000,000 people nearly all of whom are either directly or indirectly dependent upon that business. The vineyards are generally divided up into small areas, averaging about 2½ acres each. The average yield of wine is about 250 gallons per acre. Many vineyards yield a profit of \$300 per acre, per annum. The choice vineyard land, with the vines thereon, is worth from \$2,500 to \$5,000 per acre. The vineyards of France feed, either directly or indirectly about one-tenth of the entire population of that country, and create enormous annual values, said to represent something like \$260,000,000 a year. It will be seen that the yield of the wine in France, is set down much below the average of our California vineyards. This State has nothing to fear, in the future, from France in this business; and the values there created and the population then supported may easily be realized in our own State—and nowhere more readily than in our foothills—the natural home of the vine.

Pruning Grape Vines—A New Idea.

EDITOR PRESS:—I notice that the *California Horticulturist*, of December, advises "owners of vineyards to prune their vines as soon as time and circumstances will admit."

There has been a great deal written, *pro* and *con*, on early and late pruning of the grape vine, and there are some facts that are worth considering. I hardly think it proper to advise indiscriminately.

Vines grown in scanty soil and in dry parts of the State—the interior valleys and foothills of the Sierra Nevada—should be pruned before the sap starts in the spring, as they require all the nutriment which has been collected and stored in the roots; but vines grown in moist, rich soils, near the coast, are better pruned in the spring. The profuse "bleeding" is rather a benefit, as the vines then run less to wood, and fruit better; if so exhausted, moreover, the fruit is less liable to mildew, and is sweeter than on vines early pruned.

It is a well known fact that in the hot, dry valleys and foothills the vine is prolific of fruit and is not over vigorous; while about San Francisco Bay, and within the full influence of the moist sea breeze, the grapes are more acid, watery and soft, the

HALL'S PATENT HUSKING GLOVE.

vines less productive, and great runners. Not only is it well to "bleed" the vine in such localities, but it is also well to

Crop the Vineyards

with early vegetables—peas and such kinds of plants, as will exhaust the soil of moisture and strength.

This idea will probably be new to most of the readers of the Press. Indeed, I believe it is a new idea in fact; but it is worthy of trial. I have seen two small vineyards in San Jose, side by side—one pruned early, and well cultivated; the other pruned late and not tilled at all—everything else being equal. The one not pruned or cropped was a failure in fruit; while the one late pruned, and cropped to grass and weeds, produced an abundance of fine quality of fruit.

S. HARRIS HERRING.

MONTANA IRRIGATING CANAL.—The *Helena Gazette*, which keeps us well posted on many important matters in its territory, gives the following concerning the Jefferson Canal: It is taken out of the Jefferson, near Silver Star, and is calculated to carry 20,000 inches of water. It covers a great deal of fine farming land on Fish Creek, White Tail Deer Creek and Boulder; passes behind Radersburg, close to the mountains, and covers the entire Missouri Valley from Helena to that point. The extreme length from the point where it is taken out to Helena is one hundred and sixty miles, and presents little or no difficult work on the route. The arable land which it covers consists of twenty-five townships, each containing 36,000 acres, or a total of 576,000 acres, being the largest amount of arable land in any valley of the Territory, and far more than can be covered by any similar work. Besides these agricultural lands thus proposed to be rescued from the wilderness, the canal covers many valuable placer mines, including those near the Jefferson, those on Indian Creek, those on Beaver Creek, Mitchell's Gulch, McClellan Gulch, Prickley Pear, the lower part of Holmes' Gulch, and gulches and bars between that and Helena, and lastly, the immense Helena bars.

Corn Huskings.

To many of the elder portion of our readers, the above title will recall memories of former merry-makings at the East. Scenes of busy hands and cheerful faces, the old barn, the piles of grain, the finding a red ear of corn and its consequences, may be conjured up. The name has to many of both sexes a forcible significance.

One little drawback on such occasions was the unpleasantness of getting the hands sore. The constant friction, the wear and tear, was severe on those whose skin had not attained a very considerable degree of toughness. Our illustration shows a device for preventing this, and of enabling one to do the work more rapidly. The invention consists merely of leather gloves, of the form shown in the cut, which are provided with metallic claws attached, which assist in tearing the husk from the ears. These gloves protect those parts exposed to the wear from the husks, and enable one to husk perhaps double the amount otherwise possible.

The glove with the small claws is made to enclose the thumb and forefinger of the left hand, and the glove with the large claw to enclose the thumb and first two fingers of the right hand. They are laced

MANZ-CHICAGO

and strapped to fit. The ear of corn is held in the left hand and one-half of the husk is stripped with the right. Then the remaining part of the husk is started by a side movement of the left thumb past the edge of the ear, and stripped back with the thumb and forefinger. At the same time the ear is grasped with the right hand and broken off across the left.

It will be seen that it is not necessary to commence at the end of the ear, as with other huskers, but the ear may be grasped two or three inches back from the end where most convenient. The thumb of the right hand should fit between the large claws of the fingers of the same hand, when they are pressed together, which gives a very firm hold of the husk while stripping it off. It is important to pull lengthwise of the plate and across the fingers, instead of across the plate and lengthwise of the fingers, a mistake made by many.

Testimonials from farmers are given, showing that the gloves are highly esteemed wherever used. We have a pair at our office, which we retain, not so much from an expectation of using them in corn, but as a means of offense and defence in possible emergencies. The gloves have been patented and are manufactured by the Hall Husking Glove Company, 90 and 92 South Water street, Chicago, Ill. They are made of three sizes, and for both right-handed and left-handed persons.

THE PEELER COTTON.—The *Georgia News* says: "This variety is giving satisfaction. It is rapid in its growth, matures early, is very prolific, and the staple is almost if not quite, equal to the black seed—long, silky and strong. It ought to, and probably will, sell for ten or fifteen cents more than the ordinary cotton. It will be largely cultivated in this section next season."—The Peeler, it will be observed, is one of the varieties recommended for cultivation in this State.

California Agricultural Notes.

THE GRASS started around Stockton by the early rains, has been much of it, destroyed by the recent frosts.

THE COLD WEATHER has killed a great many sheep in the upper San Joaquin valley.

THE farmers around Woodland are holding on to their wheat, believing that the want of rain for the new crop will produce an advance in price.

Cows and young calves are said to be dying on the plains about Marysville for want of feed.

LARGE EGG.—The *Solano Republican* has received an egg measuring 6½ by 7½ inches in size.

MILK FOR SAN FRANCISCO.—There are 200 wagons engaged in supplying this city with milk. They deliver 12,000 gallons every day—including the water added.

TULE LANDS.—The *Vallejo Chronicle* of December 29th says: Smith & Co., who have been reclaiming some lands a few miles above Vallejo, have nearly completed the reclaiming of about 11,000 acres, all required now being but the erection of a few flood-gates. This they have sold at a fair price, and in the coming spring intend commencing the reclamation of another large tract.

PARASITES IN WILD GAME.—The *San Jose Independent* of the 4th inst., has the following: Mr. E. W. Hamilton yesterday showed us a duck which he shot on Cayote creek on Sunday. The flesh of the breast was filled full of parasites, the size and appearance of the common maggot. Otherwise the bird appeared to be in a healthy condition. The parasites were embedded in the tissues, while the flesh surrounding them appeared to be perfectly free from any disease. The flesh was entirely unbroken, and there was no trace of a wound anywhere.

We learn that the farmers around Davisville are much discouraged from the want of rain, and that they have now quit plowing. They have suffered recently from a strong north wind, which dries up the ground, and has a very prejudicial effect upon farming operations.

THE *Chico Enterprise* of the 31st ult. says: Notwithstanding our cold, freezing nights, our farmers are plowing, the ground still being in good condition. We are favored; as we have been informed that the lower counties are suffering for want of rain, and plowing is entirely stopped.

AROUND Haywood the farmers are plowing deeper than usual this year. They state they will be compelled to stop work unless it rains within a few days. Cattle are suffering for want of feed. The grass is very short and has been cut down by the heavy frost.

LIVE FENCES.—About two years ago a number of farmers at the upper end of this county, says the *Vallejo Recorder*, commenced setting out live fences, mostly of Osage orange. They have been growing very rapidly, and now strings of live fences, five or six miles in extent, may be seen there. The farmers encouraged by the wonderful growth of this kind of fencing, and its many advantages, have been setting out live fences very extensively this winter.

ORANGES AND CORK OAK.—The *Visalia Delta* of December 7th has the following: We have had extraordinary heavy frosts lately, but we notice that it seems to have no effect upon our orange trees, those that are in bearing look perfectly healthy and will undoubtedly mature the crop. There is a region along the margin of the foothills much more free from frost than the valley around Visalia, and there can be no doubt but that this region is as well adapted to the production of the orange as any portion of the State. We notice also that the few specimens of cork oak, that have been planted here are healthy, and have made a growth quite equal to that of our native live oak.

GROWING COCONUTS.—A resident of Yuba county, says the *Marysville Standard* of the 30th ult., having been successful last year in growing a cocconut, it having reached a height of two feet, a number of our citizens are also experimenting with this tropical fruit. We made a thorough examination of a lot of cocoanuts at Knight's fruit store a few days ago, and found five that had live sprouts about an inch in length. The plant germinates through what we call "the mouth of the monkey," said germ being carefully protected from cold and injury by the husky bark which covers the end. The experiment of growing cocoanuts in this climate is one worth trying.

POPULAR LECTURES.

Theory of Mineral Veins.

[Prof. JOSEPH LECONTE before the MECHANIC ART COLLEGE. Reported expressly for the PRESS.]

LECTURE VI, January 7.—In my last lecture, said Prof. LeConte, I spoke of the mode of occurrence, the structure, the contents, and the surface changes of mineral veins. I have now to speak of the important laws affecting the occurrence and also the richness of these veins. These have never before been collected and grouped together in any publication.

Rules of Occurrence and Richness of Veins.

1. Mineral veins occur mostly in disturbed and metamorphic regions, where the rocks have been tilted and broken and have undergone changes—been metamorphosed—through the action of heat and water. These conditions occurring in mountain ranges, mineral veins are, consequently, principally in mountainous districts. The only general exception is the occurrence of lead veins, which are often found in flat, level regions, as is the case with the lead mines of the Mississippi Valley.

2. Mineral veins occur mostly in the older rocks, especially in the Azoic and Paleozoic. In England not one worth working occurs above the Triassic. This is true as a general rule, but has been pushed too far by the older geologists, because their geology was founded mostly on facts derived from examinations made principally in England and France, where the theory would hold. It was an old idea that there was a metalliferous age just as there was a carboniferous age; yet we have seen (from the preceding lectures) that even the carboniferous age does not include all the coal deposits. The idea of a metalliferous age is wrong. In California we have veins in the Triassic, Jurassic, Cretaceous, and even to some extent in the Tertiary periods, but always under the conditions named above, under Rule 1. The reason why the older rocks generally contain more veins is because they are generally more metamorphosed. But where we find the younger rocks thus changed, we may also expect to find veins.

[To refresh our readers' memories and render these remarks clearer, we append the following table of geological eras and periods, commencing with the latest. ED. PRESS.]

Recent.....	Age of Man.
Kainozoic.....	Post Tertiary.
	Tertiary.
	Cretaceous.
Mesozoic.....	Jurassic.
	Triassic.
	Carboniferous.
Paleozoic.....	Devonian.
	Silurian.
Azoic.....	Azoic.

3. If we have a number of veins in a given locality, those parallel with one another generally

ally have similar metallic contents. A good example is shown in the accompanying diagram (Fig. I) which is a rough sketch of Cornwall. Here we see two systems of veins, one running east and west and another running north and south. The latter are called "cross courses." The east and west veins contain copper and tin. The north and south veins contain neither copper nor tin, but only some iron and lead and are generally considered worthless.

The reason of this is that the parallel veins generally belong to the same system, were formed at the same time and by the same movement of the earth's crust and were filled under the same conditions and from the same rock. Other veins were formed at different times and under different circumstances. Thus, in Cornwall the east and west courses are known to be older than the north and south ones. The former break through the paleozoic and triassic rocks, but do not break through the jurassic; the latter break through the jurassic and even the cretaceous. In California, the auriferous veins are all parallel to the trend of the Sierra Nevada and were probably produced by the same movement which threw up that range.

4. If we trace a vein a long distance, we find that it often breaks through different surface rocks, and that a change of rock generally is accompanied by a change in the richness and even in the nature of the metallic contents, although this last change is not always so great as we might perhaps expect. There is a difference here between the mineral veins we are treating of, and the veins of infiltration alluded to in the last lecture. As the latter depend entirely on the nature of the enclosing rock, a change of the last produces an entire change in the vein, which is not necessarily the case with our mineral veins.

5. Veins are generally richer where they come in contact with igneous rocks in the form

of granite or trap rock, particularly when there is an accompanying contact-metamorphism. To this rule lead veins often form an exception.

6. When veins cross, especially at a small angle, they increase often in richness at the crossing. We can give no good grounds for this with our present knowledge. Possibly, if formed by waters, there may be some chemical relations which cause it.

7. In the case of slips, the foot-wall generally has gone upwards, the hanging wall downwards.

Fig. II

wards. Some exceptions to this rule have been known, but it generally holds true. Fig. II will serve to show this.

8. The law of surface changes. This has been explained to a sufficient extent in the last lecture. [Given in the SCIENTIFIC PRESS OF Dec. 24, 1870.]

Old Theories of Mineral Veins.

There is probably no subject which has given rise to so many theories as that of the formation of mineral veins. There is now a widely spread popular prejudice against theories and theoretical men, and an invincible distinction is made between so-called "theoretical" and "practical" persons. This is partly right and partly pernicious. There are two kinds of theorizing:—that merely for the sake of theorizing and showing off one's mental agility, which has been only too common, and is rightly despised; and that which seeks only truth and truth only, which should be fostered. The prejudice is wrong in that it makes a distinction between true theory and true practice, which cannot be separated. It is just as impossible to have any truly practical science without theory, as it is to have any science without facts.

Until recently many of the wildest and most vague theories have preponderated. Some of these, which have obtained largely even among scientific men and publications up to the present day, may be mentioned here.

There has been a theory that veins were filled in the same manner as igneous dykes,—by the injection from below of melted matter. Another has been that, the fissures extending to the interior of the earth, matter below is volatilized and fills the veins with crystals on cooling. This first is the theory of igneous injection, the second is that of sublimation. Neither are true.

According to some, mineral veins are filled in the same way as veins of infiltration, explained in the last lecture. This is nearer the truth, as will be shown hereafter.

There has been a theory that the fissure were filled by solutions from which the metal were deposited by electrical currents. Now these currents do increase the tendency to crystallize and may have some influence. But the chief ground for this theory seems to be the popular tendency to refer the causes of natural phenomena to any imperfectly understood matter. Thus people attribute to electricity the earthquakes, table-tipping, etc., etc. To demand consideration for this theory, it is necessary for its supporters to show first that the phenomena follow those laws of electricity which are known. When this is done, the matter will be considered. But we stand in no need of any such theory.

The True Theory.

The true theory, in the lecturer's opinion, has been touched on in some of its relations in published works, but has not been made public in its entirety heretofore. It is this: That the fissures were filled by deposits from hot alkaline solutions circulating through them, even from the greatest depths. It is proposed now to show that the veins were filled

- I. From solutions;
- II. From hot solutions; and
- III. From hot alkaline solutions.

I. From solutions.—The peculiar structure, the ribbon structure, is as characteristic of mineral vein matter as the columnar structure is of basalt. This point tells very strongly against the fire theories and for the water theory. From the same cause we find the same structure in veins of infiltration.

Again, the most common of all vein-stones is quartz, which occurs nine times out of ten; yes, ninety-nine times out of a hundred. Now there are two kinds of quartz. One has a specific gravity of 2.8, the other a specific gravity of 2.1 to 2.2. The first is formed only by deposition from solution, the second only on cooling after fusion. The first is found invariably in metallic veins, while the second is never found there.

There are many other contents of mineral veins which cannot possibly be formed by fire, but only by water. These are the minerals containing water, the "hydrates."

In vein-stones, we very often find fluid cavities. In rocks formed by aqueous action, any such cavities contain water, while in those formed by the action of fire, the cavities contain only air. Vein-quartz, and all vein-stuff, have the fluid cavities (i. e. those containing water). This point tells against the sublimation theory as well.

II. From hot solutions.—A fissure reaching downwards is always filled with percolating waters. Now as our mineral veins extend down a great distance, these waters must be hot. The solvent power of hot (super-heated) water is well known. It dissolves many substances generally considered insoluble.

In the case, referred to above, of cavities filled with a fluid, if these were filled while hot and then cooled, as the containing crystals cannot give and the fluid contracts on getting cold, a vacuum space is left which presents the appearance of a bubble. This last we find a common occurrence. If we put such a crystal with such a cavity under the microscope, and apply heat, we can determine the temperature at which the crystal was formed; for on reaching this temperature, the fluid will have expanded to its original volume and will exactly fill the cavity, the bubble then disappearing. This fact opens a field of research of the greatest importance and interest. In this way it has been found that actual deposits have been formed at 150°, 212°, 250°, up to 400°, 600°, 800°, and 1000°. Now quartz and other vein-stuff have such cavities which have been shown to have been formed at 180° to 212° and even 300° and 400°.

It may be remarked that such cavities occur often in crystals, when, on account of the imperfect transparency or opacity of the material, they are not apparent.

III. From hot alkaline solutions.—We need a powerful solvent to get our vein-matter in solution. Our hot water probably is not sufficiently powerful. We find it in nature in an alkali,—a carbenate, particularly carbenate of soda. Alkaline waters and springs are known everywhere, and are especially frequent on our coast.

Quartz is one of the most insoluble substances known. Only a few substances will dissolve it. Its natural solvents are alkalies. In making artificial stone, etc., this fact is taken advantage of. Again, as the metal is enclosed in the quartz, we must believe that it was deposited from the same solution. It has been shown before that most metallic minerals occur in nature originally as sulphides. Now alkaline sulphides will dissolve metallic sulphides. These alkaline sulphides are abundant in springs in California and elsewhere. Most of the sulphurated-hydrogen springs derive their sulphur from these sulphides, this combining with the hydrogen.

More probably, however, the metals were in solution as sulphates, many of which are easily soluble. These coming in contact with organic matter (so common in nature), were then reduced to sulphides. Such reactions are occurring all the time under our eyes.

Application to California Veins.

A study of the veins of California and of the hot springs of this State and Nevada, has done much to put this theory on a solid foundation. Thus, the fact that gold, the most insoluble of all metals, is dissolved only in free chlorine, which doesn't exist in nature, has been the great stumbling block hitherto to the theory of solution. But the explanation of this can be found by examining the deposits on our coast.

The gold mines of California (and all gold mines) are of two kinds—quartz and placer. The first are on true auriferous veins, where the vein-stuff is invariably and almost entirely quartz. The minerals contained are sulphides of iron, lead, zinc and copper, and perhaps quicksilver. The most common is sulphide of iron, and the gold occurs always in connection with iron pyrites.

We have previously seen the evidences of our vein stone:—the ribbon-structure and the fluid cavities filled at 180° of temperature, and up as high as 350°. Now we must consider the metallic contents. As the metallic sulphides are enclosed in the vein-stuff, we must believe that these were deposited in the same manner as the gangue.

If we take sulphide of iron, gold-bearing pyrites, and dissolve it in nitric acid, we find the gold left untouched in the original state, and as little threads and crystals. It was then deposited from a solution. Now, in an ordinary quartz vein, the effect produced by us with the acid, has been produced by the meteoric agencies of nature, and the gold is found at the surface in the same shape. The quartz vein is denuded and the placer mines are formed, in which we find rounded blocks and boulders and rounded nuggets as evidences thereof.

We have two kinds of placers:—the deep and the superficial. The deep placers were formed in the beds of ancient rivers, as they existed many years ago. Then streams of lava poured down from the Sierras, and these naturally flowed into and along the river channels, covering the gold deposits and dispossessing the waters of their beds. The waters were forced to run elsewhere, and formed what are the present superficial deposits.

The accompanying diagram, Fig. III, shows an ideal section of land thus changed. The old river channels were at *a*, and the original contour of the land is denoted by the dotted lines. The gold deposits were formed at the deeper part of the channels, as shown by the black places. These were then covered with lava, and the rivers, forced elsewhere, gradually wore down the land and formed their present channels, *b*, often many hundreds of feet below their old ones; and so the deep placers are now often higher up than the superficial ones. These changes have occurred in the most recent geological times, possibly since man lived on the earth. Having exhausted our superficial placers, we are now commencing to work the deep ones to a considerable extent.

We find in the deep placers certain phenomena

na which advance our theory. We frequently find gravels cemented with silica, and we find also wood silicified. These circumstances were induced by soluble silicates, and point to alkaline waters.

Again, we find often gravels cemented with iron pyrites, and wood petrified with this material. Waters, holding sulphate of iron in solution, percolated through the drifts, and meeting the wood or other organic matter, deposited sulphide of iron.

If we dissolve this sulphide of iron in nitric acid, we find the contained gold sometimes in the form of rounded granules. In this case, it was washed here, and then the sulphide formed around it. But we also find it as fine threads and crystals, as in veins, and therefore it was deposited from the same solution as the enclosing sulphide.

We are thus almost driven to the conclusion that the solvent was a solution of sulphate of iron. We enquire then—will this dissolve gold? We must remember in this connection the difference between the operations of the chemist and those of nature. The chemist calls a substance insoluble, if it is not dissolved to any considerable extent in a limited space of time. But nature has the infinite ages of geological time to work in. Hence, a substance dissolved only in very small part by the chemist, may be entirely dissolved by nature. Now, gold is soluble to a limited extent in solutions of salts of iron, mostly in chloride of iron, but to a smaller degree in the sulphate.

The action then is this: The alkaline and percolating waters dissolve the quartz, which is afterwards deposited in its present position. The sulphate of iron held in the waters dissolves the gold, and when organic matter is met, the sulphate is reduced to sulphide and, as such, is deposited with the gold.

A Present Example in Nevada.

This whole process is now going on, and we have a good example of it in the well-known "Steamboat Springs" of Washoe county, Nevada. Here, through fissures, some being 2,000 feet long, boiling alkaline waters issue from the earth. These waters, holding carbonate of soda, contain in solution silica which is deposited all around. The process of vein formation is

going on here, and we can trace every stage of gradation. Some of the fissures are merely lined on each side with the deposits, some are nearly closed the same way, and some are quite filled (no further water issuing from them consequently) and are just like our known mineral veins.

Here too are found iron sulphide and other metallic sulphides just as in a quartz vein, and it has been stated by a man of considerable scientific attainments, Mr. Lancer, that he has found gold in the pyrites here. This lacks further confirmation, but is still worthy of attention.

Some may ask, in this connection, where the iron sulphate comes from. We cannot go back to the origin of everything. We can only say that the sulphate comes from the sulphide and the sulphide from the sulphate, under oxidizing and reducing agencies.

And where does the alkali come from? From the soda granite of the Sierras. The soda granite is that granite which contains soda felspar. Soda granite is easily decomposed. In decomposition, the soda is changed to carbonate of soda, of which we have had so much to say. The waters leach out the soda carbonate (in small quantities at a time) and (for example) run into a lake. Many lakes, as Mono and Owens, having no outlet, their waters are concentrated by evaporation. The distilled water falls again on the granite, takes up more alkali and runs into the lake again, and in this way we in time get bodies of strong alkaline water.

There was a time when California was more volcanic than it is now; when hot springs, carbonate alkali springs, were almost everywhere; and thus the vein formation could have been carried on to a large extent, just as we see it done now in the present example.

The lecturer believed that this idea was the foundation of the true theory of the formation of veins. It may be, probably will be, modified and perfected as our knowledge increases, but the essential portion will remain.

Prof. LeConte closed his lecture with some eloquent remarks on true theorizing—the seeking for truth, which, however theoretical, is always practical. The application to practice, to be sure, does not always immediately follow the discovery of a law. One noted instance of long delay in the application is given by the case of the ancient mathematician, Apollonius, who, some 200 years before Christ, spent his life in studying the laws of the curves produced by cutting a cone in various directions. A man who should do such a thing now would be in danger of being sent to Stockton. Yet, after 1,800 years, the whole of our astronomy has come from these very studies. But in our present advanced state, the practical application follows fast on the discovery of the rule.

The professor concluded amid the hearty applause of his audience. This is the last of his series which has proved so attractive and instructive. The next lecture will be delivered by Prof. John Le Conte on the Vaporization and Elastic Force of Steam.

Our California Type.

In parting, at the close of our last volume, with our old typographical "dress," and issuing our papers in new type it is with pleasure that we can say a good word for the old font which served our use for four years, and received the praise of many readers for its plain, durable and easily read face. Cast by Messrs. Faulkner & Son, in 1866, it was the first font issued of California made type, and has worn better than any other body type we have ever used in a long period of printing and publishing experience.

Since the establishment of the above-named type-foundry on this coast, the business has increased very rapidly, until there are now three firms and about 100 persons employed in the business of making and furnishing type and printing materials in this city. The first and largest of these is the California Type Foundry Company, of which Mr. Geo. L. Faulkner is agent. This company has recently removed their salesroom and manufactory to more spacious and convenient apartments on the first and third floors of Nos. 405 and 407, Sansome street. Dealing with Mr. Faulkner since 1859, we will say, for the benefit of others of our fraternity, that we have ever found him both reliable and liberal. Lately, no less than four important inventions connected with type making and composing have been invented in this city, some of which will doubtless be introduced throughout the civilized world. Our type-founders and electrotypers number some of the most expert and experienced craftsmen in the United States, and there are but three or four cities in the Union where the business is so large and enterprisingly conducted.

NEW POST OFFICES have been established at Mono, San Luis Obispo county; Bell's Bridge, Shasta county; Munckton, Mono county; Felton, Santa Cruz county (special); Rumburgh, Siskiyou county (special); Ballard's, Santa Barbara county; Pleito, Monterey county; Potter Valley, Mendocino county; Ceres, Stanislaus county. The post office at Diamond Mountain, Nevada, has been discontinued, as no logner needed.

Mining During 1870.

A review of what has been done in mining during the past year and a consideration of the present prospects of this industry present a much pleasanter picture than was afforded a year ago. We have passed through hard times, have been terribly crippled by want of capital and confidence; yet these very troubles have been attended with beneficial results in many respects, and now that mining has passed successfully through the ordeal, it is again coming into popular favor and gaining the position which it deserves.

During the year many new discoveries have been made, and old workings have been successfully opened. Colorado has found new riches in Grand Island district and elsewhere, has gone more rationally to work in the treatment of her rebellious ores, has improved her mills, added smelting works, and utilized more fully her coal deposits. Montana has had her Cedar Creek, and Idaho her Snake River excitements, while many mines have been taken in hand, after lying idle, and made to pay. Utah has been surprising the country with her lead mines at the Cottowood cañons. Arizona has opened and re-opened a number of districts. From Eastern Oregon we have had reports of good workings in several localities. The coal mines along the Pacific Railroad have been developed. Nevada has been unusually fortunate. Austin and the Reese River country, so long at the lowest ebb, have revived. Humboldt, Esmeralda and numerous other localities are again coming up. The operations on Treasure Hill promise much for White Pine. The Meadow Valley mine, Ely District, has been yielding among the best. Yellow Pine and Clark districts are attracting attention. Mineral Hill and Eureka are doing splendidly. We might mention a dozen other places, in various states and territories, but our excuse—crowded columns—must again be given. We must refer to the series of interesting letters from W. H. M., written from Nevada, Utah, Idaho and Montana, and to our mining summary, which, compiled with the greatest care and fidelity in all cases has kept track of the important operations. Our neighbors up in British Columbia seem to have improved prospects to some extent; although the Peace River excitement appears to have proved a failure, yet, on the other hand, the Cariboo mines have good chances. So down in Mexico we hear of rich strikes, the latest being that at Chihuahua.

A number of important sales of mines have been effected to European capitalists. The Terrible and Equator, in Colorado, the Eberhardt and Aurora, in Nevada, the North Star and Sierra Buttes, in this state, were among the first and more important mines transferred to English companies. English capital commenced coming to us at a very dull period, and seemed to be an entering wedge which rendered the flow of capital much easier. At least since that time, money has been more plentiful for working mines.

Our deep placers in California are now beginning to yield up their treasures. Their extent and value have been slighted heretofore by people generally. But at Smartsville, Manzanita Hill, North Bloomfield, Grass Valley, etc., etc., operations are going on, or have been prepared for, which promise the most glowing returns. In this connection, we may be allowed to call attention to the letters of our correspondent, L. P. Mc., from the mountain counties, which give very many interesting facts. A party of the Geological Survey has been at work on the ancient river channels during the summer, and the result of their examinations will be of the most important and interesting character.

Smelting operations are carried on extensively, and are giving large returns. The Utah mines and those at Eureka deserve special mention here. Better furna-

ces are being built, and smelters are rapidly learning the best methods of treatment. The Eureka furnaces are said to produce 25 tons of bullion daily, although we are not informed certainly as to the exact figures. We cannot omit mention of the Inyo county operations, where smelting has been successfully carried on.

We gave some statistics last week of the ore and bullion shipments to this city. Since then we have obtained the amounts of ore shipped East on the Union Pacific Railroad during 1870. We cannot give a better idea, perhaps, of the growing production of our interior mines, than by stating these amounts; and we add those shipped over the Central Pacific for the same time. The bullion shipments, we are sorry to say, we have not received, and this important item we must therefore omit. It was 1,681 tons, 700 lbs. over the C. P. R. to this city.

	1870	Union Pacific.	Central Pacific.
January.....	3,441 tons.	170 tons.

Totals.....9,633 tons.....4,537 tons.
Grand total.....14,170 tons.
Besides the December shipments over the U. P. R. R.

The improvements in mining appliances have been great. For hydraulic mining, the improved hose and nozzles have enabled the miners to work with greater pressure and larger streams, thus effecting a remarkable economy. In place of, say, 250 inches of water with heads of from 100 to 150 feet, 1,200 inches of water with a head of 300 feet can now be thrown against a bank in a single stream. One man can now do the work of a dozen, and the rock thrown down is very much larger in amount. The expenses being thus reduced, poorer ground can be made to pay. Craig, Fisher, Harris, Watson and Hoskins have all patented devices, some of which are extensively used, and to which hydraulic mining owes much.

Three drilling machines have been brought out and tried here during the year, all of which have been described in the Press. The first was the Burleigh, a percussion drill, which has been at work in Colorado, and which has since been reported on most favorably in England and elsewhere. Severance and Holt's Diamond Drill, has been illustrated in our paper, and has accomplished wonderful results. For prospecting, it is in advance of any other. The third machine is that of Dr. Blatchly, a percussion drill, very simple, light, compact and cheap, which has done excellent work under our eyes. Dr. Blatchly has been engaged in making additions and alterations for years. Its feeding arrangement seems to act exceedingly well. One other point is especially worthy of mention. A great trouble in percussion drills is the jar resulting from the blow on the rock. Dr. B's drill is free at the moment of striking, its rear end is not in contact with any part of the machine, while there rebound, usually so destructive to the parts, is actually utilized here.

The agents for blasting have been improved. Giant Powder is being more extensively used, and this or some similar compound must be employed in very many operations.

In milling several improvements have been made. Our quartzmills are certainly not surpassed, probably not equalled, by any elsewhere. But yet the millmen can make some improvements. Thus there is considerable latitude in the rapidity of the blows, the size of the screens, etc. In cement mills, for instance, the substitution of quarter-inch for eighth-inch screens, have been found, we are told, to increase the capacity 25 per cent. without reduction in the yield. The Wilson mill has done exceedingly well in the Julian District and elsewhere. In concentrating appliances, we have still a large field open. Several new biddles have been described by us; as have also several pans, which are said to give better results than usual.

Of electricity and electrical methods we have been a little shy. But we think it would be highly unfair to omit mention of any process which gives good results, whatever the method used, or whatever our ideas may be. We have had letters from Montana and elsewhere which give figures to prove that Paul's electric process has been

tried thoroughly and has worked most successfully ores of a very rebellious nature, which had hitherto proved intractable under other methods.

In furnaces much has been done. The Stetefeldt furnace has been introduced into a number of places, and for working large amounts, is the most successful one we know of. For small amounts, the Bruckner cylinder gives good results, according to reports from Colorado. Improved smelting furnaces are to be seen at Eureka.

Transportation matters are so closely connected with mining, that we must refer to the extension of roads throughout our coast, leaving the particulars to appear in another issue. The introduction of narrow gauge roads seems to be a necessity here, and we rejoice at the steps already taken in the matter. The wire tramways at White Pine and in Colorado also deserve mention.

So much for a general, but brief review. With a better feeling with regard to laborer and employer, a better character of the operations, cheaper methods, and improved apparatus, and with huge amounts of precious metal yet to be extracted, our mining interests have the brightest prospects.

IMPORTANT MINING DECISION.—Last month a mining decision of considerable importance was pronounced in the Supreme Court, at White Pine, Nevada, in the case of Samuel Leet *et al.* versus the John Dare Mining Company, with regard to right of possession of certain mining grounds. It appears that the Dare Co., on June 8th, 1868, located a mine of 1,200 feet (six locators of 200 feet each), and within 40 days did two days' work on the entire claim. On Feb. 18th, 1869, Leet & Co. located 800 feet of the same claim, and within 40 days did at least two days' work for each 200 feet—claiming that the ground was open to re-location, because the former company did not do two days' work for each 200 feet. In a suit before the District Court, decision was pronounced in favor of the Dare Co., which decision is now reversed by the Supreme Court, Judges Johnson and Whitman.

A SHERIFF'S SALE AT WHITE PINE.—The White Pine News, of January 4th says: The White Pine Smelting Works were sold at sheriff's sale yesterday afternoon for the large sum of \$2,000, or \$1,500 for the personal property, and \$500 for the real estate. There were about 20 persons at the sale and only one of them made a bid. We have no doubt that if this sale had been properly advertised in the White Pine News, that moneyed people would have been there, and that the works might have been sold for what they really are worth. The idea of selling a 30-horse power engine, boiler, two smelting furnaces, assay apparatus, houses, etc., for \$1,500, is a little too steep to be passed by without comment.

THE STOCKTON AND COPPEROPOLIS Railroad Company has mortgaged the road to Milton S. Latham and Saxon D. Atherton for \$1,000,000. Track is being laid at the rate of half a mile per day. Negroes, but no Chinese are employed in its construction. —*Alpine Chronicle.*

BOUND EAST.—We commence this week a series of letters from our agent, W. H. M., who has started on a tour East. His first communication treats of the country on the line of the Union Pacific Railroad, of which road more will appear in our next.

THE CORN HUSKING GLOVES, illustrated to-day, can be seen at Weister & Co.'s, No. 17, New Montgomery st., San Francisco, under Grand Hotel. W. & Co. have also a large number of other useful novelties on hand now.

BET SUGAR AGENCY.—We would state that the samples of California beet sugar, mentioned by us last week, came from Messrs. Perkins & Flint, corner of Greenwich and Battery sts., general agents for the Alvarado manufacturing company. We believe the Company has been fortunate in the selection of their agency for this important and meritorious product.

An ocean cable, from New York to Liverpool direct, is now proposed. Possibly may be laid by next July.

Chromos.

The engraving which we print on this page is from the celebrated chromo-lithograph of Hill's Yosemite, a scene which has been painted at by every artist who has ever visited this coast and become familiar with the subject, either by visiting the valley or by the aid of the numberless photographic views from time to time brought out. But of all who have attempted the difficult task of reproducing in colors on canvas a general view of the valley (we believe this is conceded by every one conversant with art matters) no one has yet produced a picture of this beautiful scene which excels the one referred to. The best proof of this is the fact that the painting sold for a large price to a representative Californian, who is thoroughly conversant with the scene Mr. Hill essayed to portray.

It is true that many good, and some very fine, works of art have been produced, founded on the much-hackneyed Yosemite; but they were generally like the stories "founded on fact,"—a resemblance, but one rather difficult to trace. Now we need something more than a resemblance. Scant meed of praise would our Eastern friends award an artist of the present day who should paint Niagara Falls in any other manner than as the scene actually exists. To make a pretty picture, by taking liberties with nature and allowing the pencil to roam over the canvas wherever fancy dictates, is one thing; to portray nature upon canvas is quite another matter. The last only is true art.

Much has been written of late about chromo-lithography. Many suppose it to be an American invention and comparatively new. This is not so. The process has been in use nearly a century, and was first discovered in Munich, Germany. A knowledge of chromo-lithography would convince any one that it could not well have been invented in any other locality, seeing that all lithography is done upon a peculiar kind of stone found only in Bavaria in the neighborhood of Munich. Watt would have stood a poor chance indeed to have been the inventor of steam had he lived in a country where fire was unknown.

The advance of chromo-lithography, however, goes to show that not so much results from the invention as from adapting to the popular demand or taste. This last is what Mr. L. Prang, of Boston, has done. Facsimiles of paintings by this process are of no recent date; but the bringing out of popular subjects, executed in a superior manner, from the finest paintings, has made the United States not the cradle but the drawing-room of the art. In a future number we propose giving some reasons why we excel Europeans in this branch; and we shall from time to time print engravings from the most popular American chromos.

The chromo of Hill's Yosemite has met with good success on this coast, and all attempts to equal it have so far failed. It is the only chromo published by Prang which has been exclusively a subscription picture.

We have often heard laments that we have no public art gallery in this city. What public spirit has failed to produce, is supplied, however, to a great extent by private enterprise. There is a good collection, where one can profitably cultivate the finer sensibilities, at the establishment of Messrs. Snow & Roos (Goupil's depot), 21 Kearny-street. These gentlemen are the agents of Mr. Prang for this coast, and at their place, besides other artistic efforts, the choice productions of Prang & Co. can be seen. Those living at a distance can

benefit by the institution by sending for the catalogues and price lists, which are furnished free on application, together with engravings of some of the most popular chromos.

In regard to the engraving, a few words concerning the principal points indicated may be acceptable to those to whom the features of the place are not familiar. On the left hand, or north side, is El Capitan, or Tutucanula as the Indians call it, which rises up from the valley to a height of 3,600 feet. On the right hand are the cliffs on the face of which is seen the Bridal Veil Fall, about 1,000 feet in height. Behind this is a part of the Cathedral Rock, which rises up 3,000 feet. Further back, about the center of this picture, is

YOSEMITE VALLEY.

Sentinel Rock, with its obelisk, itself 1,000 feet high, rising up to over 3,000 feet above the level of the valley. Then comes the Half Dome, a crest of granite 4,737 feet high, and with the face toward Tenaya Creek absolutely vertical for 2,000 feet down from the summit; while in the background is seen North Dome, 3,568 feet in elevation above the valley. Add to these figures the elevation of the valley itself, 4,060 feet above the sea, and we get some respectably high figures.

Giant Powder Experiments.

The Giant Powder Company, of this city, instituted last Saturday several very interesting experiments at their works (on the Treat Tract, on the Central Road) at which a number of prominent citizens, gentlemen interested in mining and members of the press were present. The object was to show clearly that the article they manufacture is greatly superior and absolutely much cheaper for blasting and like purposes than common powder, and that its use is unattended with danger when ordinary care is exercised.

To prove the first point, comparative tests were made of the force of each article in projecting shot from a mortar. The mortar was elevated 45 degrees, and a 32-lb. cylindrical shot was fired by charges of blasting powder and of giant powder. Of this last the company manufacture two kinds:—"No. 1," the ordinary kind, according to Nobel's patent; and "No. 2," a weaker compound, (whose ingredients are not given) the property of the company, much cheaper than No. 1, and intended for use in certain kinds of rock where an excess of power is not required. No. 1. costs \$1 per pound, and No. 2, 50 cents.

In these experiments the charges were 8 grammes of each powder. The blasting powder threw the ball 17½ feet (mean of two experiments); No 2 giant powder, 410 feet; and No. 1 giant powder, 545 feet.

Next, the shot (now a 32-lb ball) was thrown vertically in the air from a mortar, whose bore was of sufficient dimensions

and shape to hold only the lower half of the shot, around which a loose packing of sand was poured. The charges were now 30 grammes,—about one ounce. The accompanying diagram will make the arrangement easily understood. A is the mortar, of cast-iron; B, a wrought-iron band, 1x4 inches; C, the chamber holding the charge; D, the ball; E, the fuse; F, the loose sand packing. The blasting powder merely blew out the packing; No. 2 threw the ball about 486 feet, and No. 1, about 788 feet up in the air. The time was taken by several gentlemen. The No. 1 charge also burst the band, B, around the mortar.

The horizontal fire gave, as the comparative projecting force of the mixtures, the proportion of 1 to 23½ to 30 ½. From the

vertical fire we can make no proportion, as the common powder did not even lift the ball out of the mortar. The distances to which the ball was thrown by No. 1 and No. 2 were as 1 to 1.6. These experiments show how much more powerful is the giant powder, and hence that, other things being equal, from the much greater work done, it must be a more economical agent. It seems to us that it must come into very extensive use, if the matter of attendant danger can be settled satisfactorily. The next experiment was to show that the powder cannot be exploded by fire, and that ordinary care will obviate all danger. The company claim that, in all the accidents known to them, the cause has always been simply carelessness, and never properly attributable to the powder.

A five-pound box of the giant powder, out of which about half a pound had been taken and exploded by fuse on a log, which it shattered to splinters, (this being done merely to satisfy all that the contents of the box actually were giant powder) was closed up, as when prepared for transportation, and placed in a fire of brush and twigs. When the box had been burned through, the powder caught fire and burned, like fire in pyrotechnic displays, without explosion. This proved conclusively that simple heat will not explode the mixture.

With the properties of nitro-glycerine, no one is yet fully acquainted. Yet the composure with which the officers of the company stirred up the fire in the last experiment, showed that they had not the slightest fear of danger from burning the giant powder (which they would perhaps term nitro-glycerine rendered harmless) and the result justified their confidence. In regard to accidents at factories, Mr. Bandmann said that the majority occurred by a desire to economize by saving the sulphuric acid, which after being used, is washed out from the manufactured nitro-glycerine. This is very apt to retain some of the nitro-glycerine, and hence the accidents. On this account, this company does not use further the acid which has been once employed. The nitro-glycerine once mixed with the other ingredients to form giant powder, no further danger is feared. A proper degree of caution, however, is never superfluous.

DIALOGITE, first found in this country in the works of the Schenectady-Tarshish mine, has made its appearance in the face of the Silver Glance tunnel this week, and some very pretty specimens taken out.—*Alpine Miner*, Dec. 17.

PATENTS & INVENTIONS.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s Scientific Press American and Foreign Patent Agency, the following are worthy of mention:

APPARATUS FOR COLLECTING PRECIOUS METALS.—J. M. McDougall, S. F. This is an improvement on the apparatus patented some three years ago by Mr. McDougall, which we have heard praised as most efficient in saving gold even after the ore had passed through the most approved gold-saving apparatus. This former invention, it may be well to state, consisted in using metallic standards placed in an ordinary

sluice, the bottom of which had been previously covered with amalgamated plates. The standards were, according to the patent, composed of copper and iron, by the combination of which metals a retaining amalgamating surface was presented and an electrical action induced, which would serve to collect and precipitate even the finest particles of gold or other metals. The present invention relates to an improved method of securing the copper in the (hollow iron) standards in firm contact with the iron; to the employment in the sluice of any square obstructions in place of the metallic standards, said obstructions being placed in a similar manner to that employed with the metallic standards, in order to impart to the water a rocking motion, by which the particles of metal are precipitated without the electrical influence; and lastly to coating the plates on the bottom of the sluice with gold or silver amalgam or the amalgam of some of the base metals, in order to give a heavier body of quicksilver with less fluidity. Mr.

McDougall has spent a long time in working and improving his apparatus, and has been very successful in his endeavors, if common report is to be credited.

DEVICE FOR EXHIBITING PHOTOGRAPHIC PICTURES.—A. G. Walton, S. F. This device is an excellent substitute for parlor albums, for it contains in a small space a large number of pictures, which are, moreover, protected, while they can be examined at pleasure. It consists of a small box in which the pictures or cards, after having been placed in suitable frames, are arranged horizontally in a pile, one above another. Two wheels, placed one at each end of the pile and driven from the same shaft, are provided with pins which, as the wheels revolve, take the cards or frames in succession from the bottom of the pile and carry them up to the glass window through which the pictures are viewed. After carrying them past this point, they drop them with their opposite faces downward upon the top of the pile, and thus, after the whole number of cards have been passed around and inspected on one side, they are again carried around in a similar manner with the opposite side to the front. In this way, each card having a picture on each side, two views are given for each frame in a most simple and ingenious manner. The device can be used with advantage also for exhibiting advertising cards.

MEDICAL COMPOUND.—A. J. Jenkins, Virginia City, Nev. This is a preparation which is said to be most effectual as a cure for rheumatism, and which, if substantiating this claim, must prove a great benefit to the very large army of rheumatic sufferers.

WORTH READING.—We call attention to the report, on another page, of Professor Joseph Le Conte's lecture on the theory of mineral veins. Prof. Le Conte treats of the subject in a most instructive and interesting manner, and his great ability gives of itself much weight to his propositions, which he, moreover, sustains by strong evidence. Prof. Le Conte has now concluded his series before the Mechanic Arts College, and will be succeeded by his brother. These lectures have been well attended, and there are many names now on the list for the first vacancies.

The kind letter from Mr. Almarin B. Paul, containing observations on our mining interests, is also worthy of perusal.

HOUSEHOLD READING.

High Heeled Shoes and Flat Feet.

Much, but not half enough is being said with regard to the high and small heeled shoes so generally worn by the ladies at the present time. A persistent use of such heels will destroy the beauty of the best formed foot, besides producing other physiological deformities and injuries.

A high heeled shoe, with the slender point usually given to it, cannot properly support the arch of the foot; but allows it to sink, whereby the bones and ligaments become stretched, weakened and displaced, and the foot becomes flattened and more elongated—in other words the person becomes flat-footed, and loses the elasticity and strength of step, and grace of motion which nature designed in the construction of the arch. People with high arched feet walk easier, more graceful and with much less fatigue than those with flat feet. A depression of the natural arch of the foot will often increase its length from a half to three quarters of an inch.

High heeled shoes weaken the ankles and place them in a condition to be easily "turned"—sprained, with the slightest misstep. The injuries sustained from their use, will be permanent, and productive of very disagreeable consequences in after life, not the least of which will be a premature tottering of age. There is neither beauty, nor comeliness nor comfort in the fashion, the effects of which are already plainly seen in the altered gait of many ladies which we meet upon the streets of this city. The natural elasticity of step is fast giving way to the tottering gait, so conspicuous in Chinese females. The heel, as usually worn, is at least twice as high as it should be, and the surface of the same not more than half what is required to give a steady and firm support to the person.

The Japanese and some of the Chinese, who follow a similar fashion in the manufacture of their shoe heels, have at least sense enough to make the heels broad, so as to give a comparatively firm tread, and prevent the straining and weakening effect produced upon the ankles by the "pointed" heels which seem to be so attractive to our American ladies.

LIVER AS FOOD.—We cannot too strongly denounce the use of liver and kidneys as food for man. These organs are constantly charged with the worn out, excrementitious matters of the system, the presence of which, when rightly understood, are disgustingly offensive to the taste. Their presence is evinced by the fact that these portions of an animal are always the parts first subject to decomposition. They make very good food for hens and dogs; but for man—never!

HOW TO REMOVE HAIR FROM THE PERSON.—A correspondent asks the *Herald of Health* how hair can be removed permanently, and remarks, "I have been told to pull it out; but it grows in about as fast as I pull it out." The *Herald* answers as follows: "The least injurious way is to continue pulling it out, until the glands about the root become so weakened as to be unable to replenish it. Two or three times pulling it out will be sufficient with some, while others may have to repeat it half a dozen times or more."

HUSBANDS ought to "keep out of the kitchen." A husband who did not, writes thus of the consequences: "I found fault, some time ago, with Maria Ann's custard pie, and tried to tell her how my mother made pie. Maria made the pie after my recipe. It lasted longer than any other pie we ever had. Maria set it on the table every day for dinner, and you see I could not eat it because I forgot to tell her to put in any eggs or shortening. I was economical, but in a fit of generosity I stole it from the pantry and gave it to a little boy in the neighborhood. The boy's funeral was largely attended by his former playmates. I did not go myself."—*Western Home*.

Buckwheat Cakes—Are they Wholesome?

It is very common to class buckwheat cakes, in reference to digestibility, with "flannel cakes," which are made of wheat flour; but they differ materially. There is an instinct that gives relish to buckwheat in cold weather, which is explained by the fact that that description of flour gives out more heat to the body, while wheat gives more nutriment and less heat. The stomach will bear a greater quantity of buckwheat, for it is lighter and spongy, and the gastric juice readily permeates the pulpy mass and gives it easy digestion. It cannot assume the doughy toughness that makes wheaten cakes so hard to digest. To mix wheat-flour with buckwheat, is to take away the best properties of buckwheat cakes. No other cake can be eaten hot from the griddle without injurious effects akin to those of hot bread. While buckwheat cakes are undoubtedly wholesome, their deficiency of gluten requires that we do not make our meals exclusively of them.

In California we produce buckwheat of superior quality, and on Sherman Island, for instance, three crops a year can be grown. Now this meal is peculiarly suitable to the people of the Bay district, at all seasons. Heat-making food is never objectionable in that locality, and we eat meat enough to supply all the strength we need. Buckwheat cakes, not alloyed with wheat-flour, are therefore healthful here, and in all cool climates, at all seasons, when taken in moderation.

POISONED TARLATAN.—A lady in Berlin bought six yards of green tarlatan for a ball dress for her daughter. The mother, who assisted in making the dress, and the daughter who wore it, at the same time fell dangerously sick and had a narrow escape from death. The medical adviser of the family at once discovered poisoning by arsenic. The green dress was chemically analyzed, and it was found that the coloring contained thirteen per cent. of arsenic. The merchant was summoned before the criminal court; but he was acquitted, for the reason that he could prove he had advised the purchasers of the poisonous quality of the color used to tint the tarlatan.

CURING MEAT.—At this season of the year the thoughts of almost every farmer naturally turn more or less to the processes of curing meat for the winter's use. Most farmers have a pig or two to salt down, and some have mutton or beef, and the quality of the meat which is to furnish food for the family, will depend a good deal on the way in which it is cured. There are various modes of curing meat, but one of the best, perhaps, is that suggested by the *Germantown Telegraph*, which is as follows:

To one gallon of water, take one and a half pounds of salt, half a pound of sugar, half an ounce of saltpetre, half an ounce of potash. In this ratio the pickle to be increased to any quantity desired. Let these be boiled together until all the dirt from the sugar rises to the top and is skimmed off. Then throw it into a tub to cool, and when cold, pour it over your beef or pork, to remain the usual time, say four or five weeks. The meat must be well covered with pickle, and should not be put down for at least two days after killing, during which time it should be slightly sprinkled with powdered saltpetre, which removes all the surface blood, etc., leaving the meat fresh and clean. Some omit boiling the pickle, and find it to answer well; though the operation of boiling purifies the pickle by throwing off the dirt always to be found in salt and sugar.

If this receipt is properly tried it will never be abandoned. There is none that surpass it, if so good.

HOW TO CURE A COLD.—The *Herald of Health* says:—Upon the first indication that you have taken a cold. Stop eating until the cold is eased; drink freely of cold water; induce a free perspiration over the whole body, either by exercise, vapor or hot water bath, or by going to bed and covering up warm; breathe all the pure air you can. In most cases a cold will yield to this treatment in 12 hours, or at most in 24.

Household Receipts.

HOW TO COOK DRIED BEEF.—Place the beef, nicely shaved off, in a frying-pan, with butter enough to fry it; let it fry until a little browned, then sprinkle in dry flour, as much as you would take were you going to mix it with water; let it brown but take great care not to burn it. When browned sufficiently, add cream or milk enough to make a gravy; let it boil a few moments, add a little butter and pepper and it is done.

Some very frequently boil eggs and cut them up lengthwise, and lay them around on the meat after it is poured on the platter. This makes a very pretty and palatable dish, and with some nice mashed potato, and sweet potatoes and tomatoes with sugar, and just a trifle of vinegar poured over them, supplies a very good breakfast.

Another way to cook dried beef is to cut up a sausage in slices and fry until there is enough fat tried out to fry the meat; then put in the beef, and proceed just as for frying in butter, using water instead of milk or cream for the gravy. This gives an excellent flavor unless sausage is disliked.

TO MAKE SAUSAGES.—Thirty pounds of chopped meat; eight ounces salt; two and one-fourth ounces pepper; two teacups of sweet marjoram. Pass the two last through a fine sieve. If you prefer it, thyme and summer savory may be substituted for the latter.

SODA BISCUITS.—One pound of flour, two tea-spoonfuls of cream of tartar into the flour dry; dissolve the soda in a little milk; wet the whole with milk, making it sufficiently stiff to mould into biscuits.

INDIAN CAKE.—One cup Indian meal with one pint of milk, two eggs; one table-spoonful sugar, a piece of butter the size of a walnut, half a tea-spoonful of soda. Bake half an hour.

CREAM PIE.—One cup sugar, one egg, piece of butter size of an egg, one tea-spoon soda dissolved in a cup of sweet milk; add to this, when mixed together, two tea-spoons cream tartar rubbed in three cups of flour, and bake in three jelly cake tins.

The Cream for the inside of the Pie.—One one-half cups milk; when boiling add seven tea-spoons cornstarch, wet with cold milk; let it scald a moment, then add two well beaten eggs; sweeten to taste, and flavor with lemon or vanilla.

Split the cakes when cold, spread them with the cream, and put together again like jelly cake.

A PINK-COLORED PANCAKE.—Boil a large beet root tender, and beat it fine in a marble mortar, then add the yolk of four eggs, two spoonfuls of flour, and three spoonfuls of good cream, sweeten it for your taste; grate in half a nutmeg and put in a glass of brandy; beat them all together half an hour; fry them in butter, and garnish them with green sweetmeats, preserved apricots, or green sprigs of myrtle. It is a pretty corner dish for either dinner or supper.

Mechanical Hints.

TO FIX DRAWINGS AND DESIGNS.—It may be useful to designers and others to know that pencil and chalk drawings can be set by washing them over with water in which isinglass or any colorless size has been dissolved; it may be necessary, after the first coat is dry to go over it with a second coat. When this wash is perfectly dry, the work may be varnished with one or two coats of a white spirit varnish, or what is perhaps preferable, a varnish of equal parts of Canada balsam and spirits of turpentine; this last varnish will produce a beautiful gloss and possesses the advantage of being able to stand washing with soap and water. It will be found necessary to apply the isinglass solution very gently, and not go over any part a second time until the first coat shall be perfectly dry, otherwise the lines of the work may be disturbed. It is also necessary to keep the work from the dust, or particles may adhere to the lines and mar the beauty of the work; care must be taken to have the brushes perfectly clean.

HOW TO TREAT A BURNING CHIMNEY.—**SALT FOR EXTINGUISHING FIRE.**—If it is desired to extinguish the fire in a chimney which has been lighted by a fire in the fireplace, shut all the doors of the apartment so as to prevent any current of air up the chimney, then throw a few handfuls of common fine salt upon the fire, which will immediately extinguish the same. The philosophy of this is, that in the process of burning the salt, muriatic acid gas is evolved, which is a prompt extinguisher of fire.

A SEA-WEED, belonging to the same genus as the Irish Moss found abundantly on the coast of France, is now used in that country for clarifying beer, as being much more economical, and better suited to the purpose than gelatin.

Life Thoughts.

Not to hear conscience is the way to silence it.

One hour to-day is worth two to-morrow.

You never lose by doing a good turn.

The beauty of holiness, like the sun, is seen by its own light.

Slander injures threefold—him that utters, him that is attacked, and him that hearkens.

Virtue shines, though contemptibly clad, and is recognized and respected by noble minds.

A man that hoards riches and enjoys them not is like an ass that carries gold and eats thistles.

There is no such thing as a menial office when you put a true man into it. A menial office is an office with a mean man in it; and it makes no difference whether it is a king's office or a scavenger's office.

Hope is the last thing that dies in a man, and although it may often deceive us in the journey of life, yet it conducts us along an easier and more pleasant path to our journey's end.

Cherish thy mother; brief, perchance, the time may be that she may claim the care she gave.

Depend upon yourself; riding upon the shoulders of another is dangerous and foolish. If you are not cast off into a disagreeable place, you may be let down in a very ugly manner, when you least expect it.

To be free from desire is money; to be free from the rage of perpetually buying something new is a certain revenue; to be content with what we possess constitutes the greatest and most certain of riches.

WHENEVER you buy or sell, let or hire, make a clean bargain, and never trust to "We shan't disagree about trifles."

CONVERSATION is the daughter of reasoning, the mother of knowledge, the breath of the soul, the commerce of hearts, the bond of friendship, the nourishment of content and the occupation of men of wit.

VALUE no man for his opinion, but esteem him according as his life corresponds with the rules of piety and justice. A man's actions, not his conceptions, render him valuable.

No cause has ever been noble enough wholly to enoble fight, for selfishness has always been one of the chief impelling forces.

The Industry of Interest.

No blister, says Beecher, draws sharper than interest does. Of all industries none is comparable to that of interest. It works all day and night, in fair weather and foul. It has no sound in its footsteps, but travels fast. It gnaws at a man's substance with invisible teeth. It binds industry with its film, as a fly is bound in a spider's web. Debts roll a man over and over, binding hand and foot, and letting him hang upon the fatal mesh until long-legged interest devours him. There is but one thing on a farm like it, and that is the Canada thistle, which swarms new plants every time you break its roots, whose blossoms are prolific, and every flower the father of a million seeds. Every leaf is an awl, every branch a spear, and every plant like a platoon of bayonets, and a field of them like an armed host. The whole plant is a torment and vegetable curse. And yet a farmer had better make his bed of Canada thistles than to attempt to be at ease upon interest.

Be Social at Home.

BE SOCIAL AT HOME.—Let parents talk much and talk well at home. A father who is habitually silent in his own house, may be in many respects a wise man; but he is not wise in his silence. We sometimes see parents, who are the life of every company which they enter, dull, silent, uninteresting at home among the children. If they have not mental activity and mental stores sufficient for both, let them first provide for their own household. Ireland exports beef and wheat, and lives on potatoes; and they fare as poorly who reserve their social charms for companions abroad, and keep their dullness for home consumption. It is better to instruct children and make them happy at home, than it is to charm strangers or amuse friends. A silent home is a dull place for young people—a place from which they will escape if they can. They will talk or think of being "shut up" there; and the youth who does not love home is in danger.

Our Agents.

OUR FRIENDS can do much in aid of our paper and the cause of practical knowledge and science, by assisting Agents in their labors of canvassing, by lending their influence and encouraging favors. We intend to send none but worthy men.

Traveling Agents.

THE MASONIC MIRROR

Is the only Masonic Publication on the Pacific Coast. The Second Volume is published weekly, in the popular and beautiful form of a

QUARTO-MEDIUM SIXTEEN PAGE PAPER

AND IS A FIRST CLASS

Literary and Family Newspaper,

AS WELL AS THE

Organ of the Masonic Fraternity on the Pacific Coast.

ENDORSEMENT OF THE GRAND LODGE.

The following resolution was unanimously adopted by the M. W. Grand Lodge, F. & A. M., of the State of California, at its Annual Communication, October, 1870.

Whereas, in the opinion of this Grand Lodge, a well conducted Masonic Journal is of great benefit to the craft, in disseminating Masonic information among the fraternity, as well as furnishing a medium for general Masonic intelligence. Therefore,

Resolved, That this Grand Lodge, recognizing in the MASONIC MIRROR, edited by Brothers Amasa W. Bishop and Edwin A. Sherman, and published by the Masonic Publishing Company of San Francisco, a Masonic Journal of the character above set forth, do hereby recommend the said Masonic Mirror to the craft generally, as worthy of their most favorable consideration and support.

ENDORSEMENT OF THE GRAND CONSISTORY.

At the communication of the M. P. Grand Consistory, Ancient and Accepted Scottish Rite of Freemasonry in and for the State of California, held October, 1870 at San Francisco, the following resolution was unanimously adopted: Resolved, That the MASONIC MIRROR, published in this city be the official organ of this Grand Consistory.

TO ADVERTISERS.

The Mirror presents the best Advertising medium on the Pacific Coast, as it circulates in every town and hamlet, and among a class of citizens that it will be of advantage to advertisers to reach.

PATENTS BOUGHT AND SOLD ON COMMISSION.

Longshores Combination Tool.

town on the Pacific Coast to sell this valuable little

This device is just what its name indicates. As a KITCHEN Tool it is indispensable. It will fit and lift with perfect safety any Stove Lid, Frying Pan, Pie Pan, Pot, Kettle, or any other vessel or dish used about a stove. It is a complete tool for stretching carpets, driving tacks, pulling tacks, &c., &c. It answers the double purpose of hammer and pry bar, and is also a good Nut Cracker. It is made of the best malleable iron, and the Hammer, Pry bar and tack puller, are all hardened so as to stand the roughest usage. An Agent is wanted in every

P. Davis' Wire and Picket Fence.

Although about a hundred different styles of fences have been invented and patented in the United States within the past ten years, yet this Fence, for GENERAL FARM USE, stands at the head of the list. This is a Virginia invention, and the actual cost of the Fence complete in that State is less than fifty cents per rod. Three men can put up six hundred yards per day. You men who are idle, why hang about the city talking hard times when you can make from five to eight dollars per day building this Fence? We will make a present of ONE FARM RIGHT in each county on the Pacific coast to farmers who will erect one hundred rods of the fence in good style within thirty days after the privilege is granted. We wish to employ several working men to travel in this State and Oregon. Price of territory, and circular with full description of fence sent on application.

New Gas Light.

This Light takes the place of the Candle, the Kerosene Lamp and Coal Gas. Each Lamp is a perfect Gas Factory, making its own gas as fast as it is required. It is a safe, cheap and beautiful light. Circulars and full particulars sent on application. A few good traveling agents wanted to sell this and other valuable Patents.

Hay Press.

The best and cheapest hay press in the United States. Presses furnished at manufacturing cost to parties buying County or State Rights. The profits on a few Presses will pay for a county Right.

WIESTER & CO.,

One of our Parks.

Woodward's Gardens, one of the first places shown to travelers visiting our city, have been called by some the "Central Park of the Pacific." Whatever name may be given to these grounds, they certainly deserve and have received the highest praise and admiration, and we propose giving a brief description of their prominent points for the benefit of those of our readers who have not been able to visit them in person. We have several "breathing-holes" at present in our city, and hope at some time to have a large park; but exactly when, no one can say.

Mr. R. B. Woodward, one of the wealthiest and most liberal of our citizens, laid out these gardens in 1860 as private grounds around his residence. Possessed of a refined taste, and of adequate means to gratify this taste, he spared no expense in beautifying them. They are provided with choice plants, both foreign and native, a museum and several conservatories were built, and a trip to Europe was taken in 1861 by the proprietor with the special view of supplying these last. In selecting works of art, he was aided by Bierstadt and Virgil Williams, both of whom contributed to his Art Gallery. The garden statuary was produced by sculptors of Carrara Italy, expressly for Mr. Woodward.

As the various additions were made, and the gardens grew in beauty, their fame spread far and wide, and many came to see them. The beautiful plants and strange trees, the fine buildings with their novel architecture, the ponds and mossy rocks, the roar of the wild beasts, excited the curiosity of persons, to the most of whom the picket fence formed an impassible barrier. The proprietor was strongly urged to open his place to the public. There was a great need of some such public garden. It would serve to instruct the many to whom no opportunity was otherwise given of harmless and improving amusement. Mr. Woodward had always been most hospitable in allowing his friends free use of the grounds. He listened to the broader proposition and consented so far there to as to open them for a time, early in 1866, for the benefit of the Sanitary Fund. A commencement having thus been made, they were definitely made public in May of the same year, a trifling admission fee being charged to defray the expense of keeping everything in proper order.

The gardens cover four acres of land, between 13th and 14th and Market and Mission streets, and about an acre south of 14th street, this last constituting an amphitheater and being connected with the other portion by a tunnel under 14th street. The gardens contain level ground and elevations, the walks are graveled and meandering, the grassy sward is dotted with every variety of flowering vines and shrubs, with trees of different climes. The lake is decorated with a margin of lilies and by large colored globes of glass, mounted on posts, which heighten the general effect. Pandora, Jupiter, Bacchus, Venus, Ceres, Terpsichore, Psyche and the "Dancing Girl," in marble forms, are found here and there in quiet nooks. A rustic fountain spouts by the side of the stream flowing into the lake, and benches and chairs invite to rest.

On the hill, in a grove of dwarf oaks, are the saloon and restaurant, with the platform for the band, and the observatory. On the side of the hill is an arbor built after the fashion of a Turkish mosque. The main building fronts on Mission street, and the lake is in the rear of this. There are five conservatory and plant houses, of

an aggregate length of 300 feet and an average width of 30 feet. The engraving gives a correct representation of the principal one, and will serve to give an idea of a small part of the beautiful grounds. There are, besides, a hennery, a pigeon-house, and a grapery. A gymnasium is fitted up for those fond of athletics. A rotary boat, schooner-rigged, capable of seating a hundred persons, floats around in the lake.

The Art Gallery contains some seventy oil-paintings of merit and two marble busts, one by Hiram Powers. In the adjoining Museum of Miscellanies are two statues, a collection of birds and birds' eggs, one of upwards of a thousand coins of all ages and nations, idols, weapons, minerals and hundreds of other articles. The library contains 1,600 volumes, many of them very rare and costly. The collection of alcoholic specimens is quite extensive. There is another collection of stuffed birds of the highest value, which is exquisite in its colors and varieties.

The Zoological Department is very extensive, and a catalogue of the animals would of itself occupy a large share of our space. Here are animals of various kinds from all countries and all zones. The col-

The rink will be built on ground now outside of the garden and will be in the shape of an L, with sides, each 125 feet long, and of a width of 40 feet. In the angle formed by the two sides there will be a circus ring, and back of this, extending from the wing of the rink to the other, terraced seats will be arranged to accommodate several thousand persons. In the rear of the seats, there will be an orchestra-stand.

Other additions are contemplated. All varieties of pure breeds of poultry will be kept on exhibition; there is to be an aquarium, so that the finny tribe may be more largely represented, etc., etc. It requires now several visits to get a decent idea of what is to be seen, and at the present rate of increase to the attractions, one will soon be obliged to make frequent and periodical calls to keep up with the times.

It may well be imagined that these gardens represent a large amount of capital. A million of dollars would not replace their contents were they destroyed. The expense of keeping the grounds and buildings in repair, of attending to the plants, and feeding and caring for the animals must be very large. Woodward's Gardens are now an important and indispensable feature of our city. They are visited daily

CONSERVATORY OF PLANTS AT WOODWARD'S GARDENS, SAN FRANCISCO.

lection is by far the largest on the coast and is continually being increased. The cages of the live animals always attract a large crowd, while the stuffed collection is hardly less interesting. There are California grizzlies, Oregon panthers, Mexican panthers, South American Jaguars, and Bengal tigers. Camels from Arabia, dogs of the Esquimaux, and kangaroos from Australia are found here. Deer and elk, badgers, racoons, marmots, foxes, weasels, ant-eaters, opossums, black and brown bears, monkeys of all sizes, and very many other animals live in close proximity. Pheasants, turkeys, quails, ducks, geese and chickens, eagles, sparrows, cranes, doves and canaries, of various breeds and hues and from countries remote and near, are confined in cages. Besides all these, which are alive, there are stuffed specimens of bears, snakes, tigers, leopards, hyenas, boars, apes, monkeys, etc.; double-headed, double-bodied and double-tailed calves and horses, etc.; while curiosities and monstrosities of all kinds, alive and dead, swell the catalogue.

The Zoological Department has just been removed into the amphitheater, which is as before stated, on the south side of 14th street. In this amphitheater, which will accommodate 10,000 persons, exhibitions are being continually given—at present a hippodrome forming an attractive feature. The lumber for an extensive skating rink has been purchased, and this additional attraction will shortly be given.

by large numbers of residents and sojourners, and we may therefore be allowed to call the place "one of our parks." They are a public benefit to the city, especially to children and to the poorer classes, and to Mr. Woodward are due the hearty thanks of our population.

A Kind Letter—Our Mining Interests.

EDS. PRESS:—With a host of others interested in mining, I can but congratulate you on the advantage certainly to be gained by a division in the PRESS of the two interests—Mining and Agriculture; and the mining community as well, because they will unquestionably find their pursuit better protected, and material more to their liking. The same may be said by those whose interest is that of agriculture. The two, though of the greatest importance, are conducted by such dissimilar spirits, that what suits one branch fails to entertain the other.

It is now to be hoped, since you propose to give a journal especially devoted to mining, mechanics and science, that it will receive the earnest support of every one interested in our advancement in these respects.

It is a fact patent to all, that no one can publish journals for the fun of it. Like other pursuits, it must have its rewards, good advocates, and material of value. There must be as much interest manifested on one side as the other. The public must do their duty to the journal, by extending its circulation and pecuniary interest, and

the journal must do its duty to the public by giving the best material that time and money can obtain; and as this is the beginning of 1871, and the mining interest is looking up, I am in hopes to see all who can, lend a hand.

So much for the PRESS,—more than intended, when I started out, which was to make some

Observations on the Mining Interests, and on California. That California, and San Francisco especially, wants a good raking down to get the conceit out of, and more industry in her, all who study statistics must agree. For the past three years at least, mining and mining operators have had the scorn of capital; and through neglect have been decider too much by our leading journals, especially those of San Francisco. And why? Because San Francisco was the "Front Door of Creation," consequently, real estate was all that was worth having. And what is now the result? They killed the goose that was laying the golden egg (mainly all that was making real estate hold its value), and now we find a gloomy showing for this interest, in an array of figures truly surprising for sensible people; as follows:

Real estate sales for 1870.....	\$15,680,000
Mortgages on sales, recorded 1870.....	13,872,000

Leaving as cash surplus.....	\$1,808,000
Twelve months' int. on mortgages at 1 per ct. ..	1,664,640

Leaving on a fifteen million transaction only..	\$143,360
---	-----------

as surplus for 1870. "Every dog has his day," is a rough sentence, with considerable meaning in it. It is coming the miners' turn now. This \$13,000,000 on real estate, with 1 per cent., to say nothing about old mortgages coming due, with their 1 and 1½ per cent. interest, has got to be paid. Wheat won't do it; can't do it. Real estate profits cannot do it. And as only gold and silver will answer the purpose, more attention must be, and is going to be, given to mining; and it is to be supposed the miner will look out for his reward for all his "toil and trouble" in waiting for "the good time coming, boys." It is coming; but for us to get the full benefit, that San Francisco and the Pacific States should have, we must look closer to our interest, by affording in our city ample facilities for treating the minerals and metals of the coast, and thus put a stop to this shipping ore and bullion by millions to Europe and, as it will be probably this year, to Omaha, Chicago and St. Louis, to say nothing of those works likely to be built in Utah. These localities are putting forth their energy and capital to a remarkable degree, to cope with which will require considerable of both capital and energy from San Francisco; and, as you well observed in your last issue, it does not want any small sum, but a capital of from \$250,000 to \$500,000 for the purpose. San Francisco's self-interest demands activity, as offers have been made from the East for base bullion at figures which are likely to draw vast amounts eastward, especially should there be any reduction in railroad freights.

Let it be as it may, let us go to work and build up our mining interest in all its various branches. The cry of hard times can soon be changed, if great activity is exercised in this interest. The whole Pacific country never was so prosperous as when we were mining most,—my friend Hopkins to the contrary notwithstanding.

ALMARIN B. PAUL.

San Francisco, Jan. 15th, 1871.

WORTHY OF COMMENDATION.—A telegram from Sacramento, on the 9th inst., reads as follows: "S. J. Nathan is putting up a public drinking fountain, such as are used in the East, in front of his store, corner of Third and K streets. Basins are used to supply horses and dogs, and cups for the use of humans. It is the first of the kind in California, and is ornamental as well as useful." Such an action is worthy of imitation. In these practical days, people are apt to look out too much, but with too limited a range, for themselves. We hope that Mr. Nathan may find a speedy reward, both mental and pecuniary.

IMPROVED.—A telegram from Omaha states that the bridge over the Missouri, at that place, is completed, and that trains are now crossing regularly. This obviates the necessity of the slow and unpleasant transfer by ferry-boat, which was liable at any time to stick on a fresh bar, and will be welcomed by travelers. The permanent railroad bridge of the U. P. R. R. is still far from completion.

PHOTOGRAPHS.—For Cabinet Photographs, or Enamelled Cards, of the very best quality, you must go to the NEW YORK GALLERY, Nos 23 and 27 Third street, San Francisco. Every picture warranted to give satisfaction.

MARAVILLA COCOA.—For Breakfast.—The Globe says: "Various importers and manufacturers have attempted to attain a reputation for their prepared Cocoa, but we doubt whether any thorough success has been achieved until Messrs. Taylor Brothers discovered the extraordinary qualities of 'Maravilla' Cocoa. Adapting their perfect system of preparation to this finest of all species of the 'Theobroma' they have produced an article which supersedes every other Cocoa in the market. Entire solubility, a delicate aroma, and a rare concentration of the purest elements of nutrition, distinguish the Maravilla Cocoa above all others. For home-paths and invalids we could not recommend a more agreeable or valuable beverage." Sold in packets only by all Grocers, of whom also may be had Taylor Brothers' Original Homoeopathic Cocoa and Soluble Chocolate. Steam Mills—Brick Lane, London. 15V2-7

SCIENTIFIC PRESS.—This paper comes to us this week with a full double sheet extra. It contains a full map of California, a map of the San Joaquin valley, with a brief description and statement of the productions of each county, besides the usual mining, agricultural and scientific intelligence. It is a paper that should be in the hands of every farmer, miner and manufacturer of his coast.—*Neo. Transcript.*

SUCCESS IN BUSINESS.—Success in the business world usually depends upon being thoroughly prepared for its duties. Young men if you would succeed in your business career, secure a good practical business education. This question being settled, the next is where to go. Why, go to the best, of course. Go to HEALD'S BUSINESS COLLEGE, located in the new College Building, 24, Post Street, San Francisco. This is the only school upon the Pacific coast where young men can depend upon being thoroughly fitted for Bankers, Merchants, Clerks, and Book Keepers. This school is connected with the "International Business College Association" or Bryant & Stratton chain. Its scholarships are good for tuition in any of the forty colleges, located in all the leading commercial cities of the United States and Canada. There are many interesting features about the school which can not be discussed here. Call at the College and examine its workings. If unable to send for circulars, and HEALD'S COLLEGE JOURNAL, which will be sent free upon application. Address, E. P. HEALD, President, Business College, San Francisco, Cal. 2V22-3mms

Pain is supposed to be the lot of our poor mortals, as inevitable as death itself and liable at any time to come upon us. Therefore it is important that remedial agents should be at hand to be used in an emergency, when the seminal principle lodged in the system shall develop itself, and we feel excruciating agonies of pain or the depressing influence of disease. Such a remedial agent exists in the PAIN KILLER, whose fame has made the circuit of the globe. Amid the eternal ices of the polar regions or beneath the intolerable and burning sun of the tropics, its virtues are known and appreciated. Under all latitudes, from the one extreme to the other, suffering humanity has found relief from many of its ills by its use. The wide and broad area over which this medicine has spread, attests its value and potency. From a small beginning, the Pain Killer has pushed gradually along, making its own highway, solely by its virtues.
Such unexampled success and popularity has brought others into the field, who have attempted, under similarity of name, to usurp the confidence of the people and turn it to their own selfishness and dishonesty, but their efforts have proved fruitless, while the Pain Killer is still growing in public favor.

ROOT'S PATENT FORCE BLAST ROTARY BLOWER.

MANUFACTURED BY KEEP & BARGION,

At the Globe Iron Works, Stockton, California.

Awarded the First Premium at
the Paris Exposition.

Patented Nov. 1st, 1864; July
24, 1866; and Oct. 9, 1866.

ADAPTED
FOR
Smelting,
Foundry,
Mining
and
Steamships.

REQUIRES
Fifty Per Cent.
LESS POWER
Than any Blower
Now in use.

One of these Blowers may be seen on exhibition at W. T. Garratt's Brass Foundry, corner of
Mission and Fremont streets. They are also in use at the Almaden Quicksilver Mine; Gridley's
Foundry, Gold Hill, Nevada; Etna Iron Works, San Francisco, and many other places.

CAUTION.—Purchasers will find it to their advantage to apply direct to the Stockton Agency, as
certain parties, not authorized to manufacture the Blower, have put in the market machines of inferior
construction, which do not answer all the requirement of the genuine article.

Quartz, Saw and Grist Mill Irons, Steam Engines, Horse Powers, High and Low
Pressure Steam Engines, Steamboats and Propellers, made at short notice.

For circulars and further information address

THE
ASPHALTUM PRESSURE PIPE
COMPANY,

HAVING ERECTED A MANUFACTORY
of sufficient capacity to supply their Asphaltum Pipe in
large quantities,

Are now Prepared to Take Orders
AND MAKE CONTRACTS.

This Company will manufacture Pipe and guarantee
it to stand any pressure required; it is lighter than iron
pipe and more durable, it is not affected by chemical
action, cannot corrode, and being glazed imparts no dis-
agreeable taste to water. To miners and farmers it is
invaluable; any body can put it down; it is twenty per
cent cheaper than iron pipe and ten times more durable.
For further particulars, apply at the office of the Com-
pany, Room No. 2, 645 Market street.
Circulars sent on application. 16v21-tf

LEA & PERRINS'
Worcestershire Sauce.

Declared by Connois-
seurs to be the only good
SAUCE. The success of
this most delicious and
unrivalled Condiment
having caused certain
dealers to apply the
name "Worcestershire Sauce" to their
own inferior compounds, the public is
hereby informed that the only way to
secure the genuine is to ask for LEA
& PERRINS' SAUCE, and see that their names
are upon the wrapper, labels, stopper and
bottle.

Some of the foreign markets having
been supplied with a spurious Worcester-
shire Sauce, upon the wrapper and labels
of which the names of Lea and Perrins have
been forged, L. and P. give notice that they have furnished
their correspondents with power of attorney to take in-
stant proceedings against manufacturers and vendors of
such, or any other imitations by which their right may
be infringed.

Ask for LEA & PERRINS' Sauce and see name on
wrapper, label, bottle and stopper.

Wholesale and for export by the Proprietors, Worces-
ter; Crosse and Blackwell, London, &c., &c., and by
Grocers and Chemists universally. Agents, CROSS
& CO., San Francisco. 1v22-lyeow

NOTICE.
THE undersigned having completed arrangements through one of the first "Promoters" in Europe, for placing CALIFORNIA MINING SECURITIES ON THE LONDON MARKET, is now able to offer superior facilities for disposing of reliable mines of gold, silver or other minerals, as above stated. All properties given in my charge will be placed direct, without loss of time, upon the London Market, through a perfectly reliable party, long resident and entirely familiar with the business. Every advantage offered to parties owning shares in American mines worked by English capital, to dispose of the same. Advances made and ample security given when required.

Miners, Look to Your Interests!

SAVE EXPENSE.

Use the most economical working machinery for crushing your ores.

The Wilson Patent
STEAM STAMP MILL

IS AN
IMMENSE SUCCESS.
NO MINER STUDYING HIS INTERESTS WILL USE ANY OTHER MILL.

It costs a great deal less than any other mill and does its work for from twenty-five to fifty per cent. less expense.

The Wilson Steam Stamp Mill
CRUSHES ONE TON PER HOUR

HARDEST QUARTZ,
THROUGH THE ORDINARY SCREENS.

One of these mills now being used as custom mill,

AVERAGED,
On Rock from Twenty-two Mines,
Twenty-eight Tons Per Day.

It uses about three cords of wood for twenty-four hours.

Is all complete when it leaves the shop, and weighs about 6,500 pounds, and can be put in operation in one week after it reaches the mines.

THE COST
of this mill all complete, including boiler, pump, setting and everything in complete running order at the mine is

NOT OVER ONE HALF
THE EQUIVALENT
OF ANY OTHER MILL.

These mills have now been in practical operation for nearly three years, and have proved in point of

Durability, Economy and Efficiency,
TO HAVE
NO EQUAL.

It requires no skill to run them and any one of ordinary abilities can set them up. The success of these mills having been so unprecedented that we now

GUARANTEE THEM

to be all that we claim for them and guarantee all repairs for twelve months.

One of these Mills can be seen at the Pacific Iron Works.
For further particulars address,

FURMAN R. WILSON,
San Francisco.
OR
Wilson Steam Stamp Mill Co.,
326 Walnut street, Phila., Pa.

THE WILSON
Patent Steam Stamp Mill.

This extraordinary Mill, now so justly popular in the East, is now offered to the miners of the Pacific Coast. Having been in operation now for about two and a half years, the Company feel confident that the

WILSON STEAM STAMP MILL,
For Durability, Efficiency,
AND ECONOMY OF WORKING,
HAS NO EQUAL.

The Wilson Steam Stamp Mill is the only Steam Mill that has had the severe ordeal of practical working, and proved itself eminently successful. It is now in operation in several of the Eastern States and Territories, and gaining an enormous popularity. The whole machine is so simple as to be readily understood by the most ordinary minds. In fact, its simplicity is its durability. The expense of crushing rock or cement with this Mill is less than one-half the expense of any other Stamp Mill, and less than one-half the cost. For further particulars inquire of

FURMAN R. WILSON,
San Francisco.
Or of THE WILSON STEAM STAMP MILL CO., 926 Walnut street, Philadelphia, Pa.

NOTICE.—All persons are hereby warned not to manufacture or use any Steam Stamp Mills that are an infringement on the Wilson Patents, as they will be prosecuted to the utmost rigor of the law.
P. R. WILSON,
20v19-1f Supt. W. P. S. S. M. Co., Philadelphia.

STEAM JET PUMP.
Blakely & Williams' Patent, for
Water, Oils, Acids, Etc.

The best cold water pump for filling tanks for stationary or portable Steam Engines. Also highly recommended for MINES, DISTILLERIES, SALT WORKS, STONE QUARRIES, and similar places, and saves the expense of putting up and running an engine.
We ask the attention of all proprietors of steam power to the following points of merit.—It is operated by steam taken directly from the Boiler into the Pump; it has no valve or wearing parts of any kind; it requires no belts, pulleys, or machinery of any kind; it operates entirely independent of an engine; it will not choke up with foul water; it costs much less to put up and start; it will not wear out in a lifetime, or require repairs; it is reliable, and certain to work at all times; it is not liable to injury from freezing.
Satisfaction guaranteed or the money refunded.
Send for Circular. PARKER & HUNT,
Southeast cor. Tenth & K Streets, Sacramento City Cal.
AGENTS—CHAS. F. BROCK, 117 California st., San Francisco; KEEF & BARGION, Stockton. 21v21-1f

Varney's Patent Amalgamator.

These Machines Stand Unrivaled.
For rapidly pulverizing and amalgamating ores, they have no equal. No effort has been, or will be spared, to have them constructed in the most perfect manner, and of the great number now in operation, not one has ever required repairs. The constant and increasing demand for them is sufficient evidence of their merits. They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.

This Amalgamator Operates as Follows:

The pan being filled, the motion of the miller forces the pulp to the center, where it is drawn down through the aperture and between the grinding surfaces. Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly passing a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.
Settlers made on the same principle excel all others. They bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed.
Mill-men are invited to examine these pans and settlers for themselves, at the office, 229 Fremont Street, San Francisco.

OUR U. S. AND FOREIGN PATENT AGENCY presents many and important advantages as a Home Agency over all others by reasons of long establishment, great experience, thorough system, and intimate acquaintance with the subjects of inventions in our own community. All worthy inventions patented through our Agency will have the benefit of an illustration or a description in the Scientific Press. We transact every branch of Patent business, and obtain Patents in all civilized countries. The large majority of U. S. and Foreign Patents granted to inventors on the Pacific Coast have been obtained through our Agency. We can give the best and most reliable advice as to the patentability of new inventions. ADVICE AND CIRCULARS FREE. Our prices are as low as any first-class agencies in the Eastern States, while our advantages for Pacific Coast inventors are far superior. ENGRAVING ON WOOD, of every kind, for illustrating machinery, buildings, trade circulars, labels, plain or in colors, designed and cut in the best style of the art by experts in our own office. Also, engraving on metals.

The California Powder Works
No. 314 CALIFORNIA STREET,
SAN FRANCISCO.

Manufacturers and have constantly on hand

**SPORTING,
MINING,
And BLASTING
POWDER,**

OF SUPERIOR QUALITY, FRESH FROM THE MILLS. It being constantly received and transported into the interior, is delivered to the consumer within a few days of the time of its manufacture, and is in every way superior to any other Powder in Market.
We have been awarded successively

Three Gold Medals

By the MECHANICS' INSTITUTE and the STATE AGRICULTURAL SOCIETY for the superiority of our products over all others.
We also call attention to our

HERCULES POWDER,

Which combines all the forces of other strong explosives now in use, and the lifting force of the BEST BLASTING POWDER, thus making it vastly superior to any other compound now in use.
A circular containing a full description of this Powder can be obtained on application to our Office.

FLORAL GUIDE
For 1871.**

THE FIRST EDITION OF ONE HUNDRED AND FIFTY THOUSAND copies of **Vick's Illustrated Catalogue of Seeds and Floral Guide**, is published and ready to send out—100 pages, and an Engraving of almost every desirable Flower and Vegetable. It is elegantly printed on fine tinted paper, illustrated with Three Hundred fine Wood Engravings and Two beautiful

COLORED PLATES.

The most beautiful and the most instructive Floral Guide published. A GERMAN EDITION published, in all other respects similar to the English.
Sent free to all my customers of 1870, as rapidly as possible, without application. Sent to all who order them for Ten Cents, which is not half the cost. Address

SCIENTIFIC PRESS.

AN ILLUSTRATED JOURNAL OF SCIENTIFIC AND INDUSTRIAL PROGRESS,
Mining, Mechanic Arts and Inventions.

BY DEWEY & CO.,
Patent Solicitors.

SAN FRANCISCO, SATURDAY, JAN. 21, 1871.

VOLUME XXII.
Number 3.

Academy of Sciences.

At the regular meeting, last Monday, specimens of the flesh of the teal duck, in which were small parasites (*entoza*), were presented. Gregory Yalo delivered an opinion on the status of the Academy to the effect that before it have a legal character and be able to proceed with the business of building, as contemplated, it must re-incorporate and elect Trustees. Accordingly an agreement to incorporate was signed by the members present, and an election of Trustees will be held on Feb. 6th, at 7½ P. M.

Prof. Davidson made some remarks on the location and height of Mt. Rainier, on both of which points errors have hitherto prevailed. Recent observations of the Coast Survey have determined that it is in lat. 46 deg. 51 min., and lon. 121 deg. 45 min. 28 sec. Its height is 14,444 feet, which gives it a place above our other peaks as far as they have been definitely measured.

The Sutro Tunnel Bill.

The principal points of this Bill, as introduced into the Senate, by Mr. Nye, and referred to the Committee on Public Lands, are as follows:

All moneys received by the United States from the sale of mineral lands are to be set apart as a special "mineral land fund," and from this the Sutro Tunnel Company are to be assisted to the extent of not over \$3,000,000, to be advanced as a loan which is to be repaid, after completion of the tunnel, with 25 per cent. of the net profits of the Company. For every 500 feet of tunnels, shafts or branches, after being accepted, the Government pays \$50,000, and has a first mortgage and lien on the whole property of the tunnel.

If the Company fails to fulfil its part of the contract, the tunnel is to be taken possession of by the Secretary of the Treasury for the use and benefit of the U. S. All extra funds and part of the payments of the Company are to be set apart for the establishment and maintenance of a National School of Mines.

The position and size (10 x 12 ft.) of the tunnel are defined, and provisions are made for securing the interests of the government. The Bill is in the hands of the Committee on Public Lands for investigation and report.

ANOTHER PETRIFIED FOREST.—The Russian River *Flag* of Jan. 12th, announces the discovery of a field of petrified trees:—It is situated near the ranch of Charles Alexander, at the lower end of Alexander Valley, and about 12 miles from Healdsburg. He does not know over what extent of country it exists, as he had not an opportunity of prospecting extensively at the time he was there. He saw a large number of trees and stumps, and a great amount of the limbs in broken fragments, all over the country. Many of those that remain standing are on a hillside and stand perpendicular to the surface of the ground.

Lamp Attachment for Sewing Machines.

The importance of a good light directly on the work in hand, and not thrown into the eyes of the operator, cannot be overestimated, especially for those persons who are obliged to subject their eyes to severe tests. Only too little attention is paid to this matter, and we consequently see many with sight weakened and injured.

In using sewing machines, there is considerable difficulty in securing such a light. A lamp placed on the machine interferes greatly with the operations, and is liable to be knocked over. Experience in this

to the machine. By the uses of such a device, not only is increased speed in work obtained, but the eyes of the sewer are protected from injury.

A patent has been granted for this invention, through the SCIENTIFIC PRESS patent agency, to Mr. Campbell, of this city. Messrs. Cohen and Campbell, 912 Kearny street, are the general agents, and will furnish any further information desired.

Snow Plow.

Any one who has been "snowed in" on a

IMPROVED LAMP ATTACHMENT FOR SEWING MACHINES.

SHAW'S IMPROVED SNOW PLOW FOR RAILROADS.

matter has led to the invention here illustrated, which is a neat and simple bracket, easily adjusted so as to throw the whole light directly where it is needed. By this arrangement, the light can be directed to any desired point, while the lamp is securely held in a position which does not interfere with the working of the machine. The cut shows the device sufficiently well without need of description.

The lamp used in connection with the bracket is a medium-sized hand lamp, which can be detached and used for other purposes if desired. An improved burner and a neat shade are used, and the whole can be made quite an ornamental addition

to the machine. By the uses of such a device, not only is increased speed in work obtained, but the eyes of the sewer are protected from injury. A plow, then, which will not stick, nor bank up the snow before it, and which will rapidly clear away the obstructing drift, is an object of interest to all travelers. Such a plow has been invented, according to the claims of the patentee. Its construction will be seen from the accompanying engraving. Its principal point is the method of working the plowshare.

This plowshare consists of two leaves,

forming, when in working position, a rectangular platform inclined at an angle of about 20 degrees with the horizontal. This is pivoted, transversely of the truck, so that by turning the crank, shown at the rear of the platform, it can be revolved into a horizontal position, such power being secured by the intervening toothed wheels and knee joint that no weight of snow on the platform can keep it from revolving. Or by proper connections, on throwing the wheels into gear, the backing of the engine can be made to accomplish the same result. The two leaves of the platform are hinged at the outside edges, and connected by a two-branched chain passing over a pulley placed in the top of a pillar above the floor of the plow truck, with a windlass beneath the floor, which is fixed on a shaft bearing a toothed wheel, that may be slid into gear with a toothed pinion on the front axle of the locomotive. The whole may be thrown into gear by the operator, by means of the lever shown on the right hand of the truck, when the leaves will unfold and dump their load on each side of the track.

The plow is to be used as an ordinary snow plow until the banking up of the snow before the locomotive brings the train to a stand-still. Then the platform is to be revolved to a horizontal position, the locomotive backs and carries with it a load of snow, which is tossed to each side, at any convenient point, by revolving the two leaves. These fall again into position, the platform is inclined, the engine driven forward, another load of snow taken up and deposited as before. This operation can be repeated very rapidly until the track is sufficiently clear for the train to proceed.

The invention is ingenious and if successful will be blessed by many. It is the device of Mr. Thomas L. Shaw, of Omaha, Nebraska, who should be addressed for any further information.

CALIFORNIA RAISINS.—We meet with notices in nearly all our agricultural exchanges, speaking of small lots of raisins which have been produced, the past season, in their various localities. These facts are of considerable interest as showing that the attention of our grapegrowers is being more than ever turned to this important product. This is no reason why we should not prepare at home all the raisins needed for the supply of this coast. Let our grapegrowers experiment in this direction—put up their own raisins, at least, and gradually educate themselves so that they may eventually prepare them for the market. Grapes are worth only two, three, or four cents per pound, while raisins are worth from 15 to 25 cents—a large per centage to add to the raw product.

THE IRON AGE.—This valuable exchange comes to us this year considerably enlarged and improved. It is an able supporter of the interests which it represents, and its Market Reports and Quotations, prepared with especial care, are very complete and reliable. We often find matter for quotation in its columns; and we wish it continued success. Published by David Williams, 80 Beekman street, New York.

MECHANICAL PROGRESS.

VACUUM TANNING.—The editor of the *Boston Hide and Leather Interest* has recently visited the establishment of Messrs. Norton, Dorr and Hunt, at Lewiston, Maine, to see the working of the above named process, and thinks it well worth the attention of tanners. The "vacuum tank" is of wood, copper lined, and capable of containing 100 "sides." At one end, an air-tight iron door, also copper-lined, is opened to receive the hides, which are hung upon hooks within, and the door is then closed. Several "junks," containing tanning liquor of different strengths, are placed underneath the tank, and connected with it by copper pipes so arranged that the liquor from either alone can be admitted into it at will. At the top of the tank enters the pipe from an air-pump driven by water power. There is a pipe and stopcock to admit the external air at the proper time; also a vacuum gauge and a liquor gauge. Everything being ready, the air-pump is started, and at the proper moment as indicated by the vacuum gauge, the liquor from one of the junks is let in, and allowed to flow until the gauge shows that no more will enter, when it is stopped, and the external air admitted. In about two hours the liquor is drawn off and a stronger one sent in in the same way from another junk, and so on, the strength being greater and the time longer for each. The liquor is changed four times the first day, and afterwards as often as may be necessary. The time required to tan a calf skin is two or three days; the heaviest hides need twenty. Some belting which was tanned in 16 days by this process had been running for several months, and was pronounced a very superior article.

The advantages claimed for this method are,—the saving of time,—and therefore of interest on the cost of hides until they are returned to the market as leather,—the saving of labor,—as the hides have to be handled but once,—the saving in bark,—for there is not time for chemical changes which affect the tannin,—and the increased weight, owing to the comparatively slight loss of gelatine by decomposition in a tanning so rapidly carried through. Although the first cost of the "plant" is somewhat greater than for the usual method, these advantages are said to largely counterbalance it.

TRANSMITTING POWER BY MEANS OF COMPRESSED AIR.—At a late meeting of the Polytechnic Club of the American Institute, W. S. Henson read a report prepared by him for Horace H. Day, who had employed him as engineer to conduct a series of experiments, to determine the feasibility of a plan for utilizing at Buffalo, N. Y., a 206 foot fall at Niagara, on the American side, 20 miles distant. We quote from this report:—"In response to your request for the elements necessary for the transmission of 5,000 horse power from Niagara Falls to Buffalo (about 20 miles), using your magnificent power of 206 feet fall, I suggest the utilization of 185 feet of this fall by the direct compressing power of a column of water acting as a ram, without the intervention of water wheels or the friction of cylindrical compressors with moving pistons, because by the use at that point of such compressors, you absorb the heat generated in the act of compression and avoid the loss from friction by piston or cylinder, and all the wear and tear of ponderous water wheels. This direct acting hydraulic pressure, working in one sense as a ram, may be made to develop any amount of pressure desirable, and taking into account the cost of pipes and other considerations, I would suggest that the pressure should not be less than 80 lbs. or more than 100 lbs. per square inch; and a pipe of 42 inches in diameter would transmit from Niagara Falls to Buffalo a column of air compressed to 100 lbs., with a velocity of ten feet per second, and a loss from friction of tube, for the whole distance, not exceeding one per cent. of the power transmitted, and deliver for use over 5,000 horse power of cold air. I should recommend, however, a pipe of 36 inches diameter, which should deliver a column of air at 100 lbs. pressure and 14.33 feet per second terminal velocity, and give a full 5,000 horse power of cold air, worked expansively at a loss by friction and exceeding five per cent. for the 20 miles."

NEW MINING LOCOMOTIVES.—The *U. S. Railroad Register* of Dec. 24th describes two small locomotives just completed at the Baldwin Works, for the Wilkesbarre Coal & Iron Co., to take the place of mules underground. We give part of the description: "The wheels were small, but heavy, with a broad, flat tread, and very light flange. The two cylinders, 9 inches in diameter (inside) by 12 inches stroke, lie under the front end of the boiler. The piston rods play between groups of four square slide rods, and a simply adjusted link motion works just forward of the fire box. The connections are of course inside, on the cranked axle of one of the two pairs of drivers (of 30 inches), which are the only wheels. The fire box and low platform overhangs behind. As coal is always at hand, no coal space is needed, and the water tank is folded over the top and sides of the boiler, acting as a jacket, and feeling quite hot to the hand. This tank holds 190 gallons, and the whole engine, with fuel and water weighs nearly 15,000 pounds. The makers guarantee that it shall haul, under all circumstances, with wet and dirty rails, on a level, 340 gross tons; on a 60 foot gradient, 80 gross tons; and on a 100 foot gradient, 50 gross tons."

SOLUTION OF SILK IN PHOTOGRAPHY.—We have alluded to the paper by J. Spiller, F. C. S., upon a method for the detection of other fibres in fabrics purporting to be entirely of silk, based upon the fact that silk alone is immediately and completely soluble in concentrated hydrochloric acid. In conclusion, Mr. Spiller remarks briefly upon the chemical properties of this silk solution. We quote: "The mucilaginous liquid so prepared cannot be evaporated, even over a water bath, without becoming somewhat carbonized; the free acid may be partially separated by dialysis, or by exposure to air in a shallow capsule, placed within a bell-jar charged with a liberal supply of slaked lime to absorb the hydrochloric fumes, but the resulting solution will not then bear dilution with water without precipitation of the animal matter. Ammonia, added in excess, forms a clear solution, which I am hopeful of being able to employ in photography; for when this liquid is evaporated, there is left a brown saline residue of rough astringent flavor, which, when mixed with aqueous nitrate of silver, gives a peculiar flocculent form of argentic chloride, which is no longer curdy, and much more rapidly affected by light than the ordinary condition of chloride of silver. These properties enable the silk compound to be usefully employed in the production of "matt-paper" prints and direct solar-camera enlargements. Its application to the collodio-chloride process appears also to be worthy of trial."

THE "WHITE CLOUD" ENGINE.—We take the following from *The Engineer* of Dec. 9th: "At the request of the inventor, we have recently been present at trials with a first experimental engine on a new principle. This engine compresses air in stages, passing it at each stage through water, by which process it is highly saturated, and the heat given out by the compression of the air at each stage is so entirely taken into the saturation, that even at the 400 lb. per square inch of pressure at which the engine was run during the trials, we witnessed the pumps remain quite cold. The highly compressed "white cloud" resulting from the operation is passed onwards to a coil in a heating chamber, and from this coil to the cylinder. As in all first experimental engines, both the arrangements and proportions are admittedly as yet very imperfect. We may instance one evident defect in the fact that, with the charge cut off at one-fourth the stroke, and 400 lb. pressure, 100 lb. of pressure is wasted into the exhaust. This excessive waste with a largercylinder might be saved, and with other advantages obtainable from such increase in its size, might be expressed in effective power. With a cylinder of 4½ inches diameter, and a 6-inch stroke, an exertion of about 4-horse effective power on a continually suspended load was obtained, at a consumption of fuel about equal to that used by those prize engines at the late Oxford engine trials, which so exerted that amount of horse-power."

SCIENTIFIC PROGRESS.

MIOCENE MAN NOT PROVED.—The following is from a notice by W. Boyd Dawkins, in *Nature*, of M. Hamy's "Palæontology of Man": "The evidence adduced by M. Bourgeois of the discovery of flint flakes and scrapers in the Miocene strata of Thenay, along with remains of the hornless rhinoceros and mastodon, proves, according to M. Hamy, that man was an inhabitant of Miocene Europe. It is, however, rejected by most of the French and English savants, because M. Bourgeois has not shown that the implements in question may not have been derived ultimately from the surface of the ground, where they are very abundant. While M. Hamy acknowledges this to be the case, he does not see its full bearing on the value of the testimony. The implements probably are of Quaternary, or even of post-quaternary age, and certainly cannot be considered decisive of the sojourn of man in Europe during the Miocene epoch, although the climate at the time was almost tropical, and the conditions of life easy. Nor can the evidence of the grooved bones of Hali-there, found by M. Delaunay at Puncé in Maine-et-Loire he accepted, because it cannot be proved that the grooves may not have been caused by some other agency than that of man. The proof of the existence of man in Europe during the Pliocene epoch derived from the striæ in the fossil bones found at Saint Prest and in the valley of the Arno, accepted by M. Hamy, is equally unsatisfactory. The flint "arrow-head" and other rude fragments said to have been obtained at the former place from the same horizon as the bones of *Elephas meridionalis*, by M. Bourgeois, the stout champion of Miocene man, do not afford the precise and exact testimony which is demanded for the establishment of the case. The presence, indeed, of man in Europe in the Miocene and Pliocene epoch is as yet non-proven, and we must be content to await future discoveries. The result of the labors of archaeologists and geologists throughout Europe during the last ten years has not placed the advent of man further back than the river gravels of the Somme, and the epoch of the caves, both of which are post-glacial or post-pliocene, or quaternary, in other words posterior to the great submergence and refrigeration of northern Europe, through which many of the Pliocenemammalia were destroyed."

Eozoön CANADENSE.—It will be remembered that some time since Messrs. Logan, Dawson, Carpenter and Hunt, announced the discovery of organic remains in the Laurentian rocks of Canada; and it was said that here we had the earliest known trace of animal life. The subject has been considerably discussed. *Nature* for Dec. 22d contains a letter from T. M. Reade, in which, after briefly reviewing the history of the controversy, the writer gives his own reasons for considering the so-called organism a merely mineral production. We quote a single paragraph: "The broad fact then remains unshaken that in unaltered rocks no Eozoön structures have yet been discovered. On the other hand, in metamorphosed rocks such structures are abundant, and even Dr. Gümbel, of the Bavarian Survey, a believer in Eozoön, has been much mystified by finding its features in impossible places. Not only do we find it in the Laurentians, but in rocks of a much later date, but curiously only in those that have undergone alteration. If it be an organism, then hydrothermal action, it seems, is necessary to its development, not as one would suspect during life, but ages after its entombment in sedimentary deposits."

ABSORPTION OF SULPHUR BY GOLD.—A paper with the above title was read at a recent meeting of the Philosophical Society at Wellington, New Zealand, by W. Skey, Government analyst. The author, while recently investigating the causes of the reported loss of gold at the Thames gold fields during its extraction from the ore, found that gold is acted on by sulphuretted hydrogen, and thus a sulphide is formed which tarnishes the surface. Also that gold combines with free sulphur at a temperature of 212° Fahr. Gold thus sulphurized on the surface will not amalgamate with mercury. The loss of gold is not altogether due to the condition of the mercury, as has hitherto been supposed, as he has found this sulphide on the surface of native gold of every degree of purity.

VISION UNDER WATER.—A correspondent of *Nature* makes a "Contribution to the dioptries of vision," from which we quote: "A couple of watch-glasses, placed with their concavities towards one another, so as to enclose a convex lenticular portion of air, when immersed in water, disperse the rays of light and diminish the size of objects seen through them, because they force the more refractive medium, the water, to assume a concave shape in relation to the air between the glasses. The same watch-glasses placed with their convex surfaces towards one another, and connected around their edges by a water-tight rim, thus enclosing a concave lenticular portion of air, when immersed in water, refract the rays of light convergently to a focus and magnify objects, because they force the more refractive medium to assume a convex shape in relation to the air between the glasses. Their magnifying power or focal distance under water is somewhat less than that of the same glasses in the reversed position and filled with water is in air; the slight difference being owing to the greater refractive power of the glass in air than in water. I found that two glasses of a curvature of about 1½ inch radius thus placed formed in water a lens having a focus of about two inches. This *air-lens*, as it may be called, completely supplies the loss of our anterior lens in water, and restores perfect vision. Of course the same magnifying power may be obtained by various combinations of differently curved glasses, or by plano-concave or concavo-convex air-lenses. The advantages of this kind of lens for subaqueous vision over a glass lens are obvious. It can be made of any required size so as to command a large lateral field of vision. It ceases to act as a lens the instant it emerges from the water, and does not interfere with vision in the air, as then we merely look through two thin pieces of glass with some air between them. There is no provoking loss of refractive power, as in the case of the glass lens; and lastly, it can be made very cheaply. With either form of lens we can see from below the water objects in the air above us quite distinctly if the surface of the water is smooth, less distinctly if it is agitated."

THE YALE EXPEDITION.—The *New York Herald* of Dec. 24th has an article giving some notes of the excursion of Prof. O. C. Marsh's scientific party, among which we find the following:—"At the Antelope well, where Prof. Marsh discovered, in 1868, the fossil liliputian horse, which he has since named *Equus parvulus*,—were found several others, making in all eighteen distinct species of fossil horses so far discovered on this continent. "Of the other animals obtained from this well, there were two kinds of rhinoceros, an animal something like the hog, one or two allied to the camel, and two or three carnivorous animals, one of them larger than a lion. In all, fifteen species of extinct animals were found in a space of ten feet in diameter and only six or eight feet in depth, making it by far the most remarkable animal discovery ever made in any part of the world. It is supposed this locality was once the margin of a great lake, and that the animals sunk down in the mire when they went into the water to drink."

AFRICAN EXPLORATIONS.—Dr. Petermann, the leading geographical authority in Germany, has just received important letters and maps from the distinguished African explorer, Dr. Schweinfurth with news to the 29th of July. This traveler reports a lengthy journey in the direction of the equator, by means of which our previous knowledge of the sources of the Nile has been enlarged, and to some extent modified. The source of the Shari river, flowing into Lake Tsad, has been discovered, and Lake Piaggias, of which so much has been written, has probably no existence!—*Courant*, Dec. 31.

SULPHURET OF ZINC.—A. Wagner records a series of experiments made with sulphuret of zinc, purposely prepared and left standing exposed to the air. The chief result is, that sulphide of zinc hardly oxidizes at all; and for what little it does, it evolves sulphuretted hydrogen, and differs essentially from the sulphurets of iron and manganese, which become, under the same conditions, converted into oxides, sulphur being set free.—*Dingler's Journal*.

DELICATE COLOR-TEST FOR STRYCHNIA.—W. T. Wenzell finds that a solution of one grain of permanganate of potassa in two thousand grammes of sulphuric acid will detect even a trace of strychnia.

CORRESPONDENCE.

Bound East.

(Continued from page 19.)

The Union Pacific Railroad.

The enterprise shown in building this road, the longest in the world, cannot be too highly praised, and its present and prospective value to the whole country cannot be over-estimated. Roads are great civilizers. The action of Marshal Wade in building common roads in Scotland, years ago, is said to have exercised a more beneficial effect on that country in advancing the interests of the people in all respects, than had been accomplished by the most strenuous exertions of legislators and philanthropists during long periods of time. What Wade's roads did for Scotland, our railroads are doing for the United States. Our trans-continental road is opening up vast natural resources, which otherwise would remain lost to the world.

The present Board of Managers of the road are deserving of the highest credit for the manner in which they conduct the affairs of so great and important an institution. They are liberal in their action, ever ready to aid in developing the districts along the line, and do all in their power to forward the interests of the country. In these matters they are aided by the efficient corps of officers connected with the road. The road is built as well and managed perhaps better than most Eastern roads, the traveler has the best of accommodations, and the freight charges are indeed remarkably low.

There has been considerable discussion as to which is the shortest route from St. Louis to San Francisco—*via* Omaha or *via* Kansas City. A gentleman writing to a paper in Omaha, quotes these figures: From St. Louis to Omaha, 438 miles; from Omaha to Cheyenne, 516 miles; total, 954 miles. From St. Louis to Kansas City, 272 miles; from Kansas City to Cheyenne, 745 miles; total, 1,017 miles; showing a difference in favor of Omaha of 63 miles. This difference will be increased fully 100 miles as soon as another road, now building, is completed.

Omaha and Council Bluffs.

Omaha, the present terminus of the Union Pacific Railroad, is a go-ahead place of 15,000 to 18,000 inhabitants. It was the first settlement made in Nebraska, although it did not attain any considerable importance or size until the Union Pacific Railroad was inaugurated. Since that time it has grown very rapidly. It has a large area of fertile territory tributary to it, and its connections by steamboat and locomotive are bringing to it a vast amount of trade. It now supports four newspapers, has a large number of hotels, contains many fine residences, etc., etc. Between this city and Council Bluffs, situated just opposite, on the east side of the Missouri (but three miles back from the banks of the river), there is considerable rivalry. Council Bluffs is also quite old as a settlement, but young as a city. It was the Kanessville of the Mormons from 1846 until 1853, when the present name was adopted.

The great bridge over the Missouri, built by the Union Pacific, is one of the first objects of attraction. It is built after "Post's patent," will be of iron and half a mile long. It will be 50 feet above high water mark, and will rest on hollow iron pipes (cylinders, 8½ feet in diameter), filled in with concrete, rock, etc. The spans, 250 feet in length, are 11 in number. Work is going on night and day, and the bridge will be completed some time in 1871. I am told that it will cost about \$2,000,000.

The machine shops, etc., of the railroad are well worth a visit. They are situated near the river on a tract of some 30 acres in area, are of brick, and are most complete in all respects.

The 12,000 inhabitants of Council Bluffs are live people. They have a street rail-

way, several papers, fine school houses and churches, a large (the State) Deaf and Dumb Asylum, several flouring mills, and other evidences of progressing civilization. The Council Bluffs Iron Works must not be forgotten. Here 40 men are employed. The company has just secured the control of Borchoff's (?) improvements in mining machinery, among which pressed shoes and dies deserve mention. These are made of the best and toughest iron, cast with neck down, and while hot subjected to a heavy screw pressure, which makes them very solid and close-grained. I am informed that they have been tested thoroughly in Colorado, and have given great satisfaction, being very durable.

The Omaha Reduction Works.

Meeting Mr. Leopold Balbach, I was kindly invited by him to take a walk through the works of the Omaha Smelting and Refining Company. Mr. Balbach has been engaged from boyhood in the smelting operations carried on at Newark, New Jersey, and the company has been fortunate in being able to secure his valuable services as superintendent.

Being anxious to furnish items of interest to the readers of the Press, I send you on the information which I have obtained, I try to give facts, and facts only.

Ground was broken on the 15th of October. The U. P. R. R. Co. granted the company all the ground which they required, and a side track has been laid to the works, which are now nearly completed. On and after the first of January, the company will be prepared to receive ores and bullion.

The main building is 40x80 feet. Here are two reverberatory furnaces, two shaft furnaces, four separating furnaces and a cupelling furnace. In a side-building, 30x30, is placed a 20-horse power engine, with boiler, etc. Each separating furnace has a capacity of from 4 to 5 tons in 24 hours, is 6x9 feet, the hearth 4x5 feet, and the kettles are 22 in. deep and 30 in. in diameter. The main stack is 55 feet, and the second is 35 feet high. There will be used for furnaces, stacks, etc., 15,000 fire-brick and 175,000 common brick; also 20 tons of castings, etc. The iron work comes from the foundry of Hall and Brothers. They are now building an addition, 30x40 feet, with two more furnaces for refining the lead.

When the works are running, some 20 or more workmen will be employed. Coal from the Wyoming coal mine, on the U. P. R. R., will be used in the reverberatory furnaces. Arrangements have been made with the railroad, by virtue of which ore will be transported from Ogden to the works at the rate of \$100 currency per car load of 10 tons. The charges will be: for reducing ores, \$30 to 50 currency per ton; for desilverizing bullion, \$16½ to \$22½ currency per ton. Returns will be made in two to four weeks. The company will increase the capacity of the works as they may find it necessary.

The Balbach Process.

The Balbach process for separating silver and gold from lead will be used here. The process consists in melting the lead that contains the gold and silver in a furnace with an inclined hearth, and drawing it off into a kettle containing a certain amount of zinc in a molten state. After all the lead is thus drawn off, the latter is thoroughly mixed with the zinc, after which it is cast into pigs or bars and replaced in a similar furnace, and just sufficient heat given to melt the lead, but not to melt either zinc, silver or gold. The latter alloy is then placed in retorts where the zinc is distilled off from the silver and gold with a small portion of the lead, after which the latter three metals are placed upon a cupel for further refining.

(To be continued.)

Notes of Travel in San Joaquin County.

(Written for the Press.)

Stockton Statistics.

San Joaquin County at present contains 21,079 inhabitants, an increase of 124 per cent. in ten years. The city of Stockton (the county seat) is situated on the San Joaquin river, 125 miles from San Francisco by water and 90 miles by rail, and 50 miles from Sacramento. It contains 10,033 inhabitants, a gain of 170 per cent. in 10 years, and is the fourth city in the state, as regards population, but the second in manufactures. Of these last I will speak further along. The outstanding indebtedness of the county is but \$314,102, without any floating indebtedness. The following returns, from the U. S. Marshal's report,

show the real value of property in the county to be \$23,474,805, an increase of \$20,591,761 in ten years. The real estate transactions for the 12 months ending Dec. 31, 1870, were \$1,085,488; the U. S. Land Office sales for the same period, in the county at large, foot up 262,825 acres, paid for, pre-empted and otherwise. \$160,885 worth of brick and \$155,300 worth of frame buildings were erected in Stockton in 1870. The street and sidewalk improvements for the same year amounted to \$83,000. The number of children attending the public schools in this city, according to the annual report of the Superintendent of Public Schools, ending July, 1870, was 2,709; and \$50,312.38 was expended last year for buildings, salaries of teachers, etc., for the convenience of, and educating the same. The mortality for 1870 was 205. The number of marriages for the same period was 162. The number of inches rain fall for 1870 was 7.66. The city contains 3 banks representing an aggregate capital of \$1,250,000.

The secret organizations represented here are the T. and A. M., Independent Order of Odd Fellows, and Red Men; and the order of the Knights of Pythias, are about starting a Lodge here. Of the three former, all are in a prosperous condition and have a large and still increasing membership. The Odd Fellows of this city formed an association in 1867, known as the Odd Fellows Hall Association, and purchased a lot and built one of the finest halls of the kind in the State, which cost \$47,000. In 1867, they borrowed \$22,500, and on Oct. 1st, 1870, they had decreased this indebtedness to \$15,349.83. They expect to clear off the entire indebtedness by June 19th 1873. C. O. Burton, is Pres., Joseph Adams, Treasurer, and T. K. Hook, Secretary of the Association.

Ship Canal—Railroads.

The Stockton Ship Canal Company is a very important association. The incorporators are G. S. Evans, P. Bargion, J. Sedgwick, S. Eldridge, S. Badger, T. K. Hook, G. A. Shurtleff, J. Schrick, C. G. Hubner, J. M. Cavis, Wm. H. Knight, H. H. Bancroft, G. L. Kenney, N. Sposati, C. M. Weber, P. Neistrath, W. S. Moss, N. M. Orr, K. C. Sargent and C. M. Creanor. The Directors are Wm. H. Knight, (President), T. K. Hook (Vice President) C. G. Hubner, (Treasurer), S. Eldridge, and H. H. Bancroft. The grantees of the Stockton Ship Canal franchise, granted by the last Legislature, have assigned their interest therein to the above named incorporators. The project is one of the greatest importance to Stockton, and the people will help it on if they are alive to their interests. I promise in a future article to give an extended account, and to illustrate this with a diagram, (your space permitting,) and in connection with the same, its converging lines of railroads, in process of completion.

At the present writing, about 10 miles of the S. & C. R. R. are finished, to a point where a new town is being laid out, to be called Holdenville. Four miles farther along, on the same road, another town is being laid out to be called Petersburg. Both of these are named in honor of two prominent citizens of Stockton. From Petersburg it is proposed to build three lines, one to Angels Camp, and Murphy's; the main road to extend to Copperopolis and Sonora; and the other branch to Farmington, Knights Ferry, and so on. 40 miles of the iron rail is on board vessels now due at your port.

Manufactures.

The Stockton Woolen Mills, Lambert, Doughty & Tatterson proprietors, have manufactured to date (only recently started) \$10,000 worth of blankets, \$5,000 worth of which have been actually sold. They employ regularly 20 men. The works are run by a forty-horse power engine, with a capacity of running four times the machinery now in operation. The fabrics of this mill are in good demand with the citizens here,

but the lack of funds, to extend their capacity, is the only drawback to introducing their goods to the world at large.

Of tanneries, there are several here, doing, I am informed, a good trade. As yet I have visited but one, that of J. S. Derby, situated on Mormon Slough in the suburbs of Stockton. Mr. D. employs regularly 5 men, and is doing a business of \$20,000 per annum; for nine months of the year he turns out 120 sides per week. Calf, Kip, Harness, Skirting and Sole Leather is his speciality.

The Stockton Iron Works, Farrington, Hyatt & Co., proprietors, manufacture steam engines, iron and brass castings, and regularly employ 11 men. The machinery is run by steam power and is kept busy the year round.

Matteson & Williamson, are the manufacturers of all kinds of plows. They hold the patent-right of the American Chief Iron Sulky Gang Plows, of which they manufactured 120 last year, which they sold for \$11,400, besides numerous and sundry other plows, harrows, cultivators, etc., to the extent of \$25,000, or \$30,000 more. The total amount of manufactured articles by all the different manufactories in iron, wood and tin, in Stockton for the year just ended, was \$1,392,918.

Sperry & Co.'s grist mill, on the corner of Beaver and Leavys sts., is 50x100 ft., four stories high, and cost its previous and present proprietors \$150,000 to erect. For the last four years it has averaged yearly 70,000 bbls. of flour, and 500 tons of ground barley. It is run by an engine of 185 horse power, supplied by three tubular boilers, of 54 inches diameter, 16 ft., long, with 49¾-inch tubes in each; the capacity of this mill is 500 bbls. of flour and 25 tons of ground barley per 24 hours run.

Livery and Sale Stables.—M. Magner, of the "El Dorado," has probably the largest stock of horses, from 40 to 50 head. His principal business in summer is with tourists to the Big Trees and Yosemite. He keeps a register of all tourists, names, which it is quite interesting to review. He has on hand all kinds of imported buggies, carriages, and wagons for sale, having the agency of several prominent manufactories in the East. The "Main Street" stable, kept by Doak & Dunning, and the "Weber" stable, by Beldin & Morris, are worthy of mention, but in the absence of statistics, I must pass them.

The "Yosemite" stable, Geo. Fox, proprietor, was completed in May last, and is one of the finest of its kind in the State. It is of brick, 75x75 ft., with gas and artesian water throughout the whole. It has a capacity of stabling 200 head of horses, and cost \$14,000. Mr. F. has at present forty-six head of horses, fourteen of which are valued at \$500 each and upwards. For his dark bay horse, *Defiance*, he has refused \$2,500. This horse is considered one of the fastest *pacers* on the California turf. Without any attempt to flatter, I think he has the largest number of fine horses and corresponding turnouts in the State.

Fine Stock.

Hiram Drew.—This fine stallion is six years old, a deep cherry bay, with black points, no white, stands 16 hands high, weighs about 1,200 pounds, and shows well for speed, having made a 3 minute gait with 4 weeks training from the biting harness. He was raised in Penobscot Co., Maine, and imported to this State in May last, by W. E. Green, who disposed of a one-half interest to L. E. Yates of Stockton, where he is now kept. He was raised by "Old Drew" of Maine, who was the origin of many fine and fast trotters, among which is the celebrated stallion, McCollan, now in San Francisco; also the Cloudman horse, supposed to be now in New Jersey. Both of these have trotted low down in the twenties. Also grand sire to Little Fred, who trotted in the fall of 1869, at Philadelphia, in 2:21. Of the pedigree of Old Drew, but little is known, except that his dam was a fast trotting mare of English origin, having trotted 20 miles in one hour, subsequent to her bringing Old Drew. The dam of Hiram Drew was sired by Old Eaton, of Maine, out of mare sired by Anson Messenger, he by Winthrop Messenger, and he by Imported Messenger. Old Eaton was sired by the Avery horse of Maine out of a Highlander Mare. The Avery Horse by Massachusetts Messenger; dam, a Morgan mare.

Chieftain.—This excellent stallion is owned by J. H. Dodge and M. T. Noyes. He is 16½ hands high, light bay, black legs and tail, weighs 1,350 lbs., is 14 years old, valued at \$6,000, and is considered among the best of his kind in the State. He is the sire of *Defiance*, the celebrated pacer owned by Geo. Fox of Stockton; also of Grant, owned by Sargent of your city; also of Flora, the trotter.

L. P. MC.

(To be continued.)

MINING SUMMARY.

The following information is gleaned mostly from journals published in the interior, in close proximity to the mines mentioned.

California.

ALPINE COUNTY.

REVIEW.—*Miner*, Jan. 7th: It is in Monitor District that most has been accomplished during the year. Since the Tarshish started up again, a winze connecting the upper and lower works has been completed, and nearly five tons sulphurets concentrated and sold at a good price in San Francisco. Where the lower tunnel intersected the ledge, ore of a fine quality was encountered, and in an intermediate level between the upper and lower workings, the largest deposit of soft ore ever found in the mine, has been lately discovered. Upwards of seventy sacks were taken from one pocket, and of a quality far exceeding anything yet found in the mine. It is expected that a mill will be built in the spring. Had this been done last spring, the mine would now be self-sustaining. The Globe Co. has its mill nearly completed. The developments in the mine are highly satisfactory. Mr. Winchester has bought for this Co. the Chicago & Detroit and Marion properties, and work has been commenced upon both mines. Taking out ore from the Chicago will commence next week, when additional track and a dump shall have been completed. The Monitor Consolidated shows large bodies of low grade ore. The mill will be set running in the spring. The Silver Glance tunnel will open the Tarshish nearly a hundred feet deeper. The Leviathan Co. failed in smelting, but can sell all their ore on dump at \$50 per ton.

AMADOR COUNTY.

KENNEDY.—*Dispatch*, Jan. 14th: This mine will ere long be one of the best in the county. The hoisting works are in running order, and the richest rock is constantly being hauled out.—The mill will be ready to commence crushing as soon as water can be obtained, and pipes are being placed in position.

CALAVERAS COUNTY.

QUARTZ MINING.—*Chronicle*, Jan. 14th: "The darkest days are passed. The old hap-hazard system is obsolete. Quartz mining is reduced to a science. Men who have a thorough knowledge of the business are now placed in charge of mines. The fact that Calaveras contains ledges that can be made remunerative, has been demonstrated. Permanent and profitable mines have been developed in at least three points in the county—Lower Rich Gulch, Angels and Railroad Flat. Confidence in the stability and extent of our mining interests is fully restored."

CEMENT.—The County Assessor's report was accompanied by a letter, from which we quote: About ten months ago, Eaves, Carin, Driscoll & Co. commenced prospecting in the burnt district of San Andreas. At the depth of forty-five feet they were rewarded by a lead of cemented gravel, thirty-five feet in width, and from five to eight feet in depth. Finding the cement to pay with an astra, they put up a wheel and crushing mill, of five stamps. It is now a success, paying twenty-two hundred dollars per run of two weeks. Three other companies have struck the extension.

ANGEL'S.—The same letter has the following on quartz: In the village of Angels are two mines, and about sixteen astras; these are run by water, and pay from three to ten dollars per day, clear. The Stickler mine, on the main lode, is a paying claim; but the owners, not satisfied with doing well, persist in sinking. The Angels Quartz Mining Co. is being successfully worked.

INYO COUNTY.

KEARSARGE.—*Gold Hill News*, Jan. 10th: James O'Donnell, foreman of the Kearsarge Owens River valley, arrived night before last from a trip to the mine. Before leaving he explored the side of the mountain where the Kearsarge is located, and found the ledge, or a spur, at the base, on the creek where the mill is located, upwards of 2,000 feet from the croppings. We understand that it is the intention of Sup. Winters to set the miners at work on this new discovery in a few weeks. Twelve tons of ore from the Kearsarge, believed to be worth \$2,500 per ton, are on their way, which will be submitted to the roasting process, at the Auburn mill, near Reno.

NEVADA COUNTY.

GOOD YIELD.—*Transcript*, Jan. 13th: A crushing of thirty-six loads of rock from the Orleans mine, worked at Stiles' mill, yielded at the rate of \$20 per ton. As this rock was taken out in sinking and drifting, the pay was good.

WATER WANTED.—Same of 15th: The miners are anxiously waiting for rain. There is yet time for winter storms sufficient to supply water enough to extend the mining season far into next summer.

THE EUREKA AHEAD.—*Gazette* Jan. 9th: The dividends paid by the Eureka mine for the year 1870, amounted to \$430,000. The dividends declared by the Amador mine for the same period were only \$155,000.

STARTED UP.—*Grass Valley Union* Jan. 12th: The reconstructed mill of the Empire started up yesterday morning, and was put to crushing quartz. Perfect success attended, and everything worked well. The rock being put through is excellent.

PLACER COUNTY.

GOLD RUN.—*Stars and Stripes*, Jan. 12th: Our correspondent informs us that three of the hydraulic companies at that camp have commenced washing, and if the storm continues two or three days longer there will be water for all.

SIERRA COUNTY.

MILL COMPLETED.—*Messenger*, Jan. 14th: The new mill for the Buttes' mine has been completed and accepted.

HOWLAND FLAT.—*Cor.* of same: Times are rather dull at present, owing to a scarcity of water. The Empire commenced a new tunnel last fall, the old proving too low for working to advantage; they intend to have the new one completed in two years. The Monumental claim is paying pretty well; also the Pittsburgh. The Hawkeye Co. are running an air drift to their shaft, and will have it completed in two or three weeks, when they will have all the air they need. They have very rich ground, and next summer will see it the leading claim in this vicinity. The Barnes Ravine Co. are doing pretty well. The Union Co. have reduced wages to the rate of two dollars and a half per day.

LA PORTE.—*Cor.* Downieville Democrat, January 12th: The Bald Mountain Tunnel Co. have let another contract. The rock has been very soft lately, and they have been making remarkably fine headway.

SISKIYOU COUNTY.

ETNA.—*Yreka Union*, Jan. 11th: The Etna Co. have been taking excellent dirt out of their claim for some time. They are about to commence to wash up the dirt drifted. They have not water to run their hydraulic.

SALMON.—From Mr. Reed, one of the owners of the Black Bear Quartz Co., we learn that the prospects of that section are daily improving. A new mill was about to start on Jackass Gulch.

TRINITY COUNTY.

TRINITY CENTER.—*Cor.* Journal, Jan. 14th: Thomas Coyle has completed his flume to the bank of Trinity river, so that it is now half a mile in length. He is one of our heaviest miners. Whitmore & Thomas, McLeary & Bloss, and Rumfelt & Co., all have No. 1 claims. Yesterday some miners came into town bringing fine specimens of dust from the head of Clark Creek, eight miles from where there was any work done before. One specimen weighed \$28 00, and they showed several of from \$6 to \$8 in weight. They report seven men upon the creek, all doing well and with plenty of water. The gold is considerably mixed with quartz, and the supposition is that there is a good ledge in that vicinity. There are only two companies at work at present.

Nevada.

EIY DISTRICT.

MEADOW VALLEY.—*Cor.* of Pioche City Record, Jan. 12th: The site for the Chicago mill is being graded for the machinery daily expected—Boyden, Supt., telling us we might expect to see the mill in operation in 40 days. Henry Raymond's little 5-stamp mill was cracking away as usual, throwing the silver in sight. The mill of Raymond, Ely & Mee was idle for that day undergoing repairs. The Bowery Co. have finally struck the ledge.

EUREKA DISTRICT.

JACKSON FURNACES.—*Sentinel* Jan. 14th: At no time has the bullion been richer than now, or the furnaces working more freely. About six tons of bullion are produced per day. The ore is almost exclusively from the Jackson mine, in which they have, within a few days, struck a new chamber of much better ore than usual. The greatest depth yet worked is 200 feet, at which working the miners have been unable to drift through it, although 20 feet from the shaft. Six men can get out ore enough per day to make six tons of bullion.

PHOENIX.—This company is pushing work on the Adams & Farren, and have good ore in the tunnel, which has been run forty feet. The assays are high, and there is every appearance that a large body will soon be reached. The same company has also purchased the Empire and Lexington.

BUTTERCUP.—This pioneer Co. is turning out large quantities of bullion. For some days they have been running on Wide West ore, of which they have purchased 80 tons, for the purpose of getting high grade bullion. The ore, with one-third carbonates, smelts as well as any ore in the district.

MINERAL HILL.—The Huber mill is averaging \$2,000 in silver bullion per day, on second-class rock, and this, like the Monte Cristo mill, has a Stetefeldt furnace that is of sufficient capacity to roast 30 tons per day. As soon as it can be done ten stamps more are to be added. The first-class rock will average \$400 per ton. The "Big Sandy" is becoming one of the best mines in the district.

BULLION.—From the 6th to the 12th of January Wells, Fargo & Co. shipped from Palisade, 52 bars refined bullion, valued at \$66,556 60, and the Central Pacific 260,290 pounds of base bullion.

TILTON SMELTING WORKS.—These first fired up yesterday. The furnace, as well as the Home Ticket, was purchased by Hon. S. S. Tilton, of San Francisco, and ten men are now at work on the mine, and teams are hauling ore to the furnace. Home Ticket ore will smelt any ore in the district in the proportion of one half of each.

HUMBOLDT.

CARMONY & SMITH MILL.—*Register*, Jan. 14th: In our last issue we stated that the mill was in full blast with a superior furnace. This furnace we stated was an improvement on the Stetefeldt, which appears to be not the case. We are informed that it is an original invention by Mr. Akin, the Supt.

RYE PATCH.—*Cor.* of Silver State, Jan. 14th: The Butte Reduction Works are in full blast. The Aiken furnace is a complete success, and a decided improvement on anything of the kind yet invented. The company are putting in five more stamps, which will give them a crushing capacity of fifteen tons every 24 hours. The Butte has 1,200 tons of ore on the dump and at the mill. The ore is of a high grade; the second class upon which the mill is running yields \$60 per ton. The Hard Cash Co. are running a water level tunnel which will test the vein a depth of 200 feet. The prospects are very flattering. The Rocky, 300 feet east of the Butte, is a fine looking vein. Ore was struck yesterday, which caused some excitement.

REESE RIVER.

BELMONT.—*Cor.* of Reville, Jan. 14th: On the 12th, at 1 o'clock, Mr. Canfield started up his new 10-stamp quartz mill. Everything went off as smoothly as if the machinery was old and tried. The engine room, under the supervision of Harry Mills, looks like a jeweler's shop. The amalgamation is effected in Freiberg barrels, conveniently situated to the settlers; the latter with the retort and melting furnace being on the lower floor and adjoining the assay office. The roasting is done by means of a Stetefeldt furnace. The rock breaker in the ore room is so disposed as to give a fall from it to the drying floor, in front of the battery. The whole community drank to the health of R. B. Canfield and the success of his mill.

WASHOE.

SAVAGE.—*Enterprise*, Jan. 15th: On the 535-foot level is the new body of ore, now what might be called the backbone of the mine. Its extent and value cannot at this time be calculated, but enough is known to satisfy experts that it is one of the most important strikes made in the mine during the past two or three years. It is a huge body of fine milling ore around which work has been done for years, its existence being suspected by few. They have opened 148 feet in length, and find it to be 24 to 30 feet in width, and throughout it will mill \$23 per ton. A drift is being run from the engine shaft to cut this deposit 100 feet deeper. The new body of ore struck east of the old shaft fourteen days ago, is narrow, but very rich. It is doubtless the old Potosi chimney. The mine is yielding 200 tons per day from all parts.

CROWN POINT.—This mine is looking exceedingly well. The new body of ore in the 1,100-foot level has much improved. A raise 35 feet upon the ore from this level shows the body to be six feet in width. It will mill at least \$45.

HALE AND NORCROSS.—They are opening the eighth level and running a drift on the west edge of the ore vein. The ore is of the hardest blasting character. The cross-cut on the main drift on this level has reached the east clay wall, and shows a width of 52 feet of ore. All the old ore breasts on this level are looking fine. The mine is yielding 190 tons per day, 35 of which comes from the old upper levels.

BELCHER.—Some very good ore is being taken from a winze 50 feet below the 335-foot level, and 80 feet from the Segregated

Belcher line. The streak is three feet wide. In the south-west drift at the 400-foot level, a promising body of fair grade ore is developed, 15 feet wide. Assays average \$45 per ton. The daily yield of the mine is only from six to ten tons at present.

VIRGINIA CONSOLIDATED.—The west drift from the bottom of the main shaft is in 1,107 feet, and the north-west drift 133 feet, toward the old Central. The rock is easily worked. Little water is coming in.

CHOLLAR POTOSI.—The yield during the week was 1,670 tons, 1,580 of which was shipped to the mills. The average assay of the ore extracted was \$76.

OPHIR.—Work in the "up-rise" from the south drift is vigorously prosecuted.

OCCIDENTAL.—This mine will probably start up again within a few weeks. Stockholders are anxious to see work resumed.

OVERMAN.—The Co. are taking out 80 to 90 tons per day. Most of this comes from the 226 and 400-foot levels, and 400 feet south of the main shaft.

GOULD AND CURRY.—About the usual amount and quality of ore from the old upper levels. A considerable amount of prospecting is done.

SIERRA NEVADA.—The mill is running upon good ore and the mine yielding about as usual.

DANEY.—The drift from the bottom of the shaft toward the vein is in 27½ feet. The ground is quite hard. The machinery is all working well.

SEGREGATED BELCHER.—The situation may be said to be unchanged. They are mainly engaged in keeping down expenses.

YELLOW JACKET.—This mine is yielding as usual. All the ore breasts are looking well, and a new deposit has been found which promises well.

GOLD HILL.—*News*, Jan. 14th: About 40 tons of ore per day have been taken out of the old Bowers and Trench mines, in Gold Hill proper, for some time past, through the old Stevenson incline, by Motz, Scale and others, but they temporarily suspended operations day before yesterday; the work will probably be resumed next week. This ore was taken from a depth of about 400 feet from the surface, and is rather low grade. In the old Bowers mine at that depth there is a body of this ore 15 feet wide.

GREAT RECEIPTS.—The Chollar Potosi receipts from ore reduced during December footed up \$505,654.

WHITE PINE.

The *News* of January 14th gives an extract from the assessment roll for the quarter ending with December, showing the amount of ore worked by the principal mines on Treasure Hill, together with the yield of each. We give the figures for three of these: South Aurora, 3,914 tons and 1,000 pounds, which yielded \$126,787 08, Ward Beecher 1,331 tons and 1,930 pounds, which yielded \$37,529 45. Original Hidden Treasure 996 tons, yielding \$20,940 60.

IREMS.—South Aurora is the most systematically worked of all. Between 60 and 70 men are employed. The tunnel is 464 feet in length. Three 50-foot levels have been run eastward, the third being in ore, some of which is as rich as ever came out of the Hill. The mine shows good ore enough to keep the mill running several years. The same Company has 20 men at work on the Cons. Chlor. Flat mines, which it now owns. In North Aurora—the usual force is at work in the Earl and Iceberg, and large quantities of ore are on hand. Ward Beecher—sends 50 tons to the Oasis mill daily, but the dump shows no decrease. The chambers filled with ore waiting for the tramway to be finished. Original Hidden Treasure—is sinking in the shaft, and Professor Clayton is to prospect the mine thoroughly and put in shape for working. Gen. Lee, located in 1868, runs \$50 to \$75 per ton, which will pay now. There is a solid body of ore 14 feet thick. Silver Wave will average \$60 per ton. Silver Wedge shows good indications. Ten tons of Trench ore gave \$408 per ton at the Big Smoky mill. Dominion bids fair to eclipse the Trench. The ore is extremely rich and the body extensive.

MILLS AND FURNACES.—International mill has had steam up nearly the whole week, and has been adjusting the running gear. The mill will not commence active operations until the tramway will be finished, which is expected to be in two weeks. Stanford mill keeps running on South Aurora ore. It will also be supplied by the tramway. Big Smoky mill is doing good work. The roasting furnace, has proved a splendid success. One containing 43 per cent. of lead has been successfully roasted and has yielded bullion which ran over 980 fine. Ores from Kern, Pinto, Mount Ophir, the White Pine range, and other places have been tried, and have

given uniformly good results....Metropolitan and Swansea mills are both running steadily....Oasis is working Ward Beecher ore and will be kept on that until the International starts....Monte Christo mill has been running on ore from Pinto....Alsop furnace is turning out lots of base bullion.

OUTSIDE DISTRICTS.—Clifton ore assays \$100 in silver per ton, and 33 per cent. of copper. There is also free gold visible. Work will be resumed in the spring....The Troy Co., is to have a 15-stamp mill made in San Francisco....In Tem Piute, Judge Thompson has 150 tons first-class ore out of the McKenzie claim. It assays \$100 to \$300. The Monroe has a 12-foot ledge with 3-foot pay streak. It has 20 tons good ore out. The Rattler shows ore of high grade. The Crescent 10-stamp mill will start up about Feb. 1st.

Arizona.

BRADSHAW DISTRICT.—Prescott *Miner*, Jan. 7th: Messrs. Moreland and Taylor report the miners all at work sinking, and that the mines are wonderfully rich. The Del Pasco was increasing in size. Work on other lodes proves that they are rich and permanent. A piece of ore from one of Moreland's lodes, assayed \$1,350 per ton in silver. There are more than fifty well defined quartz lodes taken up.

WICKENBURG DISTRICT.—From A. Barnett, we learn that the Vulture Co. in their lower level, has struck ore so rich, that they considered it necessary to place a guard over it. One wagon load of rock was supposed to contain \$10,000. The mill was running constantly.

Colorado.

NEVADA DISTRICT.—Central City *Herald*, Jan. 7th: Between forty and fifty claims are now worked on Quartz Hill. The Kansas lode is taking rank among the first. Ten claims are worked. Several of these are yielding \$120 to \$180 per cord. Waterman has a large quantity of very rich ore on the dump at the Flack mine. The Roderick Dhu, as usual, is yielding immense quantities of rich ore, keeping 70 stamps in operation the greater part of the times. On Prize Hill, Buck & Co. are obtaining plenty of rich paying quartz from the Commonwealth claim. Jennings & Co. are hoisting ore from a drift on the Central Co.'s claim. C. Hagar has struck "big pay" in the Monitor and is taking out quartz which yields 10 ounces of gold to the cord in stamp mill. The old Rochester Mining Co.'s claims, which have never before paid for working, are now leased by Cornishmen who are taking out seven ounces ore.

GRAND ISLAND.—Register, 11th: Only two mines are producing much salable ore, the Caribon and the Trojan. The former is now eight feet wide in the bottom. Besides the ore sent to the smelting works every day Mr. Cutter is saving a third class that will give 50 oz. by milling. Of this he has 400 tons on the dump, and is adding four to six tons daily. Mr. C. has commenced a tunnel to cut the Caribon at a depth of 400 feet. This, when completed, will be about six hundred feet in length and will probably cut other veins before reaching the Caribon. It is now in 40 feet.

The Wabash is a new lode, discovered by Dr. Mann, 800 feet south of the Caribon. The Doctor has one shaft 15 feet deep showing a crevice of 7 feet with 2 feet of pay ore similar to that in the Caribon. An assay gave \$4,422.60 coin per ton.

BLACK HAWK.—The freeze is over, and nearly all the mills are in motion. At the "Point," the Black Hawk Co.'s mill, 85 stamps, the Eagle, 20 stamps, Stevens Bros. of 14 stamps, and Fitzpatrick's 10 stamps, are working custom ores. Borham & Mellor's 20 stamps are working Gregory 2nd ore. The Polar Star mill is running its 32 stamps. Mr. Mead's is the only mill that did not have to shut down. The rejuvenated Bobtail is running, as well as the Sensenderfer. On Gregory Gulch, the only mill running is the Smith & Parmelee, although the Briggs will start soon. This makes 382 stamps at least that are at work, leaving 400 idle.

Messrs. Root, Hall & Queen are still creek mining. From their new location, 200 feet below the Bull's Head Corral, they are running a bed rock drift from the bottom of the shaft up the creek, and washing everything that comes out.

Idaho.

LOON CREEK.—Idaho *Democrat*, Jan. 7th: C. J. Tassell, expressman, reports some seven hundred people wintering in Lemhi county, two hundred of whom are at Oro Grande. Mining operations are confined to drifting. Mr. T. is confident that the coming season will prove a prosperous one, and that two men will take out dust where one did last year.

New Mexico.

SILVER CITY.—Cor. of Santa Fe Post, Jan. 7th: All seem to be well pleased with the progress and prospects of the mines. Shafts are being sunk, and in no instance to my knowledge has the ore decreased in richness as they go down. The wall-rock is well defined. New lodes are being struck between here and the burros, with plenty of water. We have a good prospect for two quartz mills by spring. A thirty-stamp mill has been ordered by L. B. Maxwell. Carson & Son, of New York, have contracted to have a mill in operation by the 1st of May. Col. Rynerson has an engine and machinery on the road from Mesilla, to run arastras and furnaces. Carrasco & Co. are running their furnace, and getting 50 per cent. profit. We have a new enterprise lately started, called the Eclipse Tunnel. It is in 35 feet, and is intended to strike the Legal Tender and other lodes 100 feet below the surface.

Montana.

PHILIPSBURG.—New North West, Jan. 6: Mr. Ritchie, who has been running the furnaces, does not believe that method of reduction a financial success, and work has been suspended. From Mr. Gerber we learn the mill is running steadily under the management of Capt. Plaisted. He finds ample power to drive all the machinery; is crushing 12 to 14 tons of Hope ore each day, and it yields \$40 to \$50 per ton. He is using 2,000 pounds of quicksilver and retorting every alternate day. Capt. P. has ten men at work on the mine; Duffy & Co., are taking out ore on Comanche No. 3 (Merrill's); and Murphy & Co., are mining on the Irish Republic, and Merrill & Ullery on the Franklin. Three assays from the latter ore by Ferd Kennett yielded \$109, \$194.75 and \$193 to the ton. The camp is quite lively, and Captain Plaisted will be ready in a month to crush custom ores.

PIONEER CITY.—Independent, Jan. 7th: O. W. Hirst informs us that there are seven companies on French Gulch, who are taking out pay dirt. Of course it cannot be washed until spring. One Co. have obtained as high as \$1 per pan in the gravel. All the claims prospect well.

CABLE CITY.—The Cameron Co. are taking out an unusual quantity of ore of fine quality. The mill is run constantly.

MOOSE CREEK.—Parks & Dickey's astras has been closed for the winter for want of water. They have crushed a large amount of ore the past season, the greater part of which has paid well. Their mine (the "Dixie") is developed to a depth of 142 feet, and they are still sinking. They have a vein of three feet, paying an average of \$45 per ton. Day & Harvey's silver ledges, in the same locality, are being worked vigorously, and first-class ore is taken out.

DITCHES.—The Miners' Ditch is nearly completed. The Lost Creek Ditch is being enlarged to a capacity of seven hundred inches, and the Race Track Ditch Co. are constructing an immense reservoir. The Lower Rock Creek ditch Co. are building a dam across Rock Creek, sixty feet long and twenty feet high. All except the last named are new ditches, and have a combined carrying capacity of 3,500 inches.

WEST SIDE.—Helena *Gazette*, Jan. 9th: We learn that mining business generally has been suspended for the winter. Chinamen are buying up ground at Cedar Creek, Elk Creek and other camps on the West Side. Claims that will pay three or four dollars per day are bought up by Chinamen at good prices.

Oregon.

The Idaho *Democrat* says that the El-dorado Ditch, to bring the water down Burnt River canyon, through a line of rich bars a distance of thirty miles, will be of three thousand inches capacity. The work will be commenced early in the spring. Hundreds of men will find lucrative employment in these places. Three hundred men will commence the work as soon as the weather permits.

Utah.

The Ophir City correspondent of the Colorado *Register* writes, Jan. 1st: "The Emma mine, of Little Cottonwood, furnishes from 30 to 70 tons per day, that pays a net profit of over \$150 on the dump." * * At East Canyon is Ophir City, built up since last July. About 500 lodes are already recorded. Up on the hill to the south of us is Silverado. Here are the Silveropolis and the Chloride Point mines; also the New York, Mountain Lion, Zella, and other valuable mines. In fact this is one of the richest districts ever discovered. Here are chloride ores. The mining belt extends for 300 miles southward, to Pahrnanagat.

THE "OUTCULT" ROOFING.—"The patent 'elastic joint iron roofing'—says the Cincinnati *Industrial Press*,—provides for the expansion and contraction of the metal in the most effective manner. Both edges of each sheet are rolled in the form of a scroll at the factory. When one sheet is laid the next one fits closely over it and is held firmly in its position by means of the shape of the scroll. The hollow cylinder which is thus formed on the opposite edges of each sheet gives the greatest strength possible for the weight of metal, secures a perfect dryness underneath without being air tight, and provides for the greatest possible expansion and contraction without injurious displacement. The sheets are fastened to each other at the end by a lap in the form of a hook, and the whole is laid without a nail hole in any part of the roof, as the sheets are successively fastened to the sheathing or rafters by cleats of iron which fit the inside of the scroll and are firmly nailed on."

Mining Stocks.

SAN FRANCISCO, Thursday Eve., Jan. 19.

The mining share market opened weak, on last Friday, but on Saturday there was a reaction, and very considerable excitement on account of the rapid advance of Crown Point, which sold heavily up to \$40. This week, the market was at first quite firm, but grew weak again on Wednesday, through a collapse in Belcher and Crown Point. The following table gives last Thursday's quotations and the highest and lowest points since reached by the several descriptions of stock.

TO MINERS, MILLMEN AND METALLURGISTS. Kustel's new work on the Concentration of all kinds of Ores, and the Chlorination Process, for Gold-bearing Sulphurets, Arseniurets, and Gold and Silver Ores generally, is the best and most complete work issued. It contains 120 diagrams, illustrating machinery, etc., which alone are of the greatest value. Price, \$7.50, postage paid. Published by Dewey & Co., publishers of the Scientific Press, San Francisco.

SUCCESS IN BUSINESS.—Success in the business world usually depend upon being thoroughly prepared for its duties. Young men if you would succeed in your business career, secure a good practical business education. This question being settled, the next is where to go. Why, go to the best, of course. Go to HEALD'S BUSINESS COLLEGE, located in the new College Building, 24, Post Street, San Francisco. This is the only school upon the Pacific coast where young men can depend upon being thoroughly fitted for Bankers, Merchants, Clerks, and Bookkeepers. This school is connected with the "International Business College Association" or Bryant & Stratton chain. Its scholarships are good for tuition in any of the forty colleges, located in all the leading commercial cities of the United States and Canada. There are many interesting features about the school which cannot be discussed here. Call at the College and examine the workings. If unable send for circulars and HEALD'S COLLEGE JOURNAL, which will be sent free upon application. Address, E. P. HEALD, President, Business College, San Francisco, Cal. 23v22-3msn

PHOTOGRAPHY.—For CABINET PHOTOGRAPHS, or Enamelled Cards, of the very best quality, you must go to the NEW YORK GALLERY, Nos. 25 and 27 Third Street, San Francisco. Every picture warranted to give satisfaction. 0v13-6m B. F. HOWLAND

AGRICULTURAL INDUSTRY

Successful Cultivation of the Desert.

The experiments which are now being made under the direction or encouragement of the Kansas Pacific and Union Pacific Railways in the cultivation of the great unwatered plains near the eastern base of the Rocky Mountains, are most encouraging, and lead to confident anticipations of complete ultimate success. These experiments have been undertaken, by the roads mentioned, to prove the practicability of the cultivation of those lands, and thereby give them a market value from which both the roads and the people at large will profit. The few isolated experiments thus undertaken will encourage the settlement of other sections, similarly situated, until the entire stretch of country across the "Plains," bordering upon the railroad lines, will be brought under cultivation and made tributary to said roads.

Success in those localities will lead to similar experiments on this side of the Rocky Mountains, until, in all probability, millions of acres in California, Nevada, Utah, and Arizona, now considered worth less for cultivation, will be made to contribute to the sustenance of our rapidly-growing interior population, and to the general commerce of the country.

Mr. R. S. Elliott, "Industrial Agent" of the Kansas Pacific Railroad Co., has recently submitted a report of what he has done in this direction, from which we condense as follows: Mr. C. seems to have selected three different locations on the line of the road—viz: Wilson Station, 236 miles west of the Missouri State line, and 1,586 feet above tide water; Ellis Station, 66 miles still further west, 2,019 feet above the sea; and Pond Creek, 82 miles still further west, and at an elevation of 3,175 feet.

Only a few acres of ground were broken up at each place, merely sufficient for experimental purposes. Owing to the lateness of the season, the work was not done as thoroughly as it should have been; yet the prospects thus far are most encouraging, and given as follows:

The first planting was done at Pond Creek, on the 26th of September, 1870, when four acres of wheat, three of rye and two of barley were sown—timothy being sown on the wheat. On the 19th of October (three weeks from sowing) the grain was up and doing well, and still doing well on the 14th of November. This experiment is being made without irrigation, in the very midst of the "dry plains," and in a soil the least promising on the entire line of the road—and 240 miles west of what has hitherto been considered the limit of arable effort, depending upon natural rain fall. A second trial upon a thoroughly rotted sod must be far more favorable.

At Ellis, on the 20th of October, three acres of wheat, three of rye, one of barley were sown; on the 22d and 24th more wheat and rye; also various grass seed—Italian rye grass, Lucerne, Alsike clover, Sacin-foin, vetches, etc., were sown. Three weeks from sowing the grain was up, and seen from the car windows as the trains passed; and the Lucerne was forming its third leaf. This experiment is also without irrigation. The fullest success is anticipated; and such a result, it is claimed, will establish the practicability of diversified agriculture throughout the entire region.

At Wilson, two acres of wheat, two of rye, one of barley, and one, each, of timothy and Lucerne, were sown also nuts and

seeds of trees—burr oak, pecan, chestnut, peach and alanthus were planted—all on the 11th and 12th of November. Nineteen days afterwards the grain was up and promising well, notwithstanding the late sowing. Winter wheat was sown in each case.

Mr. Elliott concludes his report with the expression of his belief that forests can also be established in nearly all parts of the plains—even without artificial irrigation, if deep plowing and thorough cultivation are adopted, and rapid growing trees selected for the first planting. Seedling trees at Bunker Hill Station, 252 miles from State Line, and 1,800 feet above the sea, and transplanted trees at Kit Carson, attest the practicability of tree belts, as snow shields, at the cuts along the track.

Wherever irrigation can be made practicable, in comparatively rainless countries, no doubt much better results may be obtained than can be realized from natural moisture.

O'HARA'S PATENT POCKET GIANT CORN SHELLER.

Along the line of the Union Pacific Railroad that company has under consideration plans for an extensive system of irrigation. In Arizona, works for irrigation have been set on foot under the direction of a Federal officer, for which an appropriation of \$150,000 has been made by Congress. In Utah there are already 130,000 acres under a judicious system of artificial irrigation, which are now producing annual crops valued at \$4,500,000. Irrigation is doing much for Colorado. A late number of the *Denver News* publishes some highly interesting facts, showing the trifling cost of irrigation compared with the favorable results obtained, in that Territory.

Every intelligent person is or ought to be aware of what has been done in India and China by artificial irrigation; and notwithstanding the advantages of cheap labor there, a similar plan and scale of irrigation on the comparatively rainless portions of this continent would do equally as much for us. We may not be able to convert our deserts into gardens of paradise; but we can cause flowers and fruits and grains and grasses and trees to grow, wherever water can be made to flow over our arid lands, and thus support large populations, where now all is desolation and waste. What irrigation has done for India, it may be made to do, at least to a reasonable extent, for us on this Pacific Slope.

Thousands of acres along the valley of the Humboldt, and in numerous other sections of what has generally been considered the desert land of the "Great Interior Basin," may, by proper culture and care, be made to yield bounteously of the diver-

sified fruits of the soil. We look upon the experiments now being made in this direction as of the highest importance and most fruitful in promise.

CORN SHELLER.

Our readers will remember that we showed them a device last week, which rendered the husking of corn a light task. We now take another step, and show them an invention which renders the *shelling* easy. The large engraving shows the progressive farmer, who, instead of banishing himself to his cold barn to shell the necessary turn of corn, (for which work he has had no time during the day), and wearing the skin off his hands, in the old way, —has adopted the new device, and now shells by his own fireside, amid pleasant company.

The small cut shows more plainly the construction of the device to which we re-

fer (which is known as O'Hara's Pocket Giant Corn Sheller), and the manner of holding it. It certainly commends itself to the favorable consideration of the practical farmer, who has to do his own work. It is small, light and cheap, is very durable, and enables one to work very rapidly. As evidence of this last, we have the testimonial of a farmer, of Ottawa, Ohio, who shelled 22 bushels of corn in four hours with it on the first trial. Many others might be given. It can be used in shelling for meal or seed with especial advantage, for any part of the ear can be shelled into one measure, and the rest into another, and thus the farmer can at once sort the grains, selecting the larger ones for seed, etc., etc.

Although only about a year has elapsed since the sheller first appeared, it has become very extensively used, 50,000 having been sold in this short time. We have been presented with one, and are inclined to consider it a very valuable little affair, which it is economy to possess. It is cheap, costing but \$1.50—a sum which it will probably save to the purchaser in a short time. It does not scatter, and will shell the largest Indian corn and the smallest pop corn.

Any person desiring further information may obtain it by addressing Chas. M. O'Hara, 114 W. Fourth street, Cincinnati, Ohio; or by applying to Wiester & Co., 17 New Montgomery street (Grand Hotel), San Francisco.

California Agricultural Notes.

LIVE STOCK IN CALIFORNIA.—The number of live stock in California, according to the Surveyor General's Report, (Marin, Plumas, Tuolumne and Shasta not included) is as follows: Neat cattle, 787,771; oxen, 11,345; beef cattle, 300,367; calves, 168,614; cows, 247,603; asses, 1,866; mules, 26,284; horses, 241,146; sheep, 2,975,753.

HOGS POISONED.—The *Snelling Argus* of January 7th chronicles an accident which has many a precedent: "We understand from a gentleman living in the neighborhood of Placerville, that our friend, A. Harrel, present Chairman of our County Board of Supervisors, had the misfortune to lose about fifty fat hogs by poison last week. The poison was phosphorus, put out in adjoining fields to destroy squirrels, gophers and other vermin."

THE CACTUS FENCE is an institution peculiar to Mexico. The variety of the plant used for this purpose is called the organo. It is eight-sided, and shoots up straight as an arrow, from ten to twenty feet in height and five to eight inches in thickness. The fence-builders cut their cactus in sections of the right length, stick the cut into a trench, cover the earth around it to the depth of a foot, and the fence is made. The pieces are set as closely together as possible, and as they take root and grow for centuries, the fence improves with age, instead of going to decay like many other fences.

CASTOR BEANS IN LOS ANGELES COUNTY.—The *Los Angeles News* says that the raising of castor beans is attracting something of attention hereabouts. Several farmers, who last season cultivated a few acres, have met with results that have been eminently satisfactory. In this section the crop must undoubtedly prove a profitable one. The plant will thrive upon soils that are too dry for many other products, and the cost of cultivation is said to be less than for the same number of acres in corn. A ready market, at remunerative rates, is always open.

LARGE FLOCK OF TURKEYS.—A man in the lower part of Placer has had a flock of turkeys numbering fifteen thousand, and has employed five men in herding them.

MERINO SHEEP.—A drove of 98 Spanish Merino sheep, selected from the best flocks in Vermont, were shipped to California overland a few days since.

CATTLE are perishing in Douglas county, Oregon, for want of feed.

TALL GROWTH.—Lombardy poplars, says the *San Jose Mercury*, grown from the slip, in this valley, the past season, have attained the height of fifteen feet.

NEW CROP OF ORANGES.—By the last steamer from Los Angeles, about 55,000 oranges and lemons, of the new crop, were received. The quality is, as usual, better than that of any others brought to this market, though not as good as they will be a few weeks hence.

SHEEP FROM LOS ANGELES.—The steamer *William Tabor* brought up 1,000 sheep from Los Angeles, one day last week.

TO PREVENT balls of snow on horses feet, let the hoof and fetlock be well cleaned, and then rub with soft soap previous to their going out in snowy weather.

Eastern Agricultural Notes.

CASTOR BEANS—REMARKABLE GROWTH.—The editor of *Howe's Monthly*, St. Louis, Mo., has raised the past season a castor bean plant which was 12½ inches in circumference at the ground, and 15 feet 3 inches high, and the aggregate length of the branches was 90 feet 8 inches; so that the whole longitudinal growth of the main stem and branches was 105 feet 10 inches. The branches were evenly distributed along the length of the stem, giving the tree (for such it may be called) a very symmetrical form.

APPLES.—Seventy-five bushels of apples, of fair quality, were recently sold by auction in Grafton, Vermont, for one cent a bushel.

AN ACRE of land near Newport, Rhode Island, lately sold for \$5,393.40.

THE RHINE VINTAGE.—The vintage of the Rhine for 1870 is a failure. German superstition avers that every year written with a cypher at the end is a fatal one for the vintage. The wine in 1860 was anathematized under the epithet of "Garibaldi," and that of 1870 will doubtless be cursed in the name of "Napoleon."

A MAN in Maine has a cow that in a twelve-month made as many pounds of butter as there are days in a year, besides fattening a calf to 1102 pounds.

POPULAR LECTURES.

Vaporization and the Elastic Force of Steam.

[Prof. JOHN LECONTE before the MECHANIC ARTS COLLEGE, Mechanics' Institute Hall, S. F. Reported expressly for the PRESS.]

Physical Science.

LECT. I., Jan. 14th. In commencing this series of lectures, the Professor made some introductory remarks with reference to the branch of knowledge to which the lectures relate. Physical science, he said, treats of the phenomena of matter, of the external world, in distinction from the phenomena of the internal consciousness. Attention should be paid to the meaning of the term "law" in physics. The word was originally borrowed from civil and moral life, and then applied to physical facts. In morals, we understand laws to be rules laid down for the government of rational beings, and in accordance with which we ought to act. But natural laws are the rules, not according to which nature ought to act, but according to which she does act. If we find deviations from a supposed rule, this is proof that it is not a natural law. In this sense, it is absurd to speak of violations of the law of nature. The mixing of these two meanings of the term has given rise to much sophistical writing.

Physical Science is a science founded on observation and experiment. By observation we mean the careful scrutiny of what is going on in nature; by experiment, the artificial reproduction of these facts. The latter aids very materially the former, so much so that a science where experiments are possible, advances much faster than one where this is not the case. On this account, meteorology progresses very slowly. Climatic changes are so connected in all parts of the world, that we cannot expect very great advance here until all portions of the earth communicate by the telegraph, so that we can know of the meteorological conditions everywhere. Again, astronomy made but slow progress until it became a branch of mathematics, when it advanced more in 50 years than it had done previously in 2,000. The reason is obvious. When the phenomena are complex, we can divide them up into their factors by experiments, and study out the causes one by one.

The sources of errors in experiments may be classified under four heads. 1st. Those arising from the imperfections of our senses, which often tend to mislead; 2d. Those from the imperfections of our apparatus. These two classes of errors can be avoided in great measure by proper care and study. 3d. Those caused by our temperaments. Thus, in astronomical observations, it has often been noticed and acknowledged that a person of sanguine temperament is apt to anticipate, and one of lymphatic temperament to delay, the moment when, for instance, a star crosses the lines of the telescope. 4th. From a want of conscientiousness, a tendency to see things as we want them. In the present state of physical science, hardly any one would designedly state that he saw things which he did not see, yet the views of many are modified by their pre-existing ideas, by partiality, combativeness or bad temper.

Although observation and experiment supply facts, yet they do not make science, for science is not a mere collection of bare facts, but facts classified and reduced to order.

Physical science is necessarily connected with the science of numbers; all physical facts are capable of measurement. Hence this science demands a knowledge of at least the elements of mathematics. But for this reason,—as the human mind is not satisfied with the mere knowledge that, or what, a thing is, but desires to know how much it is,—physical examinations carry much satisfaction with them.

Physical science does not investigate the essence of things, does not tell what heat or gravity or electricity is (the function of metaphysics), but what heat or gravity or electricity does.

Boiling—Evaporation.

The lecturer, after these introductory remarks, proceeded to speak of the immediate subject of the evening. All are familiar with the fact, he said, that, in applying heat to water, alcohol, ether or like bodies, vapor is generated, with a distinct elastic force, in the body of the liquid, which vapor rises and causes that movement in the liquid which is called boiling. All know, moreover, that such liquids will generate

vapor, without boiling, on their surface, which action we call evaporation. In most liquids this will occur at all temperatures. It has often been observed that snow disappears from high places even at 20 or 30 degrees below zero, and laundresses know that the wet linen will get dry although it may be so cold that the water is frozen on them. Now boiling takes place at certain fixed temperatures, as at 212 degrees, Fahr., for water, or at 176 degrees for alcohol, while evaporation occurs, as before said, at all temperatures. The term *vaporization*, as used in these lectures, will include both boiling and evaporation.

The first point to be now considered is,—whether there is any limit to vaporization; whether we can make a liquid so cold that it will not give off vapor. Dalton and Sir Humphrey Davy adopted the idea that every body, even metals, give out vapor. Biot applied this idea in his theory of meteorites, supposing that through electrical agency the vapors of metals were collected and condensed, and the meteoric stones were thus formed. But Biot's theory has been proved entirely false.

Experiments about Evaporation.

The vapor theory alluded to has also been disproved. Bellini suspended, from the cork, a strip of bright polished zinc in a bottle over a little sulphuric acid. If the sulphuric acid always gave out vapors, these would of course attack and oxidize the surface of the zinc. But Bellini found that by proper care he could keep the zinc bright a long time; he did so for two years. Faraday made a similar experiment, suspending gold leaf in a bottle over mercury. At a temperature of 80 or 90 degrees, Fahr., vapors given off amalgamated the gold, but by reducing the temperature, the amount amalgamated was reduced, and at 60 degrees no amalgamation took place, therefore no vapors were given off by the mercury. Many other experiments made in a similar way with other substances showed the same apparent results—that by reducing the temperature sufficiently, no vapors were given out by bodies which vaporized at higher temperatures.

In 1854, Brame attempted to re-investigate the whole subject. He suggested that the above experiments did not disprove the existence of vapors, as perhaps these might still exist (at the low temperatures given) but in a state of such tenuity that they could not attack the bodies experimented with. So he took much more sensitive substances, and repeated the experiments, using, as a very delicate test, iodine and chlorine. Although his results did not always agree with the exact limits of temperature before obtained, yet they tended to the same general result,—that at sufficiently low temperatures no trace of vaporization could be found. He noticed one interesting fact in his studies—that at a certain low temperature the vapor rose, say, an inch above the body experimented with, and above this height no vapor could be discovered.

Most liquids evaporate, we said before, at all temperatures which we can obtain. But as we reduce the temperature, the amount of vapor given off decreases, and analogy (although analogy must be very carefully employed) would lead us to believe that none would be generated, if we could get a sufficient degree of cold. Thus, by using mathematical formula, we can calculate that water will not evaporate at 344 degrees below zero; but the lowest temperature we have ever obtained is 228 degrees below zero.

Cause of Evaporation.

Two wrong ideas of the cause of evaporation have been held. One was that this was caused by the water being dissolved in the superincumbent air. This idea, first suggested by Hamburger, in 1750, was adopted by eminent men, Halley, Le Roy, Dr. Franklin, Dr. Hamilton, of Dublin, and others, and by it many phenomena can be explained apparently. Thus, the wind blowing, evaporation goes on faster, for fresh air is constantly being brought in contact with the water. Heat increases evaporation, for hot air would dissolve more water, etc. The second idea was, that the superincumbent air absorbs moisture from the water like a sponge, and this too would appear to explain many facts.

But after a while, a blow was given to these ideas by the discovery that evaporation will go on *without air*. The true theory of evaporation was published in 1802, by John Dalton, of England, and his experiments to prove it can be here repeated.

Simple Experiment.

We have here a number of long glass tubes, closed at one end. One of these tubes we fill completely with mercury, invert, closing the open end tightly with the finger that the mercury cannot run out nor air enter, and insert the end closed with the finger in a bath of quicksilver. Now, on withdrawing the finger, the mercury falls a little distance, until the pressure of the column of quicksilver in the tube balances the pressure of the air on the bath. This apparatus is then a barometer, and the space over the mercury in the tube is of course a vacuum, for no air can be there. If we apply heat at this point, the level of the mercury will not be changed. In the accompanying cut, this tube is denoted as tube 1.

Now we take a similar tube, nearly full of mercury, and add water until it is quite full. Closing the open end, inverting and placing in the bath as before, the water rises to the top, but the space above the mercury, instead of being smaller (for water weighs only about one-fourteenth as much as quicksilver) is much larger, as denoted in the cut by tube 2. Now this cannot be caused by the (inferior) weight

of water. It must be that the water has changed, in part at least, to vapor, the elastic force of which presses down the mercury. No air can be there, and this proves that the presence of air is not necessary for vaporization. If we beat the upper part, the mercury is forced down still lower, giving additional proof of the presence of vapor.

Repeating this experiment in tube 3 with a little alcohol in the place of the water used in tube 2, the mercury is depressed still lower; and in tube 4, with ether, it rises only a short distance in the tube. Now if we should heat the spaces in tubes 2, 3 and 4, to the boiling points of the liquids used, what would be the result? In each case the mercury column

would be lowered until its top was on a level with the mercury in the bath.

These simple experiments, then, disprove wholly the two theories just spoken of, for they show not only that the presence of air is not necessary for vaporization, but that its absence—a vacuum—*aids* vaporization.

The True Cause

of vaporization is the repulsive force of heat overcoming the feeble attraction of the particles of substances.

These experiments of Dalton's, moreover, enable us to measure the elastic force of the vapors at different temperatures. If we use a graduated tube and place it in a larger tube, having the space between the two filled with a liquid heated to different degrees, we can thus measure the elastic force up to the boiling point. We can also measure the weight of each cubic foot of water for different temperatures. This we can also find for other substances. For the weight, we have the proportion,—the elastic force at 212 degrees (found by experiment) is to the elastic force at the temperature desired, as the weight of steam is to the required weight. In these ways indicated, we find the values given in the following table for water vapor.

Temp. Fahr.	Elastic Force. In. Mercury.	Difference. In. Mercury.	Wt. of cu. ft. of vapor in grs.
30°	0.167	1.969
40	0.248	0.081	2.862
50	0.361	0.113	4.089
60	0.518	0.157	5.756
70	0.733	0.215	7.992
80	1.023	0.290	10.949
90	1.410	0.387	14.810
100	1.918	0.508	20.790
212	29.922	257.16

Law of Elastic Force of Vapor.

Many formula have been given for reckoning the increase of this elastic force at increased temperatures. Dalton suggested an increase by geometrical progression, which is perhaps near enough for the small ranges, but not for the larger ranges, as can be seen by making calculations and comparing the results with the differences given in the third column of the above table. The lecturer spoke at considerable length on the topic, and showed how drawing curves on paper to a given scale, and comparing those found by experiment with those according to any given formula or ratio, would aid in getting accuracy in this matter.

The study of vaporization at low temperatures shows two things,—that all volatile liquids vaporize instantaneously when put in a vacuum; and that, at the same temperature, the vapors of different liquids have different elastic forces. Dalton proposed another law which is pretty nearly true,—that different vapors, at temperatures equally removed from the boiling points of the generating liquids, have nearly the same elastic force.

NAPA TWENTY YEARS AGO.

Napa City, Jan. 2d, 1871.

EDITORS PRESS:—Nearly twenty years have now passed away since I first visited this beautiful valley. In May, 1851, in company with some friends, I started for a visit to the Gysers. We gathered additions to our number on our route through the valley, and the second morning after we left McDonald's we were fourteen in number, all well mounted,—a genial set of ministers, teachers and doctors, with two old hunters acting as guides. The sexes were equally represented—there being seven couples, if the writer is mated with the infant Ann McDonald, then in arms.

Wonder what has been her history since?

At this distance of time, I clearly remember many pleasant incidents of that trip. The luxuriant growth of wild flowers, oats and peas; the vivacity and gallantry with which the younger gentlemen vied with each other in plucking the first of some new specimen of wild flowers, as a present to the fair lady accompanying.

Then the herds and herds of deer, seen in the course of that morning ride, and the three grizzly bears which our guides brought down, within an hour's ride of Mr. McDonald's, will serve as samples. A spare rib from a half-grown bear, and a saddle of venison, taken a little farther on, gave proof that we should not lack food in the wilderness through which we were passing. We spent the night at the Gysers; camping under a magnificent buckeye on Professor Shepard's claim. We hoed his patch of corn and repaired his fence.

We were delighted with our trip and unanimously resolved to come again next year, and stay at least a week on the grounds; but I have not been there since. At that early day a few pioneers had made experiments in tilling the soil. Mr. Younts had made a beginning; Mr. Hopper had a few acres of wheat which gave good promise of an abundant yield; Mr. Richie, whose two daughters were in our company, and Mr. Kellogg, with his thousands of vines, are among the names which still linger in memory.

What a change has been wrought in twenty years! Now I propose to go through this valley again, and make note of the prominent industries and to gather facts for publication in the "PRESS." You need not head these letters "All about Napa," for it may not be best to give you *all*, even if I were able to do it. Neither am I quite sure that all of what I may write will be so strictly confined to my text, as to merit that title. Well, so much for a preface and by way of getting my hand in again. In my next I shall proceed straight to business and give you "Something about Napa." J. R.

A NEEDLE IN A WOMAN'S HEART.—In the post mortem examination of Mrs. Margaret A. Jones, of New York, who was recently killed by her husband, Dr. Beach found a needle imbedded in the fleshy part of her heart.

POISONED BY EATING BUCKWHEAT CAKES.—Fifteen men were poisoned right unto death, recently, by eating buckwheat cakes—the cause, as examination proved, being that deadly night-shade berries had been unintentionally ground up with the buckwheat.

CONCORD COACHES FOR AFRICA.—A Concord, (N. H.) coach-maker is building six coaches for use in the diamond region of South Africa.

THE TOMATO is supposed to be a modern fruit, but it is mentioned in a book printed in London in 1,600 as having been long known.

NOTABLE BEGINNINGS.—California records for 1870 will include three memorable industrial events—the shipment of the first bale of home-raised silk; the raising of the first successful crop of cotton, leading to the planting of several large tracts of that staple; and the first success in the manufacture of beet sugar.—*Bulletin*.

WHO OWNS THE REAL ESTATE.—It has been estimated that there are nearly six million owners of "Real Estate" in the whole Union—and of this number more than two-thirds are the Farmers of the Union who are the free-holders of the soil of our Country.

A SMART GIRL.—The Antioch Ledger says, Agnes Lewis, a girl of sixteen summers, has plowed over 100 acres of her father's ranch near Antioch, driving six horses attached to a three-gang plow.

MARTIN FRATIN, the champion hunter of Siskiyou county, Cal., has killed during the present season 67 deer and 9 bears.

HOUSEHOLD READING.—Dried Beef; Soups; Poison; Biliousness; Cloves; Household Receipts; Mechanical Hints; Life Thoughts, etc.....	43
Mining in Venezuela.....	44

A New Mineral—Metacinnabarite.

We have been shown a pamphlet (a reprint from the *Journal für Praktische Chemie*) concerning the occurrence of amorphous sulphide of quicksilver in nature, written by Dr. Gideon E. Moore, who will be remembered by many of our readers here and in Washoe. As far back as 1853, Prof. Whitney noticed, at the Redington mine, Lake county, a black mercury mineral, which was thought to be an isomorphous mixture of sulphide and selenide of quicksilver analogous to onofrite. Dr. Moore has analyzed the mineral, and comes to the conclusion that it is black sulphide of quicksilver which has never been known before except as a product of the laboratory. The following comparison of the red sulphide (cinnabar) with the black will show the chief points of difference: Red,—crystallized or crystalline, perfect cleavage, diamantine lustre inclining to metallic in dark-colored varieties, cochineal-red color, scarlet-red streak, $G = 8.1$. Black,—always amorphous, no cleavage, metallic lustre, grayish-black color, black streak, $G = 7.7$.

The characteristics corresponding so well with the amorphous sulphide of the laboratory, Dr. Moore has ventured to consider it a new species (as in the case of graphite and diamond), and names it metacinnabarite. It occurs in considerable quantities in the Redington mine, generally on iron pyrites, and with small cinnabar crystals on it. The Doctor presents the following theory of its formation:

The pyrites were evidently first deposited, perhaps from solution, for they form a layer on which the mineral rests. Mercury vapors entering a cold chamber, thus lined, condense not to the red, but to the black modification, as shown by Fuchs' method for preparing this artificially. When the temperature is raised, the red modification commences to form, and so we find the cinnabar crystals on our black metacinnabarite.

SHASTA LAND OFFICE.—The President has appointed Chas. McDaniels surveyor of the land Office established at Shasta. Our northern friends will now have better accommodations in land surveys and completion of titles.

Railroad Matters.

It is stated that, during 1870, 6,000 miles of railroad were built in the United States. Illinois leads off with 1,371½ miles built and 366 miles more graded. The Northwestern States alone laid 3,984 miles of track and graded for 2,000 miles. The *Bulletin*, commenting on these figures (which are from the *Chicago Railway Review*), adds that track has been laid, in general figures, for 40 miles on the California and Oregon Road, 20 on the San Joaquin Valley, 42 on the Vallejo and Marysville, 30 on the Southern Pacific, 18 on the Los Angeles, Wilmington and San Pedro; 15 on the Petaluma and Santa Rosa; 3½ on the San Rafael and San Quentin, 3½ on the Stockton and Copperopolis; total, 172 miles. Besides this, considerable grading has been done. Oregon has built about 100 miles, and Nevada 35.

The affairs of the Northern Pacific Railroad seem to be getting into some tangible shape for the public. Work on the eastern end is being pushed. The company have purchased the St. Paul and Pacific Railroad, which is finished some 300 miles in Minnesota, and now have two branches, to St. Paul and to Duluth, which unite in Western Minnesota. On the Duluth branch, track is being laid at the rate of one to two miles per day, we are told, several thousand men being employed. From this junction a third branch, to Pembina, on the British border, is also to be built. The main line runs west from the junction, through Central Dakota, and on this about 100 miles are graded and 40 miles of track laid. Through Montana, the Yellowstone Valley is to be followed, says the *Gold Hill News*, and near the Idaho boundary the road will branch again, 'one line following the Columbia to Portland, and the other striking directly across the Cascade Range to Puget Sound.' We presume that this means that the Snake River will be followed by the southern branch. On the western end we have the promise of speedy work, arrangements having been made and contracts let for the part of the road from the Columbia to Puget Sound. One terminus is at the new town of Kalama, on the Columbia, about six miles from the mouth of the Cowlitz River, and will follow this last river for some distance (a large force is now at work preparing this part) on the line to Olympia, if Olympia is to be the favored spot. We see that a Branch Railroad Co. has been incorporated at that place to "connect with the Northern Pacific at the nearest point." The Pacific Rolling Mills of this city have a contract for as many rails as they can furnish, and the rest are to come from New York, 2,500 tons having been already shipped.

The Central Pacific branch, otherwise the California and Oregon, is completed to Sesma, opposite Tehama, and trains were to have been running to this point. It is said that there is some doubt as to whether the road will cross the river here. The rainy season puts a stop to the grading and to the surveys. The last were stopped on the 6th ult., we believe, when we heard of the parties at Yreka. The *Union* of Dec. 7th says: Mr. Hood does not think the main line of the road will ever pass through Yreka; the expense of constructing it from here to Cottonwood would be enormous, while the cost of building it on the line run through Shasta Valley will be extremely light. These considerations make him think the Shasta Valley route will be selected.

Oregon seems to be determined to have other roads. The conflicting interests of the old West-side and of the Wallamet Valley Railroad Companies have been settled, and the building of a road on the west side of the Wallamet is reported to be certain. The subsidy of \$100,000 for this road has, however, been refused, but subscriptions are said to be made in amounts which secure its terminating at Portland.

The last spike on the road between Santa Rosa and Donahue was driven on the 11th ult., and on the next day the first locomotive ran over the road. On the 31st the opening of the road was formally celebrated, a party from San Francisco going up to participate in the festivities, which passed off quietly and pleasantly. Work was commenced on the road August 16th.

The California Central is a new road to be built from Benicia to Red Bluff, through Solano, Yolo, Colusa and Tehama counties. The company are said to have accepted from Benicia a grant of 1,200 lots, 75x100 feet each, in that town. A surveying party

commenced work at Red Bluff on the 7th inst.

On the short route between Sacramento and San Francisco, work was commenced Monday last, says the *Vallejo Recorder*, of Dec. 29th, on the route near the line of the Benicia and Suisun Wagon Road. It is suggested that it will be possible to find a proper route through the Moraga Valley (back of Oakland). The *Pacheco Gazette*, of the 7th inst., says: The corps of Central Pacific Railroad surveyors are still engaged with their work in the vicinity of Pacheco, and are likely to be for some weeks yet, as their instructions require them to examine every possible pass for the shortest and best route between the Suisun Bay shore and Oakland; and to make accurate surveys of such as do not exceed a grade of 30 feet to the mile.

The Central Pacific having launched their steamer *Thoroughfare*, goods are now transferred directly from their large pier (running from Oakland Point) to the Second street cut. This enables them to transport goods to loaded cars directly from China and Japan steamers, and is otherwise most convenient.

The San José and Alviso Railroad Co., according to the *Patriot*, have already made a beginning, by surveying the line from the city to the bay, and the determination is expressed to push the work forward to completion as rapidly as possible. The *Patriot* understands that sufficient capital has already been secured, and trusts that the road may soon be in operation.

The Stockton and Copperopolis road has had another revival, this time a permanent one, we may hope, the California Pacific people taking a hand. The old incumbents having been cleared off, the inauguration of the road, or the part about 3 miles long laid to the city point, was celebrated at Stockton on December 15th. Over 14 miles were graded and about 8 miles of track laid a couple weeks ago. The *Independent*, of the 16th, announced that the grading had been suspended until the surveys are completed and the exact route definitely fixed. There is some talk of extending the road hereafter in both directions.

There have been rumors of another change in the route of the San Joaquin Valley road. In regard to the route of the Southern Pacific south from Gilroy, the *Sacramento Record*, some time ago, suggested the following: The third, and the one that likely has been selected, is that from Gilroy through a pass in the mountains to the Salinas Valley, Monterey county; up the Salinas to the boundary line of this county; thence to the Paso Robles Hot Springs; thence through a pass to the Santa Lucia Mountains to the Morro; thence through the Osos Valley; thence down the coast to the Arroyo Grande; thence to the Huasung; thence up the Santa Maria river, through San Buenaventura Pass, to the coast; thence to the city of Los Angeles; thence down the coast to San Diego; thence through Warner's Pass through the most fertile and populous portions of Southern California.

The Stockton *Republican* says that the people on the west side of the San Joaquin River appear to be in earnest in reference to having a railroad up the valley, to terminate at Antioch. A public meeting was held at Ellis, lately, for the purpose of organizing a company to build the road. A gentleman who had been over the route explained to the meeting that Antioch could be reached in an air line, distance twenty-eight miles, without grade or obstruction of any kind, and would pass in close proximity to the coal mines. The requisite number of shares to obtain the franchise was subscribed and the right of way was given.

The suit between the city of Los Angeles and the Los Angeles and San Pedro Railroad was dismissed last month, there not being "least cause for bringing a suit." The business transacted by this road for the past year—giving an approximate idea of the whole business of this district—aggregates 7,050 tons of exports, including 283,000 gallons of wine and brandy, 7,000 bales of wool, 32,000 sacks of corn, barley and rye, 16,000 cases of oranges and lemons, 5,000 hides, and 2,000,000 lbs. base bullion. The imports were 10,600 tons, exclusive of 6,000,000 feet of lumber.

The California and Arizona R. R. Co. have petitioned Congress to subsidize their proposed (narrow-gauge) road from Wilmington, Los Angeles Co., to Wickenburg, Arizona, with a branch, from some convenient point on the trunk to Owens' River, striking that stream about 50 miles above Owens' Lake, and having a total length, inclusive of branch of 500 miles. Their petition treats of the mineral resources and traffic of the country and states that the track from Wilmington to Owens' River, via Los Angeles, now gives con-

stant employment to 50 ten and twelve mule teams, over a heavy, difficult road, about 275 miles long, and the weight of the bullion transferred largely exceeds that of the supplies furnished. With a railroad, large quantities of ore could be profitably sent from the mines to be smelted at San Francisco. The petition was presented to Congress on the 6th inst., and was referred to the Committee on Public Lands and ordered printed.

[Concluded next week.]

Hotel Life in '49.

We have received from A. L. Bancroft & Co., 721 Market street, an interesting volume,—the History of San José and Surroundings.* The book is pleasantly written, and forms a valuable collection of facts concerning the city of San José and the valley of Santa Clara, one of the richest of vales, and one which contains the most ancient Pueblo in the State. A hasty perusal of pages here and there calls to mind many facts forgotten and brings up many reminiscences of similar events. We give an extract concerning hotel life, which is not entirely unknown even now in some parts of our coast.

The principal hotel of San José, the City Hotel, was a frame building, one and a half stories high. The table was remarkably good,—equal to many of the present day. Vegetables were the scarce articles. Although very good, the boarding was expensive. The price was five dollars in gold per day; that is, board and lodging. The sleeping apartments were not equal to the eating; in fact, the house was not sufficiently large to accommodate one-half, nay, one-fourth of the boarders; the dining-room and bar-room floors were used to stretch out the weary eaters at night; not only occasionally, but regularly as the night came, and no deduction of price was made because a boarder was kind enough to get so low down. Whether a man had rested on the floor, or on the best bed in the house, he soon found that, although not caring much for a great deal of, or very elegant furniture, yet he did deem it absolutely necessary to have about him a pocket-comb; and when he was about to purchase that article, he never for a moment doubted whether to take a fine or coarse one. He found joint-tenants in that house, which claimed and took possession, though not registered; nor could they be ejected by the law, except the law of self-preservation. If a man scratched his head, nobody for a moment supposed it was for an idea. If there were no ideas running in his head, there were other subjects that attracted his attention. It was a hazardous undertaking to attempt to eat at the first table; the rush was so great, that crowding through the dining-room door put one in mind of trying to drive a four-horse team through a single door of a stable.

A dinner cost two dollars, a good bed for a night's lodging the same; but one could obtain a cot, or bunk with blankets, one night, for one dollar. Eggs were worth 50 cents each, vegetables of all kinds were scarce and high; potatoes were the principal vegetables eaten, and the only class that appeared to be found at all times; a few onions at 25 or 50 cents each could be had. Beef and mutton were the only meats, with the exception of, now and then, chickens, wild duck, rabbit and squirrels, at high rates.

* With Biographical Sketches of Early Settlers. By Frederick Hall. Illustrated. A. L. Bancroft & Co., S. F., 1871. 800 pp. 537.

LEADED.—From thirty to forty men are now lying on the broad of their backs sick, owing to being leaded, caused by working in the mines of this district. The peculiarity of the mines here are that men on an average cannot work over twenty days in any mine or mill in this district without suffering from an attack of leading. Whether this is caused by foul air or like cause we have not ascertained for a certainty, but judge that it is owing to the peculiar kind of rock or ore which they work. Miners will have to use the utmost care in keeping regular in their habits of all kinds, and when an attack starts in, let them start in with the doctor's advice immediately. By observing the necessary caution they will save themselves many a day of suffering.—*Pioche Record*.

WE have received from Bradloy & Rulofsou, photographers of this city, a photograph of Wm. Halford, the only survivor of five persons who sailed from Ocean Island to Honolulu, a distance of 1,500 miles, in a small boat, to obtain succor for the U. S. steamer *Saginaw*, lately wrecked.

The Thompson Road Steamer.

On the 10th, Tuesday, a rather strange-looking affair might have been seen traveling along the railroad bridge of the C. P. R. R. at Oakland Point, and backing, turning and progressing over the sandy streets of our sister city. The Tide Land Reclamation Company had taken their Thompson Road Steamer from the U. S. bonded warehouse, and sent it across the Bay, where it is soon to be tested as to its powers and capabilities for plowing. The evolutions gone through on this occasion, were principally to satisfy the curiosity of a few persons, and to "give a ride" to a few privileged individuals, among whom was one of the proprietors of the Press.

This steamer, the first on the coast, has been brought hither through the enterprise

of 8 and of 12 horse power, which draw loads of 20 and of 30 tons, respectively, on an ordinary level road, and 12 and 17 tons up inclines of 1 in 12. The speed is $2\frac{1}{2}$ to 6 miles per hour for freight steamers, and 10 miles for passenger service. The consumption of coal is about $\frac{1}{2}$ ton daily. The prices are \$5,000 and \$6,500 at the works in New Jersey. All the steamers can be fitted so as to work as stationary engines for driving any kind of machinery.

An important feature of this machine, especially important for our coast, is its ability to run over sandy and rough ground. This was shown well at Oakland, and has been proved elsewhere in many cases. Indeed, not only does it travel over soft roads without injuring them, but it actually repairs and improves them. Some artillery officers, says the London Times, were

making six trips daily from Aberdeen, Scotland, to some flouring mills, three miles distant, and carrying a load of ten tons each time. The road on which it travels is described as "perhaps the worst road in the kingdom," being narrow and crooked, and with gradients for one-half the distance varying from one in nine to one in eight. Up these inclines the steamer, which weighs six tons, takes in tow a load of ten tons. It may help to realize what one in eight represents, to mention that the steepest grade over the Simplon pass, in Switzerland, is one in thirteen. This case will fit many of our mining conditions.

Last Saturday, the steamer was taken out by Mr. Roberts, for a little trip over the worst roads and across fields, and was attached to the plows in one case, where

Notes on Contributions to Our Cabinet.

We have received from Mr. Chas. A. Aaron several interesting specimens, Nos. 514 to 517. These come from Blind Springs District, Mono county, and the "rebellious" ores which they represent are worked successfully in accordance with the method denoted in the work of Aaron and Mack on the treatment of so-called rebellious ores in the district mentioned.

The specimens marked with the above numbers are all varieties of Stetefeldite. One is quite a characteristic specimen, while another contains, mixed with it, quite an amount of galena. Another specimen is yellow and earthy, and is probably principally antimoniates of lead (and silver), and merely a Stetefeldite which has been decomposed to a considerable extent. It

THOMPSON'S RUBBER TIRE TRACTION ROAD STEAMER.

of Mr. G. D. Roberts, President of the Tide Land Reclamation Company, who is not slow in going for a good thing when he sees it. With the steamer was sent a gang of eight heavy plows, with the necessary machinery for operating them.

We have previously given a description of this engine, and the results of experiments in drawing plows, etc., at Paterson, N. J., some weeks ago. We are now able to give an illustration, which will convey a clear idea to the reader of the looks of the steamer. The important feature of the rubber tire, with its enclosing endless-chain of steel plates, will easily be understood from the cut. This chain, the rubber tire, and the rim of the wheel they enclose, have no connection with one another. This is an item of very considerable importance, and to it is due in great measure the indestructible nature of the tire; for in running, especially with a heavy load, the tire slips gradually around the wheel, and this slip saves it where a very sudden and exceedingly great strain might tear it.

The steering apparatus is simple, and the steamer can be turned very sharply, its inner driving wheel describing a circle of a radius less than three feet. The gearing and working parts are strongly constructed and protected from dirt and the weather. An ingenious device in connection with the exhaust steam suppresses almost entirely the noise caused by its escape. There is a single gear for quick speed and a double gear for heavy loads. Either of the driving-wheels can be thrown in or out of gear, so that, in turning corners, the inner wheel is out of gear while the outer wheel drives the steamer around. Two sizes are made,

much struck by this fact when observing a road steamer, with a heavy vehicle attached to it, being driven round and round in a field thoroughly saturated with melted snow. The road steamer left the merest track in the slushy ground, while the wheels of the vehicle behind cut it into deep ruts. But as the engine passed over these ruts, when retracing the circle, it effaced them, and by and by being detached and allowed to run over the spot alone, it repaired the surface and made it perfectly smooth and even.

For mining and agricultural purposes, for drawing loads, even for military purposes, the road steamer has been used successfully. It can travel over rough or smooth, hard or soft, steep or level roads. In Europe and elsewhere it is rapidly coming into use. The manufacturers in England have been obliged to give a firm in Scotland the right to build the steamers, as they are unable to fill themselves the numerous orders sent in. We have now likewise in the United States a manufactory, where the machines are built, and an agency has been established on the Pacific Coast, where, on the level stretches, the steamer promises to be of the greatest utility.

The experiments in running over rough, sandy and muddy roads, and up steep inclines, tend to show that for mining purposes, for factories, etc., as well as for agriculture, the engine would be of the greatest value. Many a mine now lies idle, which might be profitably worked could the ore be transported at cheaper rates. We find that a 8-horse power engine has been in use for many months,

the soil was very soft, to see if it would be able to get through. It performed all its evolutions to the perfect satisfaction of those present, plowed a little, ran through ruts and mud-holes, ran off at a lively rate with a 5-ton road-roller, and otherwise acted in a brisk and happy manner. The regular trial, however, is yet to be made, and as the Press has been invited to attend when this comes off, our readers will have a full account.

We have only to add, that D. D. Williamson, 32 Broadway, N. Y., is exclusive manufacturer for the United States, and that Mr. Wm. A. Barnaby, Stockton, Cal., is agent for this coast. For the present, any communications to Mr. Barnaby should be addressed to the care of this office, where they will be properly cared for and forwarded to their destination.

NEAT WORK.—A very handsome beam engine, 10x22 inches, has just been built at the Miners' Foundry (coöperative) for the City Gas Company's works at the Patro, under the supervision of Mr. P. B. Bruner, engineer for the gas works and superintendent of the Pacific Rolling mill. This is the handsomest of the kind, perhaps, ever turned out on the coast. It is highly finished, of the best material and workmanship, neatly fitted in all its parts, provided with the Dunbar Packing, Sieberts Eureka Lubricator, steam-jacketed cylinder, etc., and is a credit to the works at which it was built. Although not "firefired," every care has been taken to render it worthy of the room, in which it is to be placed, which room is to be handsomely furnished in all respects.

gives, with the blowpipe, the reactions of lead and antimony very distinctly; and this change of Stetefeldite into antimoniates in this way, by further decomposition, is well known in Nevada.

These ores of Blind Springs are very rich, in part at least, apparently, for one of the specimens is marked as assaying about \$1,600 per ton. They would be considered especially "rebellious" (if Mr. Aaron will allow the term) with their combinations of antimony, sulphur, copper, lead, etc.

No. 518 is a very handsome piece of re-tort-silver, given us by Mr. Aaron to show that his process produces fine bullion, even with such ores. It certainly is very fine-looking silver, and assays about fine.

No. 519 comes from the Esmeralda mine, about 20 miles southwest from Helena, Montana, and was presented by Mr. James S. Russell. It came from a depth of 60 feet from the surface, and is a piece of iron-stained quartz, in which the "color" shows out finely.

*Under this heading we shall continue to mention and describe, according to merit, such specimens of ores, minerals, fossils, curiosities, etc., as may be sent to us by mail or express prepaid. Each article will be numbered, marked with the name of the donor and the locality, and placed in our cabinet. A full account of the place, occurrence, etc., when sent adds much to the value of such specimens.

THE AFRICAN DIAMOND FIELDS.—After all the glowing stories of the heaps of diamonds found in the South African fields, we see it stated that the gems prove, on scientific examination, to be merely "lumps of translucent quartz." How far this is true, we cannot say with authority, but it is easy enough to test the matter without room for question. If the assertion prove true, it will be a sorry story for many.

BY OUR LADY EDITORS.

The Donner Tragedy.

A THRILLING CHAPTER IN OUR PIONEER HISTORY.

(Written for the Press.)

The sufferings of the Donner party, who were snowed in, and detained on the mountains more than three months, in the winter of 1846-7, has been much talked about, and some garbled stories have been published; but from the very nature of the case, anything like a true history was difficult to come at. My informant, who was one of the general company to which the Donner party originally belonged, says that she has never seen anything like a true or competent history of that most horrible period in the lives of these unfortunates. The following she is ready to vouch for, as truth; and if anyone desires further information, or confirmation of what is already given, her name and address will be at their service.

By retracing, though but in idea, the difficult and dangerous steps of the early emigrants, we are enabled more fully to appreciate the homes of comfort, competence and beauty, to which they have led us.

In the year 1846, about the 1st of May, 500 emigrants, under the guidance of Wm. Fowler, left Independence, Missouri, bound for California and Oregon. They all continued in one company until they reached Big Blue River, when the decline of pasturage made it necessary to separate into small companies, that of Mrs. C— being piloted by Wm. Fowler. They were all in advance of the Donner party, but after crossing the Salt Lake Desert the latter nearly caught up with them.

On going over the mountains, the Reed and Donner Company, when they came to the Devil's Canyon, known as Hasting's Cut-off, sent some men forward to examine the route. On their return, they represented the pass impracticable; and leaving the old road, they attempted to cut their way around the high peak, felling, or removing such timber as impeded their progress. In this toilsome work they spent eighteen days, thus exhausting their time, strength and provisions. This detention was one of the chief causes of their being caught in the snow, and of all their subsequent sufferings.

Reed and McCutchins came to their camps nearly starved, having made a meal of wheel-grease and mustard taken from Mr. C—'s wagon, which he had left on the mountain, intending to go back for it.

A Night in the Snow.

At night Mr. C— finding that his cattle had gone off, set out in pursuit of them, leaving his wife alone in that wild and horrible place. But the brave heart of the heroic woman was not easily to be dismayed. Patiently, hopefully, resolutely she watched the night through, with a kind of latent faith that her husband would be preserved, though he was exposed and unprotected to the pitiless snow storm, which, soon after he left, began raging with great fury; and the dismal howling of their faithful dog, heightened the horrors of the scene. But the brave heart fainted not; and every little precaution the occasion prompted or required, was patiently and quietly taken. She trimmed the fire; she watched and adjusted the warming and drying garments; she heated and replenished the evaporating tea; and several times during the night, she went out with a long-handled iron scraper, to scrape the snow from the tented roof, lest it should be broken down by the weight, and leave her without shelter.

Morning came; for the most protracted periods of anxiety and anguish must some time have an end; and aided by the earliest light, the straining eyes of the lonely watcher went out over the wild, for sight or sign of the wanderer; but no track appeared on the mountain road, that lay, still and solemn as death, draped in a winding sheet of spotless snow. Still she hoped—still she believed—that her husband would yet come; and once more, and again and again, she went to the place of lookout; but over all the ghastly whiteness of the scene no form of life appeared.

But look yonder, up the mountain road, to the remotest point of sight! Is that a man? a horse? Do they move? At first sight the motion was slow, so faint as to be nearly imperceptible. Ah, yes! her faith is rewarded at last. He is living! He comes! She flew to meet him, with whatever speed she could make through the depths of snow, and found him greatly exhausted and nearly insensible. He was soon put to bed, and by help of warm blankets, heated stones and hot drink, he partially revived and was able to give a coherent account of himself.

He had followed the cattle about twelve miles, and brought them to the brow of the long hill that overlooked their encampment; but in his weak and exhausted state he could not get them over the brink, from which they drew back in terror. Finally he became bewildered and lost in the storm. He had stood all night, hugging his horse, to keep up animal life; and it was with the greatest difficulty that he was able to regain his seat in the saddle, and keep it until he reached the camp.

Mrs. C—, being informed where the cattle were, put on snow-shoes and a pair of pantaloons, and after a hard walk up the mountain side, found the cattle, and drove them down without any difficulty.

A Strange Proceeding.

That afternoon, for fear of being snowed in, they killed an ox; and while they were preparing some of the meat for supper, Reed and McCutchins came to the camp, with two Indians and 30 horses, sent by Gen. Sutter for the relief of the suffering party. During the night the Indians took two of the best horses and decamped; and in the morning Mr. Reed, with his companion, set off for the snow-bound company, following the trail of the cattle about 12 miles. After traveling as far as the ox-trail reached, they concluded it was not safe to proceed further, and returning to the camp of Mr. C—, staid all night. But instead of hastening forward to the relief of the sufferers, who were but a short day's travel back, Mr. Reed left his provisions in the wagon of Mr. C—, and returned to Sutter's Fort. Mr. and Mrs. C— accompanying them. Here was another great and terrible mistake, to say the least. This was about the middle of November; and had Mr. Reed pushed forward to the rescue of the sufferers, including his own wife and children, more than 80 persons might have been spared three months of suffering, so horrible as to defy description. We cannot conceive of them. There were, doubtless, sufficient reasons for this strange behavior; but at the time the whole proceeding was draped in impenetrable mystery.

Snowed In.

Do any of you imagine what these two simple words may mean? Go with me, then, to the Donner camp; and we shall see. Is this a company of ghastly spectres that haunt the snowy wilderness with the writhing memories of inconceivable, inscrutable suffering? Their wan features, shrinking forms and the trembling limbs, all boken the deep corroding anguish of unappeased hunger. Their wild eyes burn in the sockets; and the dilating pupil nearly covers the iris. They are dying of starvation; and even on the wan and wasted features of the dead, the biting expression of the horrible hunger still remains.

They are now taking their morning meal; and yonder gentle matron—Mrs. Reed—ever more thoughtful for others than herself, is cutting off strips of raw hide, and dividing them into small pieces; and the children come around her with their little tin cups, to receive the precious morsel, that may sustain life a little longer. O, God! that little longer will lay many of them to rest in the sheltering snows!

They had killed all their animals; and their skins had been providentially saved. Hence the supply of raw hides. But at length even this became scarce, and, compared with what followed, was a luxury. Old boots and shoes, bits of saddles or harness, and fragments of leather in every form, were now gathered and rigidly economised. One of the company, who was a child at the time, but afterwards married and lived at San Jose, gave quite an account of the interior of the camp at this period. She said that she and a sister had a quarrel, and almost a fight, for the possession of a little shoe that one of them had found. She declared, too, that she, herself, had eaten a piece of her mother! It is believed that, driven to the last extremity, they devoured the bodies of their dead. But enough is known to show that their sufferings were drawn out to the most terrible strain that human anguish could support, or human strength endure. Let us, then, leave these awful secrets undisturbed, and gently draw a curtain over the revolting scene.

Mr. and Mrs. Brene, with their nine children, had encamped eight or ten miles behind the Donner party; and between the two camps there was kept up such an interchange of neighborly kindness, as the circumstances would allow. By this means the dreadful condition of the Donner camp became known to Mr. & Mrs. Brene. By a careful and wise economy, they had made their provisions hold out; and thus they were able, not only to sustain themselves, but to assist others. They took Mrs. Reed with her four children, and one adopted child, home to their camp, and kept them until relief arrived. Let no one say that economy is an ignoble virtue, remembering that by its help, six precious lives were saved. The woman who could look upon her own nine children and give to others what would shorten their allowance—possibly bring them to starvation—must have a great heart, indeed. It has been said that there is no greater love than this, that a man should die for his friends but; this is by far a nobler action and a diviner love. Mrs. Brene was, indeed, a noble woman; and her name should be inscribed in golden lettering on the page of history. By such high examples, the world is made happier and better; for she who could give to others what her own children might soon suffer for, deserves, and must soon receive, the crown of virtue.

Relief Itself Horrible to Behold.

About the middle of February, seven men and women, finding their condition intolerable, left the Donner Camp, hoping to reach the valley in safety; and out of the fourteen, only five women and two men, came into Mr. Johnson's ranch, then the first house on this side of the mountains, one-half of the whole number having perished by the way.

Mr. Johnson, on hearing the great distress of the snow-bound company, sent a messenger to Sutter's Fort, with an account of their terrible sufferings. When the news came in, the citizens volunteered for the rescue of the sufferers. Gen. Sutter, with his well-known promptness and liberality, offered them horses and provisions; and without delay seven men were despatched, Messrs. Glover, O'Brien, Montgomery, Curtis, and three others, whose names are not remembered.

These seven brave men set off on their difficult and perilous undertaking, and pursued their journey as far as Bear valley, with their horses and packs. But finding their route thence impassable for horses, they resolved to take as much as each man could carry and proceed on foot. Leaving the horses and the remainder of the provisions with one of their number, the six men, each with a heavy load on his back, boldly set foot on the trackless mountain, and on the second day reached the Donner camp, when the desperate fate of the unfortunates was discovered. No description can give any competent idea of this horrible scene. Some were snow blind, others insane, others dying, others dead; while the wasted forms and ghastly looks of all presented a most shocking sight.

Language cannot describe the features of the living when they saw that relief had actually come. Some became nearly insensible or delirious from excess of joy; others were still as death in the intense strain of another moment's waiting; while many faces were distorted by a crazy, foolish, almost demonic laugh, horrible to behold. They swallowed the small pittance allowed, almost without mastication, and held out their trembling hands for more. Great caution was necessary in order to avoid the ill effects of a giving them too much at a time, but the madness of their hunger soon began to subside.

Fortunately the news spread rapidly over all the then inhabited parts of the state. At San Jose another expedition was fitted out; and, with Mr. Reed at their head, they set off with sufficient food to bring the sufferers in. By the time this new supply arrived their former stock of provisions was exhausted, and now comes the task of getting the sufferers, all weak and emaciated, into some settlement.

Three were left behind to their fate: a Dutchman by the name of Reesburgh, old Mrs. Donner, and a child that Mrs. McCutchins, one of the fourteen who went out, had left behind. The child died the next day; and Mrs. Donner was probably murdered by the Dutchman. She had about her several thousand dollars in specie, and, not being permitted to take it with her, she preferred to stay with it, and with a true miser-feeling, loving her money better than life, she surrendered herself, hugging her purse to the last.

A party of men who afterwards visited the camp, found the old lady with her throat cut, and a bucket near by which had been used to catch her blood. Part of

her body was sliced into steaks to sustain the life of the murderer. Thise Resburgh was afterwards tried for the murder; but on the discovery of gold he came up from the Bay, where he had been sojourning since his acquittal, and opened an eating house at Fort Sutter, which was well known as *Cannibal Tent*.

A touching little incident is related of these times. On the passage from the camp to Fort Sutter, Mr. Brene and one of his little daughters became very faint, and it was feared that they would die. It was proposed to Mr. Reed that they should stop and light fires, and try to restore them. He treated the matter coolly, not to say gruffly, saying he didn't think it worth while to take much trouble about it. On hearing this, his little girl took him by the hand, saying in the sweet earnestness of a grateful child, "Papa, if it hadn't been for Mr. Reed we should all have been dead!" The sight of the sweet pleader brought the lesson home to his heart. He instantly ordered a halt; when they kindled fires on each side of them, administered remedies, and the sufferers were saved.

F. H. MCD.

How to Have a Loving Wife.

If you would have a loving wife, be as gentle in your words after as before marriage; treat her quite as tenderly when a matron as when a miss; don't make her maid-of-all-work, and then ask her why she looks less tidy and neat than when "you first knew her;" don't buy cheap, tough beef, and scold her because it does not come on the table "porter-house;" don't grumble about squalling babies, if you can't make up a "nursery," and you remember that "baby" may take after papa in his disposition; don't smoke and chew tobacco, thus shatter your nerves, spoil your temper, and make your breath a nuisance, and then complain that your wife declines to kiss you. Go home joyous and cheerful to your wife, and tell her the good news you have heard, and not silently put on your hat and go off to the "club" or the "lodge," and afterwards let her learn that you spent the evening at the opera, or at a fancy hall with Mrs. Dash. Love your wife, be patient; remember that you are not perfect, but try to be; let whisky, tobacco and vulgar company alone; spend your evenings with your wife, and live a decent Christian life, and your wife will be loving and true—if you did not marry a thoughtless beauty, without sense or real worth; if you did, who is to blame if you suffer the consequences.—*Phrenological Journal*.

Modern Rules of Good Breeding.

A work entitled "Good Society" says that the corner of a visiting card is turned down to indicate that the caller intends the compliment of her visit to include some other member of the family in the house. A lady should not rise from her seat when a gentleman is brought up and introduced to her, unless he is an elderly man, or, from peculiar circumstances or family connection, the lady wishes to pay him the marked attention of shaking hands at a first interview. When people meet at the house of a common friend, they may converse together without an introduction, if they find themselves in proximity, and an occasion arises for speaking; but, without a special introduction, neither lady should recognize the other if they meet in public the next day.

DANGER OF REVERIE.—Do anything innocent rather than give yourself to reverie. I can speak on this point from experience. At one period of my life I was a dreamer and a castle builder. Visions of the distant future took place of present duty and activity. I spent hours in reverie. I supposed I was seduced in part by physical debility. But the body suffered as much as the mind. I found, too, that the imagination threatened to influence the passions, and that if I meant to be virtuous I must dismiss my musings. The conflict was a hard one; I resolved, prayed, resisted, sought refuge in occupation, and at length triumphed. I beg you to avail yourself of my experience.—*Channing*.

A lady and gentleman of Troy, N. Y., whose connubial bliss is perfect in everything, save the presence of children around the domestic fireside, were examining some illuminated mottoes in a book store, the other day, when the wife picked out one bearing these words: "God bless our home." The husband thought that very good, but still not exactly what they wanted. Looking a little farther, he picked up this one: "Suffer little children to come unto me."

HOUSEHOLD READING.

Dried Beef.

In our last issue we gave a very good receipt for cooking dried beef. We here append some very pertinent remarks upon the use of this very good and convenient article of diet, from the American *Agriculturist*: "The good qualities of dried beef as an article of food for the family, are not fully appreciated. In point of excellence, it is one of the nicest articles, when properly prepared, that we have in our storeroom. It is also one of the most economical articles of food; quite a small quantity of dried beef, shaved very fine, and cooked with a nice gravy, will serve for meat for a family at very small expense. Then it is so convenient to have; always ready; always acceptable. To people who live convenient to market, it is not of so much importance; but to us, who live at a distance from towns, dried beef is one of the necessary articles in our bill of fare. We frequently entertain guests at our table who never have seen dried beef served other than as a relish for bread and butter; shaved and eaten without cooking. There are several methods of cooking it. Some prefer it cooked with a gravy of water, seasoned with butter, thickened with flour, and, perhaps, eggs broken in while cooking. Others cook it with crumbs of sausage, frying the sausage first, then adding the beef with water, and thickening with flour. It is also very good cooked with a little sweet milk and sweet cream, the gravy being thickened with flour; allow it to boil once; that is all the cooking it requires. A dish of dried beef, properly cooked, served with toast, baked potatoes, and boiled eggs, is a very nice provision for breakfast or a dinner prepared in haste. When too salt, it can be remedied by soaking, after cutting and before, and cooking, and adding a little white sugar while cooking, to restore the sweetness lost by soaking. Sugar-cured beef is much nicer than that cured with salt alone. I put mine into a sweet brine, such as is used for pork hams."

SOMETHING ABOUT SOUPS.—It is the general impression that a soup which, when cold, sets into a strong jelly must be the most nutritious; but such is not the fact. The soup "sets" because it contains the gelatine or glue of the sinews, flesh and bones; but on this imagined richness alone, it has, by recent experiments, been proved that no animal can live. The jelly of bones boiled into soup can furnish only jelly for our bones; the jelly of sinews or calf's feet can form only sinew; neither flesh nor its juices set into a jelly.

It is only by long boiling we obtain a soup that sets, but in a much less time we get all the nourishing properties that meat yields in soups that are no doubt useful in cases of recovery from illness, when the portions of the system in which it occurs have been wasted; but in other cases, though easily enough digested, jelly is unwholesome, for it loads the blood with not only useless but disturbing products. Nor does jelly stand alone in that particular. Neither can we live on meat which has been cleared of fat, long boiled, and has all the juice pressed out of it; a dog, so fed, lost in forty-three days a fourth of his weight; in fifty-five days he bore all the appearance of starvation, and yet such meat has all the muscular fiber in it.

HOW TO ACT IN CASE OF POISON.—Whatever is done must be done quickly. The instant a person is known to have swallowed poison by design or accident, give water to drink, cold or warm, as fast as possible, a gallon or more at a time, and as fast as vomited drink more; tepid water is best, as it opens the pores of the skin and promotes vomiting, and thus gives the speediest cure to the poisonous article. If pains begin to be felt in the bowels, it shows that part at least of the poison has passed downwards; then large and repeated injections of tepid water should be given, the object in both cases being to dilute the poison as quickly and as largely as possible. Do not wait for warm water—take that which is nearest at hand, cold or warm, for every second of time saved is of immense importance; at the same time send instantly for a physician, and as soon as he comes turn the ease into his hands, telling him what you have done. This simple fact cannot be too widely published; it is not meant to say that drinking a gallon or two of simple water will cure every case of poisoning; but it will cure many, and benefits all by its rapidly-diluting quality. —*Journal of Health.*

About Biliousness.

Biliousness is a common malady. A great many people are bilious. They have no dyspepsia, they never had a symptom of dyspepsia in their life; they are only bilious. Now this word biliousness is a sort of respectable cover for piggishness. People are not bilious when they eat as they should.

Reader, are you bilious? [Rather a hard question after the above hard word.] Let me prescribe for you. If you follow my prescription, and don't get well, write me, and in the next edition I will announce my error.

First, on getting up and going to bed drink plenty of cold water. Eat for the morning meal, until the bilious attack passes, a little stale bread, say one slice, and a piece as large as your hand of boiled beef or mutton. If the weather is warm, take instead a little cracked wheat or oatmeal porridge. For dinner take about or near the same thing. Go without your supper. Exercise freely in the open air, producing perspiration, once or twice a day. In a few days your biliousness is all gone. This result will come, even though the biliousness is of the spring sort, and one with which you have from year to year, been much afflicted.

Herb dishes, bitter drinks, lager beer, ale, whisky, and a dozen other spring medicines are simply barbarous.—*Ex.*

MEDICAL QUALITIES OF PUMPKINS.—A prominent physician of New York City, speaking of the properties of pumpkins, says that in his travels in Syria he found pumpkin seeds almost universally eaten by the people for their supposed medical qualities. Not because they are diuretic; but as an antidote against animalcules, which infest the bowels.—They are sold in the streets as apples and nuts are here.

It is said to be a medical fact that persons have been cured of tape-worm by the use of pumpkin-seeds. The outer skin being removed, the seeds are bruised in a mortar into an oily, pasty mass. It is swallowed by the patient after fasting some hours, and it takes the place of chyle in the stomach, and the tape-worm lets go its hold on the membrane and becomes gorged with this substance, and, in some measure, probably torpid. Then a large dose of castor oil is administered, and the worms are unable to renew their hold.

WHAT CLOVES ARE.—Cloves are the unopened flowers of a small evergreen tree that resembles in appearance the laurel or the bay. It is a native of the Molucca or Spice Islands, but has been carried to all the warmer parts of the world, and is now cultivated in the tropical parts of America. The flowers are small in size, and grow in large numbers, in clusters, to the very ends of the branches. The cloves we use are flowers gathered before they are opened and while they are green. After being gathered, they are smoked by a wood fire, and then dried in the sun. Each clove consists of two parts, a round head, which is the four petals or leaves of the flower rolled up, enclosing a number of small stalks, or filaments; the other part of the clove is terminated with four points, and is in fact, the flower cup and the mripe seed vessel. All these parts may be distinctly seen if a few cloves are wet for a short time in hot water, when the leaves of the flower soften, and readily unroll. Both the taste and smell of cloves depend on the quantity of oil they contain. Sometimes the oil is separated from the cloves before they are sold, and the odor and taste in consequence much weakened by such unfair proceedings.

PURE AIR in all buildings is of primary importance, whether it be a family dwelling, or the abode of those animals in the healthfulness, and consequent usefulness, of which the owner has so deep an interest. Success, in any pursuit, depends very much upon the amount of intelligence which is employed in its prosecution.

Foul air is probably, directly or indirectly, the cause of nine-tenths of the diseases of the land, especially of fevers. Diphtheria, typhoid and scarlet fever and many other most serious illnesses have their origin in cellars, both in city and country; and we can do our readers no greater service than to urge them to see that, at all times, they are in a dry, sweet, wholesome condition: Even foul air enough to seriously taint a whole house rises from the drains of stationary wash-stands left open over night.

PEANUT OIL FOR BUTTER.—Peanut oil, used in the South during the war, as a substitute for butter, is again coming into use in view of the high price of the latter.

Household Receipts.

MUFFIN PUDDING—SOMETHING NICE.—For a muffin pudding, cut six stale muffins in very thin slices, lay them in a deep dish, pour over them half a pint of brandy, in which you will let them soak. Simmer half a pint of cream with a stick of cinnamon, the grated peel of a large lemon, and four ounces of lump sugar. Let it remain simmering over the fire for ten minutes, then take off and keep stirring until cold, then mix it by degrees with the yolks of eight eggs, well beaten, butter a plain mold and line it with muslin, the crusty side being outwards. Fill up the mold with alternate layers of dried cherries or other fruit, and the crumbs of the muffin. Flavor the custard with orange-flower water, and pour it into the mold. Keep the mould upright, by sitting it in bran until the custard has soaked in. Then bake it half an hour.

TO SOFTEN KID BOOTS.—Melt a quarter of a pound of tallow, then pour it into a jar, and add to it the same weight of vegetable oil, stir and let it stand till cold; apply a small quantity, occasionally, with a piece of flannel. This will soften and will not injure the kid.

TO CURE DYSPESIA.—Take raw clams and broth or, the uncooked broth alone, from a gill to a half pint, on an empty stomach, before breakfast, for a month, if necessary, or even longer. This is in reply to Sarah's inquiry, and in my case, I have found it of great benefit.—*August Cor, Rural New Yorker.*

APPLE FRITTERS.—Pare and core some large apples, cut them into round slices. Soak them in wine, sugar and nutmeg for two or three hours. Make a batter of four eggs, a tablespoonful of milk; thicken with enough flour, stirred in by degrees, to make a batter; mix it two or three hours before it is wanted, that it may be light. Heat some butter in a frying pan; dip each slice of apple separately in a batter, and fry them brown; sift powdered sugar and grate nutmeg over them.

PRICASED CHICKEN.—Cut up chicken, and boil with slice or two of pork in sufficient water to cover till quite tender. Fry some pork and when cooked a little, drain the chicken and fry with the pork till quite brown. Then take out, and pour the broth into the frying pan, with the pork fat, and make a gravy with browned flour, season well with butter, put the chicken into the gravy; be sure and have the fat quite hot when the chicken is put in, so it will brown readily.

Mechanical Hints.

RURAL PICTURE FRAMES.—Rustic wood for this and other purposes is in great favor nowadays. With a little care in selection of material, and skill in bandling tools, we may frame our engravings and paintings at slight cost. Oak wood, denuded of the bark, presents a beautifully corrugated surface, out of which the knife easily removes the few fibres which adhere, and it is ready for varnishing as soon as it is seasoned. The "season cracks," should they occur, may be filled with dark-brown putty, and will even lighten the general effect.

Take a thin board, of the right size and shape, for the foundation of "mat," saw out the inner oval or rectangular form to suit the picture. Nail on the edge a rustic frame made of the branches of hard seasoned wood, and garnish the corners with some pretty device, such, for instance, as a cluster of acorns. Ivy may be trained to grow around these frames with beautiful effect.—*Scientific American.*

BRONZING FOR LEATHER.—Dissolve a small amount of so-called insoluble aniline violet in water, and brush the solution over the article to be bronzed; it will dry quickly and may have to be repeated. Shoes treated in this manner have a beautifully bronzed appearance.

ELASTIC AND SWEET STAREH.—Good common glue is dissolved in water, on the water bath, and the water evaporated down to a mass of thick consistence, to which a quantity of glycerine, equal in weight to the glue, is added, after which the heating is continued until all the water has been driven off, when the mass is poured out into molds, or on a marble slab. This mixture answers for stamps, printers' rollers, galvano-plastic copies, etc. The sweet glue, for ready use by moistening with the tongue, is made in the same way, substituting, however, the same quantity of powdered sugar for the glycerine.

VARNISH FOR OIL PAINTINGS.—Take dextrine 2 parts, alcohol 1 part and water 6 parts.

Life Thoughts.

THERE comes a time when one sweet child-face is more to us than all the world beside.

He is our friend who helps us to one new thought or who inspires us to one noble action.

The soul without passion is like mripe fruit; not until the sunshine of a real love touches it, does it develop sweetness and perfection.

The best sometimes err, but still remain the best; while the worst is well at times, yet still remain the worst.

A BEAUTIFUL THOUGHT was that in the mind of a little girl, who, on beholding a faded rose, round which three little buds were unfolded, exclaimed to her brother: "See, Willie, these little buds have awakened in time to kiss their mother before she dies."

HOW TO SECURE PLEASANT DREAMS.—A French writer has said that to dream gloriously, you must act gloriously when awake; and to bring angels down to hold converse with you in your sleep, you must labor in the cause of virtue during the day.

HOW TO DESTROY ENEMIES.—"Why do you show favor to your enemies instead of destroying them?" said a chieftain to the Emperor Sigismund. "Do I not destroy my enemies by making them my friends?" was the Emperor's noble reply. Kindness is the best weapon with which to beat an adversary.

Testing a Man.

No man is a man till he is tried; till he has passed through the ordeal; through deep water and scorching fires. A man surrounded with comforts, friends and relations, food and raiment; whose barns are filled with plenty, and whose presses gush out with new wines; who eats his fill; sits and reads, doles about, taking his ease and pleasure; smoking his pipe and chewing his cud; is he a man? Far from it. A man is not a man until he is proved—has passed the ordeal—drank the bitter cup; risen above life's conflicts; mounted the hillows of the wave.

Was Joseph a man in deed, till he was cast into the pit; torn away from the bewitching tempter, leaving his garments behind; till he groaned in the prison house? Was Moses a man till he had passed the fiery ordeal? Was Paul truly a man till he suffered perils by sea and land, and finally received forty stripes save one.

Let a man be forsaken of all, as was Job—then if he comes out, rising triumphantly over all obstacles, he is a man.

LIVING TO ONE'S SELF.—The cure of a little village near Bellizona, to whom a traveler expressed wonder that the peasants allowed the Ticini to flood their fields, replied that they would not join to build an effectual embankment, high up the valley, because everybody said, "that would help his neighbors as much as himself." So every proprietor built a bit of low embankment about his own field, and the Ticini, as soon as it had a mind, swept away and swallowed up all together.

LEISURE HOURS.—It was a beautiful observation of the late William Hazlitt, that "There is room enough in human life to crowd almost every art and science into it. If we pass no day without the company of books—we may with ease fill libraries or empty them of their contents. The more we do, the more we can do; the more busy we are, the more leisure we have."

INDUSTRY.—It is no man's business whether he has genius or not; work he must, whatever be is, but quietly and steadily; and the natural and unforced results of such work will be always the thing God meant him to do, and will be his best. No agonies or heart rendings will enable him to do any better. If he is a great man, they will be great things; but always, if thus peaceably done, good and right.—*Ruskin.*

DON'T BE LIKE A LOBSTER.—It is said that when the waves carry a lobster up into the rocks and leaves him there, high and dry, there he remains perfectly inactive, waiting for the waves to come and wash him off again. And should the waves fail to reach him he miserably dies, when by a little exertion of his own he could have reached the water which was lying only a few feet from him. So it is with some men. When the waves of fortune leave them high and dry on the rocks of adversity, they wait to be borne off again without making any effort of their own. Young man, don't be like a silly lobster.

Venezuela Mines.

[The following communication from Capt. Dahlgren has been received, with the promise of a series of articles on mining processes and customs in Mexico. Capt D. is well known in many parts of our country.—ED.]

EDITORS PRESS:—I forward you a copy of a letter from an old friend of mine which will explain itself. Mr. W. is well known in Montana and Eastern Nevada. He is English by birth, but American by adoption;—a machinist by trade, and an honest and industrious man and excellent mechanic. He is 50 years of age, and went to the country to put up the engine and boiler of a quartz mill and to run it. He has been engaged in such work for seven or eight years past.

CARATAL, NUEVA PROVINCIA,
VENEZUELA, July 10, 1870.

FRIEND DAHLGREN:—There are only two districts formed as yet—Callao and Panama—with plenty of room for more discoveries. The lodes run northeast and southwest. They are, in fact, a vast network of lodes. Sink where you will, there is gold—not in pockets, but in true quartz veins. It pays from the start. The quartz is not contaminated with any base metal of any kind, which requires chemical processes and hell-roaring machinery to save the gold. It averages from \$35 to \$70 per ton, and is readily crushed and saved. The country is very unhealthy on account of fevers and liver complaint. Few whites escape. The country is mountainous and deeply wooded; in fact, impenetrable without cutting a road inch by inch. We are now passing through the wet season. It rains every afternoon in torrents, and the rivers and gulches are impassable. * * * * The American mill (20 stamps) is running, and ships \$26,000 monthly. They are adding 20 more stamps (a Chicago mill from Eagle works). Our heavy pieces cannot cross yet, but all the light pieces are stored in our mill, which is up and enclosed. The mill is a 12-stamp Howland Rotary Battery from Morey & Sperry's, of New York. Were we running, we would be turning out the "hars," sure. We have six months' ore out and hauled, and in every portion of the quartz gold is visible to the eye or with the glass. Our success is sure. This is no myth; no humbug. I tell you facts. You would be astonished to see it. All that is wanted are the mills. The ore is here, sure. Plenty of fuel, water, cheap labor and grub. Leave Nevada and come here with a mill—the bigger the better. You would make a fortune, sure.

Your old friend,

JOHN S. WILLIAMS.

These are the plain facts—plenty of fine gold quartz and fevers or liver complaint. It is 150 miles back from the Orinoco River, and the port of entry is Bolivar, on that river. It is reached by steamer to San Thomas from New York in 12 days or so. There will be a stampede there, surely, one half of whom will die, and the other half suffer the rest of their lives. Three Howland Rotary Batteries have gone now, of 12 stamps each; and engineers and superintendents are in demand.

C. B. DAHLGREN.

SCIENTIFIC PRESS. We are pleased to learn that the circulation of this valuable journal is rapidly increasing in all the States and territories. The efforts of the proprietors, Messrs. Dewey & Co., to furnish a reliable paper for the miner, farmer, mechanic and inventor, are successful, and their paper has obtained an enviable reputation for ability, and truthfulness.

Complete Volumes—Bound or unbound—of the SCIENTIFIC PRESS from Jan. 1, 1864, to date, can be had at reasonable rates at this office. They contain much valuable information.

PACIFIC RURAL PRESS.

SUBSCRIBE! GET UP CLUBS!

Farmers, Horticulturists, Sericulturists, Stockmen, News dealers, Carriers, Home Readers and all Ruralists will be furnished sample copies free on receipt of postage.

Annual subscription \$4. Clubs of ten or more, \$3 each and a free copy to the getter up of the club. Extra inducements to agents for the new paper. First regular issue Jan. 7th 1870.

Mining and Other Companies.

Owing to the time necessary to mail the present large edition of the SCIENTIFIC PRESS, we are obliged to go to press on Thursday evening—which is the very latest hour we can receive advertisements.

Alleghany Consolidated Gold Mining Company, Sierra County, California.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the 27th day of December 1870, an assessment of fifty cents per share was levied upon the capital stock of said Company, payable immediately in United States gold and silver coin, to the Secretary.

Any stock upon which said assessment shall remain unpaid on the 27th day of January 1871, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday the 13th day of February 1871, to pay the delinquent assessment, together with costs of advertising and expense of sale. By order of the Board of Trustees. J. M. BUFFINGTON, Sec'y. Jan7 Office, 37 New Merchants Exchange.

Continental Silver Mining Company—Location of Works, near Hamilton, White Pine County, Nevada.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company held on the 31st day of December 1870, an assessment of (\$1) one dollar per share was levied upon the capital stock of said Company, payable immediately to the Secretary, at the office of the Company, 302 Montgomery Street, San Francisco Cal., in gold coin of the United States.

Any stock upon which said assessment shall remain unpaid on the 6th day of February 1871, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Wednesday the 22nd day of February, to pay the delinquent assessment, together with costs of advertising, and expense of sale. By order of the Board of Trustees. H. H. BLAKE, Secretary. Office 302 Montgomery Street, San Francisco Cal. Jan7

El Refugio Petroleum Company.—Location Santa Cruz County, State of California.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company held on the 18th day of January 1871, an assessment of sixty five (65) cents per share was levied upon the capital stock of said Company payable immediately in United States gold coin, to the Secretary R. Wegener, No. 414 California Street San Francisco California.

Any stock upon which said assessment shall remain unpaid on the 31st day of February 1871, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Tuesday the 14th day of March 1871, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees. R. WEGENER, Secretary. Jan7 Office, 414 California Street, San Francisco, Cal.

Jennie A. Consolidated Mining Company, White Pine County, Nevada.

Notice is hereby given that at a meeting of the Board of Trustees of said Company, held on the 31st day of December 1870, an assessment of ten cents per share was levied upon the capital stock of said Company, payable immediately in United States gold and silver coin, to the Secretary.

Any stock upon which said assessment shall remain unpaid on the 6th day of February 1871, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday the 27th day of February 1871, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees. J. M. BUFFINGTON, Sec'y. Office, Room 37 New Merchants Exchange, San Francisco, California. Jan7

I. X. L. Gold & Silver Mining Company, Location of Works Silver Mountain Mining District Alpine County, California.

NOTICE.—There are delinquent upon the following described stock on account of assessment levied on the 18th day of Oct. 1870, the several amounts set opposite the names of the respective share-holders, as follows:—

Names.	No. Certificates	No. Shares.	Amount.
Gomer Evans.....	335	90	\$90 00
G W Cuddback.....	318	2	0 00
Donald Davidson.....	328	17 1/2	17 50
Arch Carmichael.....	142	5	5 00
Arch Carmichael.....	142	10	10 00
A Wagner.....	388	2 1/2	2 50
Christian Helms.....	387	2 1/2	2 50
Louis Blanding.....	237	28	28 00
Henry Eno.....	301	3	3 00
Henry Eno.....	327	7 1/2	7 50
Henry Eno.....	394	19	19 00
E F Gibson.....	270	12	12 00
Walter J Gardiner.....	338	20	20 00
Walter J Gardiner.....	339	20	20 00
Walter J Gardiner.....	400	20	20 00
Walter J Gardiner.....	401	10	10 00
John Bolt.....	381	10	10 00
D C Riddell.....	258	5	5 00
R K Love.....	129	12	12 00

And in accordance with law, and an order of the Board of Trustees, made on the 18th day of February 1871, said shares of each parcel of said Stock as may be necessary will be sold at public auction by Olney & Co., Auctioneers, 502 Montgomery Street, San Francisco, California, on Tuesday the 31st day of Jan. 1871 at the hour of 12 o'clock M., of said day, to pay said delinquent Assessment thereon, together with costs of advertising and expenses of sale. J. CROWNSHIELD, Secretary. Office, Pioneer Hall (upstairs) 808 Montgomery Street, San Francisco, California. Jan4-3t

Kincaid Flat Mining Company, Tuolumne County, California.

NOTICE is hereby given that at a meeting of the Board of Trustees of said Company, held on the 13th day of January 1871, an assessment of \$2.50 per share was levied upon the capital stock of said Company, payable immediately in United States gold and silver coin, to the Secretary, 220 Clay Street, San Francisco, Cal.

Any stock upon which said assessment shall remain unpaid on the 16th day of February, 1871, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Saturday the 4th day of March 1871, to pay the delinquent assessment, together with the costs of advertising and expenses of sale. By order of the Board of Trustees. D. H. CROWE, Sec'y. Jan4 Office, 220 Clay St., San Francisco.

Nevada Land and Mining Company—Location of Works, Stepto, Johnson & Latham Antelope and Clifton District, Elko County, State of Nevada.

Notice is hereby given that at a meeting of the Board of Trustees of said Company, held on the 10th day of January, 1871, an assessment of two and one half (2 1/2) cents per share was levied upon the Capital Stock of said Company, payable immediately, in United States gold coin, to the Secretary, at his office, Room 5, No. 302 Montgomery Street, San Francisco, California.

Any stock upon which said assessment shall remain unpaid on Monday, the 20th day of February, 1871, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the 13th day of March, 1871, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees. WM. H. WATSON, Secretary. Office: Room 5, No. 302, Montgomery Street, San Francisco, California.

Noonday Silver Mining Company.—Location of Works—White Pine Mining District, White Pine County, Nevada.

Notice is hereby given, that at a meeting of the Trustees of said Company, held on the 19th day of January, A.D. 1871, an assessment of twenty (20) cents per share was levied upon the capital stock of said Company, payable immediately in United States gold coin, to the Secretary, at the office of the Company, Room 21, Hayward's Building, No. 419, California Street, San Francisco, California.

Any stock upon which assessment shall remain unpaid on the 23rd day of February 1871, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Friday the 17th day of March, 1871, to pay the delinquent assessment, together with costs of advertising and expenses of sale. C. E. ELLIOTT, Secretary. Office, Room 21, Hayward's Building, 419, California Street, San Francisco, California.

Ophir Copper, Silver and Gold Mining Company—Location of Works, Ophir Placer County, California.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the Thirtieth day of December A. D. 1870, an assessment of forty cents per share was levied upon the capital stock of said Company payable immediately, in United States gold coin to the Secretary, at the Company's office, No. 314 California St., San Francisco, California.

Any stock upon which said assessment shall remain unpaid on the 5th day of February A. D. 1871, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before will be sold on Monday the 27th day of Feb. 1871, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees. R. G. BRUSH, Secretary. Jan7 Office No. 314 California Street.

Placer Gold Mining and Canal Company—Location of Works, Placer County, California.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the fourth day of January 1871, an assessment of \$6.50 per share was levied upon the capital stock of said Company, payable immediately in United States gold coin, to the Secretary at his office 24 Post Street, San Francisco Cal.

Any stock upon which said assessment shall remain unpaid on Wednesday the fifteenth day of February, 1871, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Saturday, the 11th day of March 1871, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees. C. S. HALEY, Secretary. Jan7 Office, 24 Post St., San Francisco, Cal.

St. Patrick Gold Mining Company—Location of works, Ophir District, Placer County, Cal.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the 27th day of December, 1870, an assessment of one dollar (\$1) per share was levied upon the capital stock of said Company, payable immediately, in United States gold coin, to the Secretary, at the office of the Company No. 402 Montgomery Street, San Francisco, California.

Any stock upon which said assessment shall remain unpaid on the first day of February 1871, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the 20th day of February, 1871, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees. T. F. CRONISE, Secretary. Jan7 Office, No. 402 Montgomery St., San Francisco.

MARAVILLA COCOA.—For Breakfast.—The Globe says: "Various importers and manufacturers have attempted to attain a reputation for their prepared Cocos, but we doubt whether any thorough success has been achieved until Messrs. Taylor Brothers discovered the extraordinary qualities of 'Maravilla' Cocoa. Adapting their perfect system of preparation to this finest of all species of the Theobroma they have produced an article which supercedes every other Cocoa in the market. Entire solubility, a delicate aroma, and a rare concentration of the purest elements of nutrition, distinguish the Maravilla Cocoa above all others. For home-paths and invalids we could not recommend a more agreeable or valuable beverage." Sold in packets only by all Grocers, of whom also may be had Taylor Brothers' Original Homopathic Cocoa and Soluble Chocolate. Steam Mills—Brick Lane, London. 16v20-y

MOORE'S RURAL NEW-YORKER,

THE GREAT ILLUSTRATED

Rural and Family Weekly.

This is not only the Largest, Best and Cheapest, but by far the Largest-Circulating Journal of its Class! National in Character, Ably Edited, Superbly Illustrated and Printed, it is the

BEST AMERICAN WEEKLY!

It is the standard authority on all branches of Agriculture, Horticulture &c. As a Literary and Family paper it is a favorite from Canada to California. Indeed Moore's Rural has no rival in its sphere, and is the largest illustrated Journal on the continent—each number containing sixteen five-column pages, (double the size of most papers of its class).

A NEW FEATURE.

Among recent accessions to the Rural's unequalled Editorial staff is that of Hon. T. HART HYATT, of Cal., as editor of the Pacific Coast Department—a new and valuable feature. By prompt mailing and rapid railroad transit, the Rural now reaches the Pacific slope about the time of its date.

TERMS, INDUCEMENTS, ETC.

TERMS—\$3 a year of 52 Numbers, and only \$2.50 in clubs of ten. This Quarter's 13 numbers sent FREE, as offered above. Our club inducements for 1871 are unprecedented. Specimens, Premium Lists, &c., sent free to all forming clubs,—and we want a live Club Agent in every town. Address

ADAPTED

FOR
Smelting,

Foundry,

Mining

and

Steamships.

REQUIRES

Fifty Per Cent.

LESS POWER

Than any Blower

Now in use.

One of these Blowers may be seen on exhibition at W. T. Garratt's Brass Foundry, corner of Mission and Fremont street. They are also in use at the Almaden Quicksilver Mine; Gridley's Foundry, Gold Hill, Nevada; Zetna Iron Works, San Francisco, and many other places.

CAUTION.—Purchasers will find it to their advantage to apply direct to the Stockton Agency, as certain parties, not authorized to manufacture the Blower, have put in the market machines of inferior construction, which do not answer all the requirement of the genuine article.

Quartz, Saw and Grist Mill Irons, Steam Engines, Horse Powers, High and Low Pressure Steam Engines, Steamboats and Propellers, made at short notice.

The California Powder Works

No. 314 CALIFORNIA STREET,

SAN FRANCISCO.

Manufacturers and have constantly on hand

SPORTING,

MINING,

And BLASTING

POWDER,

Of SUPERIOR QUALITY, FRESH FROM THE
MILLS, it being constantly received and transported
into the interior, is delivered to the consumer within a
few days of the time of its manufacture, and is in every
way superior to any other Powder in Market.
We have been awarded successively

Three Gold Medals

By the MECHANICS' INSTITUTE and the STATE AG-
RICULTURAL SOCIETY for the superiority of our
products over all others.

We also call attention to our

HERCULES POWDER,

Which combines all the force of other strong explosives
now in use, and the lifting force of the BEST BLASTING
POWDER, thus making it vastly superior to any other
compound now in use.
A circular containing a full description of this Pow-
der can be obtained on application to our Office.
16v20-3m JOHN F. LOHSE, Secretary.Pain is supposed to be the lot of us poor mortals, as
inevitable as death itself and liable at any time to come
upon us. Therefore it is important that remedial
agents should be at hand to be used as an emergency,
when the seminal principle lodged in the system shall
develop itself, and we feel excruciating agonies of pain
or the depressing influence of disease. Such a reme-
dial agent exists in the PAIN KILLER, whose fame has
made the circuit of the globe. Amid the eternal ices of
the polar regions or beneath the intolerable and burning
sun of the tropics, its virtues are known and appreciated.
Under all latitudes, from the one extreme to the other,
suffering humanity has found relief from many of its
ills by its use. The wide and broad area over which
this medicine has spread, attests its value and potency.
From a small beginning, the Pain Killer has pushed
gradually along, making its own highway, solely by its
virtues.Such unexampled success and popularity has brought
others into the field, who have attempted, under simi-
larity of name, to usurp the confidence of the people and
turn it to their own selfishness and dishonesty, but their
efforts have proved fruitless, while the Pain Killer is
still growing in public favor.

NOTICE.

THE undersigned having completed arrangements through one of the first "Promoters" in Europe, for placing CALIFORNIA MINING SECURITIES ON THE LONDON MARKET, is now able to offer superior facilities for disposing of reliable mines of gold, silver or other minerals, as above stated. All properties given in my charge will be placed direct, without loss of time, upon the London Market, through a perfectly reliable party, long resident and entirely familiar with the business. Every advantage offered to parties owning shares in American mines worked by English capital, to dispose of the same. Advances made and ample security given when required.

Machinery.

STEAM JET PUMP.

Blakelock & Williams' Patent, for
Water, Oils, Acids, Etc.

The best COLD WATER
pump for filling tanks for
stationary or portable
Steam Engines. Also highly
recommended for
MINES, DISTILLERIES,
SALT WORKS, STONE
QUARRIES, and similar
places, and saves the ex-
pense of putting up and
running an engine.

We ask the attention of
all proprietors of steam
power to the following
points of merit.—It is
operated by steam taken
directly from the Boiler
into the Pump; it has no
valve or wearing parts of
any kind; it requires no
belts, pulleys, or machin-
ery of any kind; it oper-
ates entirely independent of an engine; it will not choke
up with foul water; it costs much less to put up and
start; it will not wear out in a lifetime, or require re-
pairs; it is reliable, and certain to work at all times; it
is not liable to injury from freezing.

Satisfaction guaranteed or the money refunded.
Send for Circular. PARKER & HUNT,
Southeast cor. Tenth & K Streets, Sacramento City Cal.

HYDRAULIC CHIEF.

Fisher's Knuckle Joint and Nozzle is the best Hydraulic
Machine in use. Machines manufactured to order to throw from one
to a seven inch stream. HYDRAULIC MINERS TAKE NOTICE. The notice
published by R. H. S. & Co. is a fraud, that they have suits pending in the
United States District Court which involves the working principle of
my HYDRAULIC CHIEF. I have a caution all miners to beware of
the efforts of the said frauds to intimidate my patrons or extort money
from them by false representations. I have full patent for my Hy-
draulic Chief, granted Dec. 20th, 1870. No. of Patent, 100,922.

2v22-1ms F. H. FISHER, Nevada City.

THE WILSON
Patent Steam Stamp Mill.

This extraordinary Mill, now so justly popular in the
East, is now offered to the miners of the Pacific Coast.
Having been in operation now for about two and a
half years, the Company feel confident that the

WILSON STEAM STAMP MILL,
For Durability, Efficiency,
AND ECONOMY OF WORKING,
HAS NO EQUAL.

The Wilson Steam Stamp Mill is the only Steam Mill
that has had the severe ordeal of practical working, and
proved itself eminently successful. It is now in opera-
tion in several of the Eastern States and Territories, and
gaining an enviable popularity. The whole machine is
so simple as to be readily understood by the most ordi-
nary minds. In fact, its simplicity is its durability.
The expense of crushing rock or cement with this Mill
is less than one-half the expense of any other Stamp
Mill, and less than one-half the cost. For further particu-
lars inquire of

FURMAN R. WILSON,
San Francisco.

Or of THE WILSON STEAM STAMP MILL CO., 326
Walnut street, Philadelphia, Pa.

NOTICE.—All persons are hereby warned not to man-
ufacture or use any Steam Stamp Mills that are an in-
fringement on the Wilson Patents, as they will be
prosecuted to the utmost rigor of the law.

Varney's Patent Amalgamator.

These Machines Stand Unrivaled.

For rapidity pulverizing and amalgamating ores, they
have no equal. No effort has been, or will be spared,
to have them constructed in the most perfect manner,
and of the great number now in operation, not one has
ever required repairs. The constant and increasing de-
mand for them is sufficient evidence of their merits.

They are constructed so as to apply steam directly
into the pulp, or with steam bottoms, as desired.

This Amalgamator Operates as Follows.

The pan being filled, the motion of the muller forces
the pulp to the center, where it is drawn down through
the aperture and between the grinding surfaces.—
Thence it is thrown to the periphery into the quicksilver.
The curved plates again draw it to the center, where it
passes down, and to the circumference as before. Thus
it is constantly passing a regular flow between the grind-
ing surfaces and into the quicksilver, until the ore is
reduced to an impalpable powder, and the metal amal-
gamated.

Settlers made on the same principle excel all others.
They bring the pulp so constantly and perfectly in con-
tact with quicksilver, that the particles are rapidly and
completely absorbed.

Mill-men are invited to examine these pans and settlers
for themselves, at the office, 229 Fremont Street,
San Francisco.

PATENTS BOUGHT AND SOLD ON COMMISSION.

Longshores Combination Tool.

This device is just what its name indicates. As a KITCHEN TOOL it is indispensable. It will fit and lift with perfect safety, any Stove Lid, Frying Pan, Pie Pan, Pot, Kettle, or any other vessel or dish used about a stove. It is a complete tool for stretching carpets, driving tacks, pulling tacks, &c., &c. It answers the double purpose of hammer and pincers, and is also a good Nut Cracker. It is made of the best malleable iron, and the Hammer, Pincers and tack puller, are all hardened so as to stand the roughest usage. An Agent is wanted in every town on the Pacific Coast to sell this valuable little implement. Retail price fifty cents.

P. Davis' Wire and Picket Fence.

Although about two hundred different styles of fences have been invented and patented in the United States within the past ten years, yet this Fence, for GENERAL FARM USE, stands at the head of the list. This is a Virginia invention, and the actual cost of the Fence complete in that State is less than fifty cents per foot. Three men can put up six hundred yards per day. You men who are idle, why hang about the city talking hard times when you can make from five to eight dollars per day building this Fence? We will make a present of ONE FARM RIGHT in each county on the Pacific coast to farmers who will erect one hundred rods of the fence in good style within thirty days after the privilege is granted. We wish to employ several working men to travel in this State and Oregon. Price of territory, and circular with full description of fence sent on application.

New Gas Light.

This Light takes the place of the Candle, the Kerosene Lamp and Coal Gas. Each Lamp is a perfect Gas Factory, making its own gas as fast as it is required. It is a safe, cheap and beautiful light. Circulars and full particulars sent on application. A few good traveling agents wanted to sell this and other valuable Patents.

Hay Press.

The best and cheapest hay press in the United States. Presses furnished at manufacturer cost to parties buying County or State Rights. The profits on a few Presses will pay for a county Right.

Number 4.

Automatic Stop Governor.

In the accompanying engraving, a self-acting governor is illustrated, which not only regulates the flow of steam to the cylinder, but also serves as a stop-motion in case of emergency when the engineer is not close to the throttle-valve. The action is obtained by the construction of the valve and the operating mechanism.

The weighted lever, shown in the cut, connects with the valve-stem by a square socket, in which it is free to move up or down. This lever takes up the lost motion, in the joints and pins of the governor-arms, and partially balances the valve, rendering it easy to move and very sensitive to the action of the arms. By means of a set-screw on the standard, shown in the engraving, the opening of the valve is regulated so that the engine can be slowed to any degree or stopped. The weighted lever also furnishes a medium for regulating the speed.

The valve is a hollow cylinder, with four guiding wings, and three seats acting on

four seats in the chamber. Being hollow, and having clearance between the seats, it is balanced so soon as it is raised slightly from the seat, the steam pressing both on the inside and on the outside of it. So long as the engine runs regularly, the valve floats in steam and plays between the seats. If a belt breaks or runs off, the weight on the lever causes the valve to close on the upper seats, shutting off steam and stopping the engine, and thus, by automatic action, prevents the possibility of accident from any cause of the kind.

It will be seen from the above that great sensitiveness of action is produced without the use of springs or such high rates of speed as are generally necessary in order to control the speed of the engine. With this governor, the speed can be changed from one to twenty revolutions per minute, or *vice versa*, by simply changing the position of the compensating ball on the lever, without making any change in pulleys or stopping the engine.

The governor and valve are the subjects of three patents, issued in 1864 and 1865, and are very widely used in all parts of the country. They are manufactured by Gardner & Robertson, Quincy, Ill., and the agents for the Pacific Coast (to whom

address any enquiries) are Messrs. Darling & Co., 629 Washington street, San Francisco.

The Hesse Grinder and Amalgamator.

Our engraving represents a pan which was invented some time ago, but which the proprietors have been unwilling to present to the general public until they had made such alterations and modifications as should be suggested by working tests, and thus be able to have a perfected machine. They are now confident that their pan will work in a most superior manner.

HESSE'S PATENT GRINDER AND AMALGAMATOR.

The pan is intended for use behind a battery or, at least, on ore which has been reduced to a certain degree of fineness. That the principles on which it is founded in part may be more readily understood by our readers, to many of whom they will be new, we add a small sectional cut of one-half of the pan. The reduced ore and water are introduced through a central hopper, A, and pass down between wings, B, which, revolving, communicate motion to the mass. The centrifugal force thus imparted drives the current against the side of the pan and up chambers, C, arranged around the periphery. These chambers are lined with amalgamated copper plates. The current issues from the top of these chambers, and as it passes inward, such is its speed that the larger, and therefore heavier, particles fall down into the space, D, while the finer and lighter ones are carried over through separating channels, E, arranged on a revolving disk and of the construction denoted in the large cut, where the cover has been broken away to show them. From these the pulp passes into a revolving trough, F, containing mercury, down under an iron sleeve, up the other side of the trough to G, and thence out the discharge-hole. The heavier particles spoken of as falling down D, are here subjected to the grinding action of (horizontally revolving) shoes and (fixed) dies, and then join in the general current at H, passing

again up C, etc. The arrows show the directions of the currents. For the sake of clearness, the shoes are not shown in the cut. The die, I, is a band of iron, as denoted in the small engraving.

The revolutions of the moving parts are so regulated that the speed of the currents are kept under complete control, and thus the separation of the heavier and lighter particles can be effected with the utmost nicety. We have seen samples which were remarkably uniform in the size of the grains. In the revolving trough, F, the mercury necessarily assumes a position

The power (about 2-horse) required to drive the pan, is much less than is necessary for ordinary grinding pans, while the work accomplished is said to be treble in amount. From ten to fifteen tons of ore, as received from the batteries, can be treated daily, being reduced to a very fine and uniform powder. The quantity, of course, varies according to the hardness of the rock or the degree of fineness requisite. The machines require but little attention when once set in operation. The shoes and dies are the only parts subjected to much wear and are easily replaced or adjusted. The waste of metal, on account of the sorting of the ore, etc., is only two to two and a half pounds per ton of ore ground, it is affirmed, which is much less than is commonly the case.

The pans work continuously. The copper plates (10 square feet) and the arrangement of the mercury troughs afford every facility for amalgamation, forcing every particle of ore, as nearly as this can be done, to come in contact with the quicksilver. Moreover, the amalgam and quicksilver from the batteries are caught and saved. The device is available in the reduction of sulphureted ores, reducing the mass exceedingly fine and sizing the particles so perfectly as greatly to facilitate the concentration of the sulphurets, and giving a large percentage of gold over similar ores not thus ground and sized. The sulphurets are left in excellent condition for further treatment, and we are told that the cost of subsequent chlorination is \$5 per ton less than when the ore particles are coarse and unequal in size.

These machines are in successful operation at the Amador M. Co.'s mill, Sutter Creek; at Mormou and Poundstone's mill, same place, and at the Keystone mill, Amador City. We are told that the saving in quicksilver, as well as in gold, is very considerable,—an important item in these times.

The inventor, Mr. Hesse, of Oakland, is one of the very best mechanical engineers on the coast, and the millmen, who are part proprietors, have had every opportunity during the last three years of suggesting little modifications and improvements called for by working tests. Messrs. Lord & Peters, 304 Battery street, San Francisco, are agents for the pan and will give any further information desired.

The sorting of the particles before grinding prevents much wear on the shoes and dies. The amalgamated plates in the chambers, C, collect quite an amount of precious metal. We have no space to speak of other details, but the speed, size of chambers, apertures, etc., have been calculated to a nicety, and thus the whole process is kept under perfect control. Moreover the construction of the shoes, etc., to secure regular wear and working, have been carefully attended to.

PHOTOGRAPHS WANTED.—The publishers of the SCIENTIFIC PRESS and of the RURAL PRESS, being desirous of retaining more accurately in their memory the lineaments of their correspondents to whose interesting articles they feel deeply indebted, propose instituting a "Correspondents' Gallery," and therefore would be most pleased to receive the photographs of any and all of those who communicate with the papers. It is not proposed to "publish" these photographs at present, but it will be most pleasant to have the faces where they can be looked at, and where any reader or writer, on calling at the office, may have an introduction to those with whose ideas he or she has become acquainted. Will our many kind friends oblige us in this matter?

MECHANICAL PROGRESS.

BORING MACHINES AT MOUNT CENIS.—Prof. Ansted says it is a curious sight to see a workman connect an elastic tube of half an inch diameter with one of these machines, and watch the result when a tap is turned. A piston-rod, in a short cylinder, immediately flies backwards and forwards with wonderful rapidity, regulated by a small but rather heavy fly-wheel. Immediately a ponderous chisel, 6 or 7 feet long and more than an inch in diameter, is set in motion, and strikes a succession of heavy blows against the stone. Each time that the chisel strikes it is withdrawn a little way, slightly turned, and immediately strikes again in the same hole. The stone experimented upon being of the hardest and toughest kind, the effect is not seen for several strokes; but within two minutes, a steel chisel was completely blunted, and there was a hole two inches deep in the mass of quartzite. Holes are bored in this way in an hour that would formerly have taken a day. The machines occupy very little space, and can easily be moved where needed. As many as seventeen are at work together in the end of the tunnel. As the power is compressed air, they not only add no heat to the interior, but render it cooler by the absorption of heat during expansion. The air, when it escapes, is available for ventilation. It would be quite impossible to carry steam at a high pressure through pipes four miles long, but little diminution of force is experienced in working with the air, although all the engines and condensers, as well as the cylinders for storing the air, are outside the mouth of the tunnel. The length of pipe at present on the Piedmont side is four and one fourth miles. The pressure of air commonly employed is six and a half atmospheres, or nearly 100 lbs. on the square inch.—*Sci. American.*

LOCOMOTIVES FOR CANADA.—The Rhode Island Locomotive Works have a contract with the Great Western Railway of Canada to supply that company with thirty-two locomotives. Sixteen have been already shipped, this week seven more were sent, and the remaining nine will follow this month. The engines have cylinders sixteen by twenty-four inches. The driving wheels are five and one-half feet in diameter. The fire boxes are built of steel, and everything about them is composed of the very best material. They have a railing a few inches high around the top of the tender, and the bell, which is on the forward platform, is kept incessantly ringing when the engine is in motion by its being connected with the eccentrics.—*Chicago R. R. Gazette.*

WOOD-SAWING MACHINE.—A machine recently designed in Minnesota, more particularly for railroad work, is thus described by a local paper: "It consists of two saws so placed that two cuts can be made at once. The wood is fed to these as grain is fed into a threshing machine, and after being sawed is carried away by an elevator, like the threshed straw. The machinery is propelled by an eight-horse power engine. The whole apparatus, engine, boiler, saws and elevator, is built upon a platform, and enclosed like a box-car, in convenient compass to be loaded upon a flat-car, and shipped from station to station. With a little change, trucks can be placed underneath like a pile-driving car, and then it can be moved upon the track as a separate car. In ten hours it can prepare from 90 to 100 cords easily. It requires nine men to work it, feed and take care of the wood."

"FRET" MACHINES, FOR CUTTING PATTERNS.—The London *Mechanics' Magazine* describes specimens shown at the Workmen's Exhibition. "They are very simple in construction; they consist of a table upon four legs, with a cross-bar to carry the treadle or foot-rest, and which has a strip of vulcanized rubber attached to it for connecting the lower end of the saw. This saw then passes through a hole in the table, and is fastened at its upper end to another elastic strip, which is suspended from an arm springing over to the front from the back of the table. The motion is obtained from the movements of the treadle by the foot, with a small amount of labor, the upper elastic strip being strained to a pressure of about 30 pounds in first setting the saw; the rebound of the saw is easy, so that the fatigue of the foot is reduced to a minimum."

GAS PURIFICATION.—ST. JOHN & CARTWRIGHT.—The above named parties prepare a composition for gas purification from the Staten Island iron ore, a natural product which is found to combine the essential conditions of a gas purifier in a remarkable degree. It is a nearly pure limonite, highly porous and granular. Prof. H. Wurtz sets forth the importance of the improvement in the *Gas Light Journal*, and adds:—"The patented device of these gentlemen, also, for increasing the permeability of the mass, without introducing any inert matter, by using waste borings and turnings of iron for this purpose, (instead of sawdust, straw, etc., as in European practice,) is highly ingenious and valuable. The metallic iron thus introduced is useful from the start, and is gradually converted into a highly active hydrated oxide, so that the improvement of the new composition by use, is of the most marked character. Every time it is used, after revivification, until too heavily charged with sulphur, it improves in power and endurance. (We shall very shortly lay before the public some marvelous facts under this head.) A more striking example of the "killing of two birds with one stone," has rarely occurred in the history of human invention; and it is one of those applications which, from their simplicity, excite wonder that they "never were thought of before."

CONNECTICUT MANUFACTURES.—We select the following from the January "Notes" of the *Manufacturer and Builder*: The shops of the Colt Firearms Co. at Hartford are now running on the Gatling gun, upon which Mr. George Kinne has made important improvements. One of these is the mounting it upon a turn table which gives it command of a range of 15°; and he has moreover added an automatic arrangement which gives it at will a continual change of range by the simple turning of the crank used to discharge it. The Weed Sewing-Machine Works, adjacent to the above, employ 200 hands and turn out 170 finished machines daily. The buildings are soon to be enlarged. The various parts of this machine are made by special machinery. The Cheney Silk Works in Hartford, and in Manchester, eight miles distant, cover two and a half acres, and employ 1,000 persons, mostly women. They consume 200 pounds daily of raw material, and produce silks of such excellence that A. T. Stewart, "the shrewdest merchant in America," contracts for their entire product.

AMERICAN RUSSIA IRON.—We clip the following from the Philadelphia Cor. of the *Iron Age* Jan. 5th: "As is well known to the trade, the secret of manufacturing an article of sheet iron possessing the qualities and finish of Russia iron has never been successfully attained here or in England. We have, it is true, imitations which, while to the eye nearly as good, do not possess the durability for which the Russia iron has been so celebrated. A firm in this city claims to have discovered the method of manufacturing an article fully equal to the best Russia iron without the use of acids, and at a cost not exceeding that of our ordinary sheet. We are promised full information in regard to the process."

RUBBER TIRES FOR RAILWAY WHEELS. An English patent has been taken out "for the adaptation and application of vulcanized india-rubber bands to the tyres of locomotive and railway wheels generally. For this purpose is employed a strong endless band of rubber, of the width of the tyre of the wheel from the inner side of the flange to the outer face, and of such a thickness as will be regulated by the weight of the carriage, but in no case less than two inches thick when in position. The diameter of the band should be so much less than the diameter of the wheel as to require considerable force to stretch it to the circumference. The inner side of the band is previously coated over with cement, by which it is secured in its place. Segmental pieces of tough wood or metal are secured to the outer face of the tyre so as to confine the band laterally."

NEW MAIL LOCK.—They are now making at Colt's factory a new patent lock for the United States mail bags. When fastened, a numbered plate of glass covers the keyhole, and this glass has to be broken before the bag can be unlocked or the lock tampered with. It is said to be the most complete lock ever invented. Five thousand of them have been ordered by the Post Office Department.—*Iron Age.*

SCIENTIFIC PROGRESS.

CAUSE OF THE MOTION OF GLACIERS.—J. Croll, of the Geological Survey of Scotland, contributes an article upon this subject in the *Philosophical Magazine*, in which, after noting the fact that the ice of a glacier, though solid, nevertheless behaves in some respects like a plastic substance, he shows that it shears as it descends, in such a manner as to prove that some other force in addition to gravitation must be in action, that alone being insufficient to account for the phenomena. What, then, is that force? It is found that the rate of descent depends upon the amount of heat which the glacier receives. But in what way does the heat aid gravitation? We quote: "There seems to be but one explanation (and it is a very obvious one), viz: that the motion of the glacier is molecular. The ice descends molecule by molecule. The ice of a glacier is in the hard crystalline state, but it does not descend in this state. Gravitation is a constantly acting force; if a particle of the ice lose its shearing-force, though but for the moment, it will descend by its weight alone. But a particle of the ice will lose its shearing-force for a moment if the particle loses its crystalline state for the moment. The passage of heat through ice, whether by conduction or by radiation, in all probability is a molecular process; that is, the form of energy termed heat is transmitted from molecule to molecule of the ice. A particle takes the energy from its neighbor, A, on the one side, and hands it over to its neighbor, B, on the opposite side. But the particle must be in a different state at the moment it is in possession of the energy from what it was before it received it from A, and from what it will be after it has handed it over to B. Before it became possessed of the energy, it was in the crystalline state—it was ice; and after it loses possession of the energy it will be ice; but at the moment that it is in possession of the passing energy is it in the crystalline or icy state? If we assume that it is not, but that in becoming possessed of the energy it loses its crystalline form and for the moment becomes water, all our difficulties regarding the cause of the motion of glaciers are removed."

PLATINUM FUSIBLE WITH THE COMMON BLOWPIPE.—W. Skey, of the New Zealand Geological Survey, finds that if the loss of heat by conduction be guarded against, platinum can be fused with an ordinary blowpipe blast through a candle flame. He substitutes for the metallic nozzle, a tube of clay or glass. We quote him from the *Chemical News*:—"By this means, fine platinum points were fused in an unmistakable manner to beads. The blast was that ordinarily used in the laboratory by the use of the hydrostatic blowpipe, the flame being that of a stearine candle. As it might be urged that, perhaps, the platinum I treated might contain an admixture of more fusible metal, and that its melting-point might thus be reduced, I prepared some of the platinum for special trial, which was absolutely free from such fusible metals. As the fusing point of platinum has been ascertained to be 4593° F., we must, from the above experiment, conclude, that if proper precautions are taken to prevent loss of heat by conduction, this high temperature can be produced by the ordinary blowpipe operating upon flames of this description."

DIFFERENT ALCOHOLS.—In an article on the alcohol of wine by Dr. Rabateau, in the *Union Medicale*, we find the following:—"Two important alcohols are to be considered in relation to the fortification of wine (vinage)—the amylic, which is very toxic, and forms the major part of the residuum of brandy made from fecula and beet-root, and is found in that of brandy made from grapes, apples, etc. (*eau de vie de marc*), but not at all, or in inponderable traces, in that made from wine; and the butylic, less toxic than the former, but still slightly so, which was discovered by Wurtz in the residuum of the distillation of brandy from fruits (*eau de vie de marc*), and produced in considerable quantity in the fermentation of the molasses of beet root. The partisans of alcoholization of wine pretend that that of potatoes and beet-root, which are now articles of commerce, are as pure as that of wine, and contain neither butylic nor amylic alcohol. This is a mistake; for it is extremely difficult to purify the spirits of fecula and beet-root from these butylic and amylic alcohols."

THE GEOGRAPHY OF THE SEA BED.—This was the title of a paper read by Capt. S. Osborn, R. N., at a late meeting of the Royal Geographical Society. We quote from a notice in *Nature*: "It has been definitely ascertained that the greatest depth of the ocean does not reach 3,000 fathoms in any part where telegraphic lines have been laid. The bed of the North Atlantic consists of two valleys, the eastern extending from 10° to 30°, the Western from 30° to 50° West longitude. The extreme depth of the eastern valley is under 13,000 feet, which is less than the altitude of Monte Rosa. This valley has been traced southward to the equator. It is separated from the western valley by a ridge in 30° West long., in which the average depth is only 1,600 fathoms. This ridge terminates to the north in Iceland, and southward at the Azores, so that it is volcanic in its character at both extremities. Its extreme breadth appears to be under 500 miles, and the Atlantic deepens from it on both sides. Explorations carried on in the Mediterranean, the Red Sea, and the Indian Ocean, showed similar uniformity in the level of the sea-bottom; and the general conclusions arrived at by Capt. Osborn were that in the deep sea there is an absence of bare rock, and that there are no rough ridges, canons, or abrupt chasms. Moreover, that the bed of the deep sea is not affected by currents or streams, even by those of such magnitude as the Gulf Stream; but that it rather resembles the prairies or the pampas of the American continent, and is everywhere covered with a sort of ooze or mud, the debris of the lower forms of organic life."

GLACIERS, NOT ICEBERGS.—Prof. J. D. Dana has an article in *Silliman's Journal* on the question whether the glacial era in Central New England was an era of glaciers or of icebergs. American geologists are divided in opinion. We give the conclusion: "The facts show, beyond question, that in the Glacial era the transported blocks came from the comparatively low regions, in the very bottom of the supposed Iceberg sea, not far to the north of New Haven, instead of from distant and elevated heights to the northeast and northwest; and this was true of all the drift material. The observations of others over New England, as well as those I have made over Connecticut, sustain the conclusion that the sand and gravel of the unstratified drift has not come from remote points, but has been shoved southward by some agent that could gather it up over the breadth of the land and bear it onward to drop it after a few miles, or scores of miles of transportation. All this is evidently entirely impossible work for icebergs. Since, then, icebergs cannot pick up masses tons in weight from the bottom of a sea, or give a general movement southward to the loose material of the surface; neither can produce the abrasion observed over the rocks under its various conditions; and inasmuch as all direct evidence of the submergence of the land required for an iceberg sea over New England fails, the conclusion appears inevitable that icebergs had nothing to do with the drift of the New Haven region, in the Connecticut valley; and, therefore, that the Glacial era in Central New England was a *Glacier* era."

GEOLOGICAL SURVEY OF CALIFORNIA.—The first volume of the Ornithology, soon to be issued, is a royal octavo of 592 pages, containing 662 cuts. The *American Journal of Science and Arts* speaks thus of it: "This admirable report is far in advance of any similar work on Ornithology hitherto published in this country, if not in Europe, and does great honor both to the State of California and the officers of the Geological Survey. The first volume contains descriptions of all the land birds hitherto found in the region north of Mexico and west of the Rocky Mountains. Each genus is illustrated by a reduced full length cut of one of the species, and by natural size cuts of the wing, tail, bill, and foot, which will render it very easy for any one to recognize each genus, while nearly all the species are illustrated by full size cuts of the heads, often of both male and female. The cuts are nearly all original and have been drawn and engraved with great care and skill. The cuts are, in our estimation, superior both in accuracy and beauty to any hitherto published in any work on ornithology, and are far more satisfactory than the highly colored, but often coarse and inaccurate, lithographs, so often employed to illustrate ornithological works."

CORRESPONDENCE.

Bound East.

Omaha to Chicago.

Written for the Press.

The traveler who intends going from Omaha to Chicago may find himself involved in a puzzling predicament, rather similar to that in which a famous English wit was once placed. No doubt you are all familiar with the story, but yet I'll risk repeating it. The gentlemen referred to, while nursing in a grave-yard, found the following inscription on a tomb-stone:

Stranger, reflect, while you pass by;
As you are now, so once was I:
As I am now, so you must be;
Therefore prepare to follow me.

After reflecting, the wit added these lines:

To follow you, I'm not content,
Unless I know which way you went.

In a similar manner, I was rather troubled how to get to Chicago, for there are three roads, making the connection, to choose from, viz: the Chicago and Northwestern, the Chicago, Rock Island and Pacific, and the Burlington and Missouri River. I pondered over the matter, questioned every one who had tried either route, and finally made up my mind. My experience then and since has confirmed me in the belief that I went the best way.

The Burlington Route

Isthe one I selected. I found that the road was well built and passed through fine scenery and by points which one wishes to see, that the cars were of the most comfortable description, the employees attentive and polite, and the time reduced to a minimum with due regard to safety. The road runs in quite a direct line, the road bed is excellent, the iron, the heaviest in use in America, weighing 65 lbs. to the yard, and there being a double track part of the way. The passenger cars are sumptuous, — Pullman Palace Drawing Room, Sleeping and Hotel Cars, Saloon Smoking and Passenger Coaches, and Pullman baggage cars, — yet the prices are not higher than elsewhere. The passenger cars are furnished with Miller's patent couple and buffer, are lighted with gas and heated with hot air. The sleeping cars have Baker's patent car warmer and other improvements. Even the second-class cars have cushioned seats and run through on express trains.

The country passed through is delightful. We first ride for 20 miles on the Missouri Bottom, formed by river deposits. Then we rise up, riding over rolling prairies and crossing numerous streams skirted with trees. Herds of cattle, from Texas, graze alongside of the track. At Glenwood we see the Soldiers' Orphan Asylum, and in this vicinity hedges of *Osage Orange* are frequent. At Red Oak we connect with the train from Nebraska City, from Kansas City and Denver, Colorado, even. Our road ascends gradually up to Creston, about 80 miles from the Missouri River, and thence we have a descending grade to the Mississippi, at Burlington. As we continue on, better country is found, better villages are seen. Near Ottumwa we cross the Des Moines River, and near Mount Pleasant, the Skunk, — euphonious stream. As we approach the Mississippi we view fine vineyards, and finally, after having crossed the whole width of fertile Iowa, we reach the Father of Waters at Burlington.

Here we roll into Illinois over the great iron bridge, which spans the Mississippi. This splendid structure rests on nine piers, is 2,200 feet long, and has a draw 360 feet long opened and shut by steam power. In two hours we come to Galesburg, a great railroad center and manufacturing site. We now come into the garden spot of Illinois, which extends along for a width of 150 miles, is dotted with fine villages and handsome country seats, is covered in summer with waving oceans of grains. Over the flat prairie, with the richest of soil and the best of cultivation, we rush along, seeing new beauties appearing and disappearing every moment. At Aurora we find a new town which is old in wisdom. Here

is a schoolhouse which cost \$80,000. Near Chicago we pass through the charming suburban town of Riverside, and finally, with a splendid view of lake and city, we arrive at our destination. W. H. M.

Notes of Travel in San Joaquin County.

Fine Ranches.

(Continued from page 35.)

Mr. Dodge is also the proprietor of 550 acres of fine land at the same place, all of which is under cultivation. He has a vineyard of 50 acres, and proposes to set 50 acres more of vines this year. He harvested 250 acres of wheat and 40 acres of barley last year.

Mr. Shippee, of the firm of Shippee, McKee & Co., has one of the finest ranches in the country. It is situated five miles north from the city, on the Calaveras river, and comprises 600 acres. The river is on the east or upper side, and the Cherokee Lane Gravel Road runs through its center. The ranch consists entirely of bottom land and can be irrigated at any and all seasons. At the season of the drought, it was irrigated and produced 40 bushels of wheat per acre, and two tons per acre of the best of oat hay. Last year it was again irrigated and the grain sown in January and February, produced 35 to 40 bushels of wheat, 40 to 50 bushels of barley, 50 to 75 bushels of

burned out, starting again without a cent. Nearly all of the principal tanneries in this State are now owned and run by many who first learned the trade of Mr. W.

Lane's grist-mill cost about \$50,000, and is owned by R. B. Lane. It contains six run of burrs, is run by a steam engine with 18-in. cylinder and 36-in. stroke, has two boilers, 52 inches in diameter and 16 feet long, containing 46 4-in. tubes. Its capacity is 240 barrels per day. They run only 190 days on the average per annum, and made last year 14,000 barrels of flour. They consume about 600 tons of coal per annum.

The State Insane Asylum, (G. A. Shurtleff, M. D., Supt., A. Clark, M. D., and J. Titus, M. D., Assistant Physicians,) on the first of January, 1871, contained 1,000 patients—766 males and 294 females.

Grapes and Wine.

Among the best varieties grown here for market are the Black Hamburg, Black Malvaia, Black Prince, Black Ferrara, Reine de Nice, White Muscat of Alexandria, Black Morocco, Madeline, and Chasselas-Fountainbleau. For wine, the White Tokay, Chasselas-Fountainbleau, White Fontignan, Moselle, Chasselas-Musque, Red Fontignan, Black Burgundy, Zinfandel and Black Malvasion.

For port and sherry, for which this county is peculiarly adapted, the California grape is used. All the premiums given by the Horticultural, Agricultural and Pomological Society, of San Francisco, and by the State Agricultural Society, were for sherry made near Stockton. The climate

kind in the State. He is not for sale. The roadsters are from the Chieftain and Black Hawk stocks. At the State Fair in 1869, Mr. O. took the first premium on two-year old bull; first premium for best thoroughbred Durham milk cow; first premium on best calf; first premium for best three-year old heifer; also for best two-year old, and first for best yearling; also first premium for the best herd, which is a much better endorsement than I could possibly give you in an article of this length.

Farm Implements.

Mr. O. was the inventor of a *Hay and Grain Elevator*, the fame of which in this County is sufficient without a word from me. He also is interested in and has practically used the *Self Adjustable Harrow* of Mr. David Gills. This harrow is 7x9 ft, and made to be coupled together side-wise in gangs of three or less. With a gang of three, with ten mules, it will harrow a strip 21 ft wide and accomplish 30 acres per day. Each section has eight adjustable cross pieces, with eight steel teeth in each, and when in motion, no two teeth follow each other. Although the teeth are nine inches apart, four of them are so arranged as to thoroughly harrow under the side piece, which is needed when used as gangs. This harrow never clogs, the cross-pieces each being connected by a lever in the rear so arranged as to throw the teeth at any angle from a simple movement of the lever, any ordinary obstacle is over come. Two small ten-inch wheels are used, one on either side, in front, which prevent its miring in soft ground, or clogging in rough ground.

I consider it the best harrow in the State. Each section works independently, and can be used separately, like any others.

An arrangement of the Header-Bed has been conceived by Mr. O. which I think will come into general use. Its peculiarity is that it can turn a square corner, although the bed is 20 ft long. The hind wheels of an ordinary wagon are placed upon spindles arranged on the hind part, and the forward wheels so arranged as to come under to the center. Upon the whole this farm is as complete in working trim as any in the County.

Sargent Brothers Ranch.

Is situated about five and a half miles from Woodbridge and fifteen miles N. W. from Stockton. It consists of Tule, Overflow, and Upland. The entire Tract contains about 10,000 acres, about 6,500 acres of which is Tule, about 1,500 of Overflow, and 2,000 Upland. The former is bounded on the west partly by the Mokelumne

River, on the south by Treadway Slough, on the east by the Overflow and Upland, and on the north by Island Mouth and Sycamore Slough, a large portion of which is so far reclaimed as to prevent any overflow except during an extreme flood, which would cover the entire tract of tule and overflow. The Sargent Bros. have been constantly engaged in ditching and building levees since 1864. For the six months just past from 10 to 40 men have been employed. Some 10 miles of levee and ditch have been constructed, costing from \$15,000 to 20,000 thus far. Now, in the driest season, the grass is from eighteen inches to three feet high, and the cattle are in as fine order here as any on the uplands in the best season. They have a large number of horned stock, and eventually will have one of the best stock ranches in the State. The Sargent Brothers, four in number, each equally interested, own and run three extensive stock ranches, Dr. J. L. and Ross Sargent attend to the affairs of the one above mentioned; J. P. Sargent attends to the one near Gilroy, consisting of one league of land; and B. B. Sarge attends to about three leagues of land at Monterey, all of which are well stocked with cattle, etc. They will farm on the uplands of the (San Joaquin Co.) ranch, this year about 700 acres of grain, wheat and barley. I had the pleasure of a ride over this entire ranch this week, and points passed over by us in a buggy, I was informed three or four years ago were only accessible by a boat.

L. P. MC.

WHITE PINE BULLION.—From January 1st, 1870, till December 31st, Wells, Fargo & Co. shipped from their office in this city, says the *White Pine News*, the following amount of bullion, which was produced only by mills in this district: Shipped West 647 bars—value, \$738,802 78; shipped East, 642 bars—value, \$851,852 88. Total, 1,289 bars; value, \$1,590,655 66.

oats and two and a half tons of hay per acre. He has this season about 350 acres in wheat, oats and barley, and about 150 acres in meadow for hay and the balance in pastures, orchards, etc.

His stock consists of fine horn stock and Essex and Suffolk hogs, while his horses are among the best of trotters. Among them may be mentioned the brood mares "Lady Fine" and "Lady Me," and several of the Belmont and Blackhawk stock. He claims to have 20 of the best trotting colts in the county. He also owns the young horse "Tidal Wave," and the "American Boy." For one of his colts he has been offered \$1,000; this colt has trotted in the forties. His motto is the best or none. He says it costs no more to raise a good horse than it does a poor one.

FINE POULTRY.—I had the pleasure of seeing the finest lot of poultry, a few days since, that I think there is in the State. They are of the "Light Brahma" breed, imported from Massachusetts, and New York, by John Sedgwick, Esq., of Stockton.

Stockton Manufactures.

The Pacific Tannery, Kullman, Wagner & Co., makes a specialty of sole, harness and upper leather. Here twenty-five men are regularly employed, and when working to their full capacity they turn out 2,000 sides per month; now, however, only about 1,200. The annual production is from 20,000 to 24,000 sides.

Wagner & Harrison's tannery, situated in the rear of the insane asylum, is doing a fair business in a small way, working at present five men. Of Mr. J. C. Wagner, one of the proprietors, especial mention is merited, he being the pioneer on the coast in this business. He started here first in the year 1852, and has been several times

is so warm that all the varieties ripen to perfection. The California, Black Prince and Zinfandel, will produce from eight to twelve tons to the acre, on vines eight and ten years old, and in some seasons even more have been raised. As high as \$500 for California, \$1,500 for Black Prince, per acre, has been realized here; the grapes being shipped to San Francisco.

For raisins, the White Malaga and White Muscat of Alexandria, are used, and make raisins as good as the imported. The Fifer Zagors is too soft, and rots in many localities.

Ranches—Stock.

William L. Overhiser's ranch, of 800 acres, is situated four miles northeast from Stockton, on the Waterloo gravel road. It lies on both sides of the road, and its soil is in as fine condition at this writing as many I have visited in better seasons, i. e. for rain, less than three inches having fallen yet. He will farm about 400 acres in barley this year—his principal product in cereals.

His fine stock consists of about 100 head of horses and mules, about 30 head of fine cattle, and about 2,500 head of thoroughbred sheep, and will have 600 head of Spanish Merino bucks for sale this season. This band of sheep is the largest on this coast, if not in the United States, of thoroughbreds. C. C. Smith, however, is interested in this portion of his stock. His milch cows are as fine a lot of Durhams as I have ever seen, for size, build, and milk-giving qualities; all of the short horn and short-legged breed. His bull, Grand Turk, of Oak Home, is a monster, measuring eight feet in length from his pate to his haunches, and stands five feet high. His breast hangs within eighteen inches of the ground. He weighs 2,000 pounds, and his pedigree is recorded in the American Herd Book, on page 195, article 8,258; he will be five years old next May and is valued by Mr. O. to the extent that he would not swap him for any other of his

MINING SUMMARY.

The following information is gleaned mostly from journals published in the interior, in close proximity to the mines mentioned.

California.

ALPINE COUNTY.

THE GLOBE MILL.—*Chronicle*, Jan. 14th: The machinery is being put in position as rapidly as possible. Now that the Marion claim has been purchased by the Globe Co., we have more confidence in the ability to ship bullion during the summer—providing the new process can do all that is claimed.

LEVATHAN.—*Miner*, 14th: Good as the ore has been in this mine, we saw some samples this week which eclipse anything before found. What is better, this ore was found in one of the drifts of the upper works, where no ore has been heretofore struck. Two men were set at work, and before picking an hour struck a large body of ore, from which they took out over seven hundred dollars' worth, dump value, during their shift.

TARSHISH.—Fine ore continues to be found in the two Tarshish claims of the Monitor & N. W. and Silver Glance, indicating fairly that the drifts are in the right direction for the main body.

BUTTE COUNTY.

ANOTHER IRON PIPE FOR CHEROKEE.—The *Butte Record* learns that the Cherokee Mining Co. have determined to bring water on to their claims. The water is taken from Butte creek, and from a point known as "Old Kunkle Ranch" to Cherokee will have to be carried in an iron pipe. This will require some six or seven miles of pipe. We are assured that work has been commenced on this ditch.

CALAVERAS COUNTY.

WHAT CHEER.—*Chronicle*, Jan. 21st: Work has been commenced in earnest upon this mine in Chili Gulch. The necessary buildings are erected, the machinery upon the ground and everything in readiness. An incline tunnel, 480 feet in length, with a dip of five feet in twelve, will have to be run to reach the channel. Work is already commenced upon it.

WATER.—There is now a full head of water in the ditch and miners in every direction are busily employed. The quartz and cement mills are again in active operation.

EL DORADO COUNTY.

THE DITCH PROSPECT.—*Placerville Democrat*, Jan. 21st: We have reliable information that there will be no conflict between the rival companies who are asking aid of Congress to assist in the construction of the greatly needed canal through this county.

CLARKSVILLE.—A correspondent writes to the *Union*, January 13th: The placer mines in this vicinity are attracting some attention. There are ten or twelve companies in successful operation. I was informed yesterday that one company had last week realized to the hand as high as \$20 per diem. There is one company about starting a hydraulic power in the American ravine, to wash over the old diggings heretofore worked with picks and shovels. The Eureka Ditch Co. have repaired their ditches and will in a short time be able to supply an abundance of water cheap.

INYO COUNTY.

KEARSARGE.—*Inyo Independent*, Jan. 14th: Last week two large teams from Reno, loaded with machinery for the Kearsarge improvements, arrived at the mine. The *Gold Hill News* of Jan. 12th, says that an assay made at that place of ore from the croppings of the Kearsarge at the foot of the mountain, showed silver \$657 per ton.

NEVADA COUNTY.

NEW YORK HILL.—*Grass Valley Union*, Jan. 20th: We learn that arrangements are being made to start the New York Hill mine and mill in operation at an early day. This mine in times past paid well.

THE RAIN.—*Transcript*, Jan. 24th: On Sunday rain commenced, and up to the present time we have the most favorable storm for mining interests that we have had during the season. There are hundreds of hydraulic claims waiting for water to commence working. Up to Saturday there was not more than 900 inches of water at the head of the South Yuba Co's ditch. Notwithstanding this, it is not yet too late. In Eureka, Nevada, Grass Valley, Washington and Little York, very extensive claims have been fitted up, and the amount of washing done may be far beyond any previous season.

RIOH PROSPECTS.—We understand the Kansas Co. have run around the boulders

which they struck in the drift, and reached pay gravel which prospects exceedingly well.

OSBORNE HILL.—*Grass Valley Union*, Jan. 24th: The company are doing well. Pascoe & Co., who are taking out rock on shares with the company, are also doing well. A clean-up from 116 tons of rock has given \$48 per ton, or a total of \$5,568.

GRAVEL.—The rain has caused the gravel diggers to rejoice. Yesterday Webster & Co. started up steam on their hoisting and pumping engine, and in a few days will have their mine free of water, and have also plenty of gold-bearing gravel ready for washing. McSorley & Co. also started up yesterday. A "Shoo-Fly" nozzle has been put up, and water turned on, which made the gravel bank rapidly melt away. The miners of Randolph Ridge are all at work.

SOUTH STAR MINE.—The steam hoisting works were started up on Saturday afternoon, with appropriate ceremonies. We can only say, before our regular report of the "Mining Situation," that the machinery is working satisfactorily, and that the ledge is looking well.

PLACER COUNTY.

SOON AT WORK.—*Herald*, Jan. 21st: We learn that the Graves-Putnam mill, on Baltimore ravine, one mile from town, is almost completed and will be at work in a few days, as there is plenty water in the ditch to furnish the power. The ledge is known as the Marcellus.

INTERESTING CORNER.—There are some rich quartz ledges centering on Baltimore Ravine, nearly all of which are on patented lands. Two Companies working close together on the same ledge, or on ledges that cross each other, have taken leases from the owners of the land—one for three and the other for five years, each to pay five per cent. of the gross proceeds of the mines.

QUARTZ.—*Stars and Stripes*, Jan. 19th: Hon. M. H. Power, writes us from Damascus, Jan. 5th: "Messrs. Dovers, Linn and Brown have discovered a quartz ledge on the ridge, near the North Fork of the American river, one mile above the mouth of Humbug Canyon."

PLUMAS COUNTY.

SAWPIT FLAT.—*Quincy National*, Jan. 14th: The miners are patiently waiting for water, having filled their dump houses to their utmost capacity. We are informed that most of the pay dirt taken out during the summer has been rich.

GOVERNMENT PATENTS.—A number of the miners in this county are making arrangements to secure their titles.

STARTS WELL.—Messrs. Ray & Concklin started up their new mill at Argentine, this week, and everything worked smoothly. It will be some weeks before a clean-up can be made, but no doubt of the successful working of the rock is entertained.

RICH STRIKE.—For some time Blakesly, Braden & Co., have been running a prospecting tunnel in the old Deadwood claim on Emigrant Hill, near Elizabethtown. One day this week they struck pay gravel, and we are informed that from five pans of dirt they took out \$230. The crevice is a large one and promises to be extensive. The gold is all coarse—pieces weighing from one dollar to fourteen.

SAN DIEGO COUNTY.

FROM THE MINES.—*Union*, Jan. 12th: Mr. A. Pauly arrived from Julian and Banner Districts on Tuesday. The new "Banner" District, in San Felipe Cañon, is growing rapidly, and money is more plenty than it has ever been in Julian. Mining affairs in the Cañon look well for permanence. McMechan's "Pioneer Mill" has been moved there, and will be running in a few days. McKean, of the Warlock mine, has put up a wooden mill, run by horse power, and is netting \$100 per day. Eight or ten arastras are doing well. Parson's mill is running night and day on Van West ore. A clean up of Helvetia ore just made at that mill yielded 105 ounces gold from 84 tons.

SHASTA COUNTY.

FRENCH GULCH.—*Cor. of Courier*, Jan. 21: There are many good paying claims here, but no water to work with. Quartz mining is depressed in a great measure from the same cause. The Washington Co. have been compelled to hang up ten stamps, and have barely enough to run the remaining twelve. The mine shows better prospects than at any previous period. The ledge is large, and the quartz rich. But two men are at work on the Highland at present.

SIERRA COUNTY.

ITEMS.—*Messenger*, Jan. 21st: The Chinamen have succeeded in mining out the ground, lately owned by A. J. McKinsey, on Durgan Flat, and it has proved rich. Work has been suspended on the Iowa

Claim, and will not be renewed until Spring. The prospects are that the business matters of the Independence mine may be soon arranged, so as to resume work. The parties who have purchased the Hog Canyon mine have been trying to open the trail for the purpose of commencing work, but have found the snow ten feet deep. We are warranted in saying that the Primrose mine is to be fully tested.

PORT WINE.—*Cor. of same*: The Monte Cristo boys are still digging away on rich gravel; the drawback is the decrease of water, but it is hoped that we shall soon be visited with a rain storm to give us water enough to wash up.

SOUTHWEST SIERRA.—*Camptonville cor. of Democrat*, Jan. 19th: At Weed's Point is a large body of mining ground worked by the Sailor Bros., and paying. Passing on to Oak Valley, we come to a small camp of about fifty miners, waiting for water. At Brandy City, P. S. Van Rensselaer owns a large amount of mining ground and is working to win. He was blasting the bank most of last summer. He has put off six blasts in all; the largest 175 kegs, and the smallest 50 kegs. The ground is considered rich. Messrs. Arnott, Pender, Jenkins & Co., have just washed some dirt taken from the bed-rock this last fall which paid handsomely. Mr. J. Jones has a claim that is considered good. At Grizzly Hill, are some good claims owned by Sharpe & Bro. and Selfridge & Co. They are ready to work as soon as water comes in. The next is Indian Valley. Here Sam Fisher and Sam Boustine have claims that are valuable. Corey & O'Roar of this place have purchased half an interest in the "Waxey Claims," owned by Baker & Landacre, which have paid well.

SISKIYOU COUNTY.

ITEMS.—*Yreka Journal*, Jan. 18th: Edgerton, Ketchum & Co., who have been making extensive preparations for mining this winter on Yreka Flats, getting tired of waiting for water, have determined on cutting a ditch to conduct water from Greenhorn Creek. The Steamboat claim, formerly owned by E. Steele, paid handsomely from two days last week, but as the weather turned cold and froze up their water, the miners were compelled to suspend. Scott River is still low, but the miners took out their apparatus in fear of a rise, and of course are unable to do anything at river mining. A man named Swan has found very rich prospects in a quartz lead on the opposite side of the river from the Dean claim.

TUOLUMNE COUNTY.

TUNNELING TABLE MOUNTAIN.—*Sonora Democrat*, Jan. 21st: We learn that a company from Monterey county has been formed for the purpose of mining in Table Mountain, near Mountain Brow, on Mormon Creek. They have already tunneled into the mountain two hundred and seventy-five feet and have struck pay dirt that gives encouragement to proceed. They intend running into the old Caldwell garden, where several good sized piles were taken out a number of years since. The name of the company is the San Jose Mining Company.

CONFIDENCE MILL.—The last six days' running produced \$13,000.

Nevada.

ELY DISTRICT.

BOWERY.—*Record*, Jan. 15th: This ledge is three-quarters of a mile from Pioche. Spear, Whitman and others have been working on it for several months, occasionally striking a rich pocket which would pay enough to keep on with the work. Finally they have struck the ledge, and are taking out No. 1 ore.

WASHINGTON.—This mine, owned by P. McCannon and others, has 25 Mormon teams hauling rock to Meadow Valley, to lie there until the Chicago mill is erected.

BULLION.—The shipments for the week ending Jan. 13th, through Wells, Fargo & Co., amount to \$31,666. The shipments from Elyville amount to \$16,280, making the total \$47,946 for the week.

EUREKA DISTRICT.

WINTER MINING.—*Sentinel*, Jan. 21st: During the summer it was thought that the winter would be too severe to work the mines in this district. From present indications, there will be no time during the winter when men will not work as well as in the summer. Some of the mines are now employing more men than ever. There need hereafter be no "waiting for spring." Mining is constantly done on the Champion and Buckeye with good results for the Eureka Consolidated Co. Their furnaces are running without intermission at the rate of about 40 tons per day, and they have continually increased the size of the dumps. The Jackson Co. are raising much more ore than can be smelted in the two furnaces. The Buttercup Co. furnaces are

running on ore of their Mountain Boy and the Wide West, of Loucks & Co. The Wilson, Robertson & Co. furnace has been started within two weeks, and was set to work as soon as completed. During the very coldest weather of December, work progressed, and the best results are being obtained from the Badger ore, which is furnished by four men as fast as needed to make three tons of bullion per day. The Ogden, Dunne & Co. furnace and separating works have been almost entirely built during the winter, and are now in full operation, making bullion and separating it, so that from the ore they turn out pure silver bars.

OGDEN, DUNNE & Co.—The smelting and separating works of this Co. are described at length in the *Sentinel*. The arrangements are pronounced perfect in every respect. The whole cost was \$40,000. In a few days another furnace will be commenced, which will be capable of reducing 25 to 30 tons daily.

PHOENIX.—This Co.'s mines, the Adams & Farren, the Deep, Empire and Lexington, are being rapidly worked. In 19 days a tunnel of 85 feet was run into the Adams & Farren, striking the ledge in very fine ore. The tunnel in the Deep has been run about the same distance in the same time, but will not be in ore for some days. The Adams & Farren is one of the most promising in the district, and the Co. could now sell the ore they have out for enough to cover all expenses.

MINERAL HILL.—A correspondent of the *Elko Independent*, Jan. 21st, says: A vast quantity of rich rock is lying at the Manhattan mill awaiting crushing. The mill is turning out over \$2,000 in bullion every day, and cannot begin to do the work needed. More mills are wanted immediately.

ROSLIN SMELTING WORKS.—These are producing very fine bullion in large quantities. They are making three tons per day.

HUMBOLDT.

CENTRAL DISTRICT.—*Silver State*, Jan. 21st:—This district now promises to be one of the first. The "Silver" ledge, owned by King and Jemison, prospects admirably. Pay rock was found at the surface, realising \$200 per ton. The Silver State ledge, owned by King, Jemison and Gilbert, has been uncovered 60 feet, and develops a regular vein, averaging two feet in width. They have made three shipments, and received, net, \$272 to the ton. The Monarch, owned by same parties, is three feet in width and gives from \$40 to \$300 per ton. The Railroad, owned by Frank and Cyrus Clark, shows itself to be a mammoth ledge of ten feet, with myriads of tons of good ore in sight. The Galena, located by Mrs. Frank Clark, is a fissure vein of six feet in width, uncovered 100 feet, and showing tons of good shipping ore. Numerous assays give over \$100 to the ton. The Mul-len has already acquired a reputation. From eleven tons of the rock the owner received \$1,718, or over \$160 to the ton, from San Francisco.

WASHOE.

SAVAGE.—*Enterprise*, 22d: From this mine 190 tons of ore are extracted per day. About 40 tons are from the sixth station, hoisted out through the Hale & Norcross shaft. Two winzes have been sunk in the ore body on the sixth level to the depth of 32 feet below the track floor, and it has been found that the ore does not extend below that point.

CROWN POINT.—This mine is looking well. On the 1,100-foot level they have raised on the new ore body 56 feet, where it is four or five feet in width, all in good ore. On the 1,100-foot level a drift is being run to cut the new body upon which they are now working upward. A new station is being opened at the 1,200-foot level. The old mine—old upper levels—is yielding about as usual.

CHOLLAR-POTOSI.—The affairs of this company move on swimmingly. During the past week 2,000 tons of ore have been extracted, 1,540 of which was sent to the mills—average assays \$70.20. The mine yielded during the past month, clear of all expenses, \$321,000, by far the largest clear yield ever made in one month by any mine on the Comstock lode.

OPHIR.—Work is vigorously prosecuted in the "up-rise" from the south drift to tap the ore body supposed to extend down from the old 9th level in the neighborhood of the Central mine.

VIRGINIA CONSOLIDATED.—Nothing was found in the west drift, and they are now concentrating their force upon the branch drift to the northwest, in the direction of the Central mine.

SIERRA NEVADA.—The Sierra Nevada and Sacramento and Meredith have been incorporated into one mine under the name of the Sierra Nevada. The old Sierra

Nevada is yielding as usual, and the mill is in constant operation; the Berry and Evans mill is also running upon ore from this mine. The Sacramento and Meredith mill is being put in order, and will start up about the 5th of next month.

BUCKEYE.—This mine in Devil's Gate District, is yielding a large amount of good ore. The Sherman mill is crushing ore from the mine and they have large amount in their dumps. They have leased the Franklin mill on Carson River, and it will start up in three or four days.

YELLOW JACKET.—The mine is yielding 170 tons per day principally from between the 900 and 1,000-foot levels. The drifts north at the 1,000 and 1,100-foot levels, are still driven under contract, but have encountered no ore as yet.

BELECHER.—About all that can be said at present is that at the bottom of the winze sunk upon the 335-foot level the ore appears to improve both in quantity and quality.

HALE AND NORCROSS.—They are opening out on the eight level where the orebreasts look well. The yield of the mine is 216 tons per day, 30 of which comes from the old mine.

IMPERIAL-EMPIRE.—To-morrow they will commence sinking for a new level. From the old Imperial they are taking out sixty tons of ore per day.

GOULD AND CURRY.—About the usual quantity and quality of ore extracted.

DANEY.—The drift from the bottom of the main shaft had yesterday penetrated toward the lead 36 feet. The rock continues quite hard.

SUTRO TUNNEL.—The Sutro Tunnel was yesterday in 1,790 feet. The ground was quite hard for a few days, but is now improving.

OVERMAN.—The affairs are in statu quo. Same amount of ore coming out as usual.

KENTUCK.—The only new thing is the \$10 assessment, aggregating \$20,000, lately levied.

WHITE PINE.

REVIEW.—*News*, Jan. 21st: The regular annual rush is this year to Salt Lake and Pioche. The few White Pines who join it can be spared. Most of the workmen know better than to leave what will be steady employment for all summer or longer. All agree that the prospects for a good season on Treasure Hill were never better. Outside districts, too, show increased activity.

ITEMS.—On the Ward Beecher, there are five working shafts which lead to four large chambers—the bottoms of which are all connected by one drift. In fact, this drift runs through the whole mine, connecting it with the North Aurora. The drift has now reached a length of 300 feet, in excellent ore all the way. The cross-cut from the Ward Beecher to the North Aurora is 94 feet long, and is being carried on further to the eastward in good ore. The four chambers in the Beecher are nearly filled up with ore, for which there is no room on the dumps, and which will be sent to the new mill as soon as the tramway is finished. About 30 tons of ore are sent daily to the Oasis mill from the Beecher. This yields an average of \$150 per ton. Eberhardt—Twelve men are working, six of whom are breaking down ore, of which there is 1,500 tons lying at the mine waiting for transportation. Four men are sinking a new working shaft, now down 43 feet. South Aurora—enough ore is taking out daily to keep the Stanford mill running. A force is clearing the ground for the new orehouse and tramway station. Pocotillo—has been sold during the week for \$25,000. Work will be started to-day. Posthole has plenty of low-grade ore in sight. Still sinking in their deep shaft, which has reached a depth of 130 feet. Summit—has shaft down 80 feet, with good indications at the bottom. Has plenty of low grade ore on top. Iceberg—is down 50 feet, and has taken out some first-class ore during the week. Bourbon—is worked under a lease. Three men are drifting to the eastward. The shaft is down 25 feet. The drift is being run on very fine ore. Genesee—is working in large tunnel with 16 men, and taking out fair ore. Noonday—continues sinking shaft, but nothing new developed. Sierra Pascoe—working five men, shaft down 30 feet, drifting on good ore. Hemlock—part of the mine is worked under a lease, and some splendid rock has been taken out. Some of it will go \$1,000 per ton. Silver Wedge—has recently struck a body of fine ore. Virginia—is only working three men. Still sending ore to the Smoky mill. Emerald Isle—has run a tunnel 140 feet in length and struck first class ore. They have not got through it yet, proving the deposit to be extensive. Original Hidden Treasure—contracts have been let to deepen the shaft and put the mine gener-

ally in proper shape. Six tons Mazeppa ore worked, the first quality \$232 per ton, the second \$90.

Idaho.

ITEMS.—*Avalanche*, Jan. 14th: A force of six men are at work in the Skookum mine. Mickey & Co. are working the Empire and getting out fine-looking ore. Hank Townsend & Co. are taking ore from the Morning Star above the water level. They own one-third of the mine. During 1870 the Golden Chariot paid dividends to the amount of \$75,000. Two mills, the Ida Elmore and Owyhee, are constantly running on Chariot ore. The Fairview quartz mill is now running on ore from the old slopes of the Chariot. The mill works in the most satisfactory manner.

Montana.

BEARTOWN.—*Deer Lodge Independent*, Jan. 14th: We learn that there are as many claims worked in Bear Gulch this winter as last, and the yield promises to be equal to that of 1869-70. It seems that ground not supposed to contain gold is paying well, and bids fair to do so for at least two years.

MINERS' DITCH.—This is nearly completed, only 15 men being now employed on it. Col. Thornton has a force building a large reservoir at the head of Race Track ditch. A large number of men are prospecting in the gulches, hills and bars from Race Track to Lost Creek.

WEATHER.—*New North West*, Jan. 13th: With the snow fall we have had in the past few days, and an average yet to come, there is general confidence that '71 will be a favorable mining year.

CABLE CITY.—*Helena Gazette*, 16th: Messrs. Con Kohrs, Valiton & Hayes have commenced the digging of a seven mile ditch, with a capacity of 400 inches. They will have it completed by the first of May.

INDIAN CREEK.—*Montanian*, Jan. 12th: The Pittsburg mill is finished, and was started up; they found it impossible during the cold weather to run. There are several hundred tons of rock on the dump, and work is vigorously prosecuted on the lode. Keating & Blacker, at Radersburg, are cleaning up large amounts of amalgam each week. Since the improvements on their mill it works splendidly. The lode is looking better every day. The Sample mill has been closed for repairs. The Iron-Clad lode has proven itself one of the first in the Territory. Nave & Co. are running their mill regularly.

SILVER STAR.—Porter, Wiant & Lehmer on the Clipper lode, are meeting with most encouraging results. Mr. Porter brought up for shipment 113½ ounces of retort, extracted from twenty tons of ore, by arrastra. They have 100 tons at the shaft that will yield five to six ounces per ton, worth \$15 per ounce.

CARSON CREEK.—The Georgetown correspondent of the *Helena Herald*, Jan. 19th, says: The camp is at a stand still, most of the ground below the wet ditch being worked out. There is plenty of good ground above, waiting for a season that will supply the ditch with water. The recent rain and thaw raised the water so as to put back for six weeks, work on the great drain race which is to redeem the camp. The drain is 2,500 feet long, with a face of 15 or 16. The boys are sanguine of realizing their stake here.

New Mexico.

RALEIGH.—The Las Cruces cor. of the Santa Fé Post says returns have been received from ore sent to Newark, N. J. and New York, showing yields, the lowest of which was eighty-six dollars, and the average two thousand two hundred and eighty-two dollars per ton.

The Artesian Well Co. are sinking wells at the new placers twenty-five miles below Santa Fe, and have struck water at the depth of eighty feet.

Utah.

SILVEROPOLIS ORE.—*Salt Lake Herald*, Jan. 18th: Walker Bros. have placed at our disposal the following statement of returns from four ear loads of Silveropolis ore. One ear load shipped to Reno, and the bars sent to New York, realized in currency, net, \$6,909.36. One shipped to San Francisco, and sold there, netted \$5,935.30 in currency. One shipped to Reno, and the bars sent to New York, \$7,724.74. One sent to San Francisco netting \$2,950. This is a total of \$23,522.40 for the four ear loads; the cost of working the ores being \$4,289.26; leaving a net profit of \$19,233.14 on 40 tons of ore.

EMMA.—A Salt Lake cor. of the *White Pine News*, of Jan. 20th, says: It is rumored on the street to-day that the Emma mine has been sold to W. M. Lent, of San Francisco, for fourteen hundred thousand dollars.

Mining Stocks.

SAN FRANCISCO, Thursday Eve., Jan. 26.

The line of the market has been quite fair on the whole, although weak at times and with some variations. Quite a noticeable fact was that all the leading descriptions (17 in number) closed exactly the same on this and on yesterday morning. The annual meeting of the Metropolitan Mill and Mining Company was held on the 23rd, when the following Trustees were elected: Alpheus Bull (President), G. W. Clark, J. Hahn, J. C. Collins and T. A. Olivan—Secretary, J. T. Milliken. The Secretary's report shows that the receipts for the year 1870 were \$103,951; total expenditures, \$106,259, including \$2,830 for reduction in value of materials and supplies on hand at commencement of year, and also including \$7,257 for cost of ore now on hand but paid for in 1870, but exclusive of \$10,000 paid in dividends. The quantity of ore worked was 6,984 tons. The average yield to the Company of the ore worked, including all ores purchased, mined and worked for customers, was \$14.88. The average cost for working the same, including all expenses at the mill and at San Francisco, was \$14.17 per ton.

The following table gives last Thursday's quotations and the highest and lowest points since reached by the several descriptions of stock.

	Jan. 10.	Highest.	Lowest.

The mining share market opened weak, on last Friday, but on Saturday there was a reaction, and very considerable excitement on account of the rapid advance of Crown Point, which sold heavily up to \$40. This week, the market was at first quite firm, but grew weak again on Wednesday, through a collapse in Belcher and Crown Point. The following table gives last Thursday's quotations and the highest and lowest points since reached by the several descriptions of stock.

THE SCIENTIFIC PRESS.—An illustrated journal of Scientific and Industrial Progress. Devoted to Mining and Mechanic Arts. San Francisco: Dewey & Co., Publishers.

We are in regular receipt of this handsome and valuable weekly, and always receive it with pleasure. It is able edited in all its departments, and is well worth the liberal patronage it is evidently receiving. It embraces a large range of subjects, and being profusely illustrated, may be regarded as a model paper of its class. Terms, \$4 a year.—*Jour. of the Farm.*

THE SCIENTIFIC PRESS deserves the support of all Californians, for there is nothing that transpires in connection with Mining, Farming or Mechanics, interesting and valuable to the people of this coast but finds a place in its columns. As the scientific articles are all illustrated, the readers the more readily understand the various subjects which are therein treated. A subscription of \$4 per annum, will ensure it by mail weekly; address DEWEY & CO., San Francisco.—*Val. Chron.*

A. B. BOWEN, of this paper is making a short trip in the vicinity of Sonoma, and will be glad to receive subscriptions and receipt for dues, to either the SCIENTIFIC or RURAL PRESS.

INDUSTRIAL MISCELLANY.

Colonization Movements.

The idea of a rapid settling up of the large territorial area bordering upon and within the great Rocky Mountain range, by a system of colonization, is being quite actively discussed by writers and political economists on both sides of the Atlantic. The wonderful success which has attended the "Greeley Colony," where a large town, with substantial blocks of buildings, beautiful avenues, ornamented with trees, and fountains, public edifices, etc., has grown up, as by magic, in a single season, is operating as a wonderful stimulus in this direction.

The "lust for gold" which, for the last 20 years, has been the stimulating medium for attracting settlers to the Rocky Mountain and Pacific Slopes, enters but very little, if at all, into this new movement. The aim is to build up permanent settlements upon an agricultural and manufacturing basis. Farmers, who more than any other class of population, form the bone and sinew of a country, are ever slow to change the advantages of convenient markets, schools, churches and home surroundings, which they enjoy in old settled localities, for a pioneer life in the midst of desert wastes, however beautiful and productive those wastes may be made by the hand of industry.

But the success of the Greeley Colony has shown them that they can carry all these home advantages with them; if they will only go in large bodies, and settle upon contiguous lands. They can carry their markets with them, by taking along a due proportion of mechanics, who will establish home manufactures for the chief necessities of a mixed community. Willing and earnest hands can soon hew out the materials for dwellings, churches and school houses; and a town may be built up in a few months which shall have all the essential elements of comfort and success which surround the most flourishing of pioneer towns anywhere. The city of a year which has thus grown up on the Cache la Poudre is a living proof of what we write.

And there are hundreds, indeed we may say thousands of localities, equally eligible within the broad domain extending westward from Kansas, northward to British America, and southward to Mexico—a territory embracing an area more than half as large as Europe, and capable of sustaining a population twice as great as the present total of the entire Union.

The overcrowded centers of Europe are just beginning to realize the opportunities here presented; and, through the agency of properly organized colonization agencies, we may soon expect to witness an influx of population from that quarter, far in excess of anything yet witnessed in the annals of emigration. California should be up and doing in view of this great movement of labor and capital, and so direct a portion of the stream, that the Western Slope of the Sierras shall receive at least a moiety of the benefits so intimately connected with the public weal, and so fraught with material benefit to the people, individually and at large.

CALIFORNIA FRUITS IN WASHINGTON.—We clip the following from the Washington correspondence of the *Sacramento Union*:—Senator Casserly has received, in good condition, olives and oranges on the branch, and fresh figs and almonds from California. Bidwell, the son-in-law of Superintendent Kennedy, also supplied his family with luxuries from California. These arrivals of good things established a cordial relation on Christmas between the Pacific coast and the East and made us feel at the seat of government that our future confectioneries will be derived from the American Paris on the slopes of the Pacific.

Hughes' Patent Lantern.

Had Diogenes been provided with the lantern here illustrated he might possibly have had less difficulty in his search after a wise man; for, in justice to those ancient times, we may be allowed to hope that the chief trouble in the discovery of such a man arose not from the great scarcity of the article, but rather from the want of sufficient length in the part of the searches.

Mr. Hughes could have presented Mr. Diogenes with a good light-producer. We should like to have seen him recommending it to the old philosopher, as "strong, durable, easily kept in perfect order, and much better than that thing in your hand or any other now in use. Will be great economy for you to purchase, for it not only will outwear a dozen of the kind you

Fig 1

HUGHES' PATENT LANTERN.

now have, but will give so strong a light that you'll find ten large men of the sort you're after in less time than it now takes to find one small one.

"You see how the wire frame carries and protects the glass, so that it can't be bro-

ken. This wire frame is hinged to the base, in this way (Fig 4). Now we can easily take out the glass, clean it, and then replace it by reversing the movement of the frame until it rests upright on the base, and is held by the spring on the side of the base opposite the hinge, this spring being so arranged with a pawl, so that it cannot retract by accident.

"The two eyes provided, one on each side of the cylindrical top of the lantern, to receive the hooked ends of the bail, are strengthened by the addition of a strip of metal (Figs. 2 and 3), so that they can't be torn open. The strip is inserted through slits and its ends overlap; and the hole is then drilled through the whole four thickness, so that the durability is very great.

"The whole affair is solidly built, and every precaution has been taken to make it a splendid thing. You can't find another in which the glass can be so easily removed and cleaned, where the upper part is so securely retained on the lower part, the affixing of the bail is so durable and efficient, the—

and weave it in hand looms, into vest patterns, etc., but have no experience in preparing it for market."

VEGETABLE PRECOCITY.—A gentleman who called at this office, a few days since, to place upon our subscription books the name of a friend, informed us that he planted in a flower pot, early last spring, an orange seed which in due time sprouted and came up. During the summer, he took the young tree, still in the pot, to the ranch of a friend in Sonoma, where it has recently put forth a well developed blossom—in less than one year from the seed!

DRIED FRUIT.—Mr. Victor Portroon, of the Esperanza Ranch, says the *Calaveras Chronicle*, has shipped to San Francisco, this fall, 1,500 pounds of dried figs of a superior quality, which brought from 15 to 18 cents per pound. Also two tons of dried plums, which sold readily for 20 cents—all raised by himself. This result shows what a little energy may do, in utilizing the surplus products of our orchards and small fruit nurseries.

"What, you can't afford it. Well, take this one on tick, and when you're in funds send me on the money. Recommend the lantern to your friends and, at the earliest moment, address your letter to John Hughes, Box 90, Buchanan Post Office, Pa."

OPIMUM CULTURE.—The *San José Independent* copies our articles on Opium Culture, and calls the special attention of its readers to the value thereof, as one of the many new crops to which our farmers should resort in their endeavors to introduce greater variety into the products of their fields.

SILK CULTURE AND HOME MANUFACTURE IN NORTH CAROLINA.—A New York gentleman who proposes to go into the silk business extensively in Buncombe County, N. C., writes us for some special information

Fig 2

Fig 3

Fig 4

California Agricultural Notes.

SHADE TREES.—The Santa Clara Agricultural Society advertises for sealed proposals for furnishing 400 trees for its fair grounds—100 each of locust, Monterey cypress, South Carolina poplars and Australian blue gums.

BLOODED STOCK.—The *Solano Republican* of Jan. 19th says: Five head of Durham cows came up on the Amelia on Tuesday night. They belong to Lewis Peirce, and were recently imported from England.

SALINAS VALLEY is about eighty miles long, with an average of seven miles in width. The *Standard* estimates the area of agricultural land to be 550,000 acres. Some of it is very rich and wonderfully productive—140 bushels of barley having been produced to the acre in some places. The greater portion of the valley is owned in large grants, but the proprietors are beginning to sell off portions, as the best way to enhance the value of the balance. Probably one-fourth of that valley is under cultivation.

BARLEY IN CHICO.—Farmers near Chico are holding on to their barley, while the merchants of that place are receiving fifty or sixty tons daily from other points.

STRAWBERRIES IN JANUARY.—Fine ripe strawberries are selling in Los Angeles market at 50 cents per pound.

CATTLE AND SHEEP.—It is said that cattle stand the dry season and short feed much better than sheep; that while but very few cattle have died, the sheep suffer and perish in large numbers.

QUAILS IN IDAHO.—The Quail Association of Boise City, Idaho, are importing large quantities of these birds from Missouri and California, and turning them loose in the hills and valleys of that section.

OLIVE TREES IN PLACER COUNTY.—C. E. Carpenter is commencing to plant olive trees at Rattlesnake Bar—probably the first in the county. It is claimed that the climate and soil there is very favorable for the olive. The speculation will undoubtedly be highly remunerative.

FEEDING SHEEP.—The *Marysville Standard* gives the situation of sheep in that vicinity as follows: Sheep herders are compelled to feed their flocks considerable quantities of hay, which, at \$20 per ton, is expensive. We have heard it stated that the loss from cold and lack of usual grazing will amount to 20 per cent., or equal the natural increase for the season.

Eastern Agricultural Notes.

UTILIZING VINE PRUNINGS.—Some of our Eastern grape-growers are utilizing the new wood prunings of the vine for wine and vinegar manufacture. After being cut small they are bruised and put into a vat or mashing tub, and boiling water poured on them, in the same way as done with malt. One of the experimenters says that they produce liquor of a fine vinous quality, which on being fermented, makes a very fine beverage, either mild or strong, as you please, and on being distilled, produces an excellent spirit of the nature of brandy. In the course of his experiments he found that the fermented liquor from the pruning, particularly the tendrils, when allowed to pass the vinous acid to run into the acetous fermentation makes uncommonly fine vinegar.

A **LOWELL** man has built a heavy large enough to accommodate 3,000 hens.

The refuse potato pomace from starch factories is now to be made into paper.

ILLINOIS and **IOWA** stand at the head of the wheat-growing States.

A **PROFITABLE ORCHARD.**—The Mendenhall orchard, of 66 acres, in Richland County, Ill., returned as the net proceeds of its last year's crop \$8,312.

THE CATTLE SUPPLY.—Of the 355,277 beef cattle sent into the New York market last year, the State of Illinois furnished 204,131. Texas comes next in the list, being credited with 40,557.

ORDERS FOR BEET SUGAR.—We see it stated that orders for large amounts of beet sugar have been sent to the agent of the Alvarado Company in this city, from Oregon, Nevada, Idaho and other distant localities on this coast. Thus it appears that this new industry will be encouraged by the people, however much merchants and manufacturers may feel inclined to dispose of the foreign grown instead of the home grown as well as home made articles.

POPULAR LECTURES.

Vaporization and the Elastic Force of Steam.

[Prof. JOHN LECONTE before the MECHANIC ARTS COLLEGE, Mechanics' Institute Hall, S. F. Reported expressly for the Press.]

LECT. II., Jan. 21. In the last lecture, said the professor, I stated that air was not the agent of evaporation, and that these two theories founded on the ideas that air was a solvent and that it was an absorbent of vapor, were erroneous. I showed, moreover, that in vacuum evaporation takes place instantaneously; that the vapor has a certain elastic force which we measure by the distance through which it depresses the mercury in our tube; and that an increase of temperature causes an increase of this force, although not in the same ratio. These points should be kept in mind to understand fully what is to be said this evening.

Now there is a certain density or elastic force beyond which a vapor cannot pass. In a given space, only a certain amount of vapor can be formed, this amount, it may be said, being dependent on the temperature. If we decrease this space, the temperature

remaining the same, part of the vapor is condensed back to liquid. We can show this by a simple experiment.

We have here a tripod (see Fig. I.) which holds a tube, A, which has a cup-shaped top and which is filled with mercury. This is a conveniently-formed mercury bath. Now we take a glass tube, just as in our former experiments, filled partly with mercury, close the end with the finger, invert and dip in the quicksilver bath as before. A certain amount of air is now in our tube, B, the mercury column sinking until its weight is equal to the pressure of the air on the bath. Now, if we sink our tube down in the mercury, the space above the column in the tube, *a b*, always remains the same. Thus, (see Fig. II.) the space, *a b*, in the position A, is just as large as the space, *a b*, in the position B, while the height of the mercury column has changed (*b c* and *b' c'*).

But now we take another glass tube, also partly filled with mercury, and add ether until it is quite full. Inverting as before and placing in our bath, the ether rises to the top, vaporizes, and fills the space, *a b*, Fig. III. A. Now, however, if we sink the tube, this space does not remain the same, but grows smaller, the lower down we press the tube, while the vapor condenses to liquid ether, until, pressing the tube way down, we have only liquid above as shown at B, Fig. III. The height of the mercury column has remained the same, however, in both cases, (*b c* and *b' c'*) showing that the pressure or elastic force has remained the same.

By the compression, then, of vapors, one comes to a limit beyond which their elastic force cannot increase, where any further

compression only results in a condensation. Vapors at this limit are said to have their maximum of elastic force, or maximum density. This gives us a characteristic and important difference between vapors and permanent gases. The air, in the experiment, was a permanent gas, while the ether gave out vapor. Our experiment likewise showed that the density, or elastic force of vapors remains the same, at the same temperature: for (Fig. III) the height of the mercury column (*b c* and *b' c'*) remained unchanged at all portions of our tube.

Vapors which have reached their maximum density are said to be saturated. The maximum density is increased by an increase of temperature.

Laws of Vapors in Vacuum.

From our experiments and others of a similar nature, we can deduce four laws:

1. Any liquid in a vacuum gives out vapor which instantly takes its maximum density.
2. The maximum density is not augmented by pressure nor decreased by rarefaction. Compression results only in liquefaction, but the elastic force is unchanged. By raising our tube the liquid vaporizes again, but we cannot get the mercury to rise any higher. If, however, we should separate from the fluid a space filled with its saturated vapor, and then increase this space, the vapor would still fill it completely; but it would then be no longer saturated, no longer have its maximum density, and would act under compression just like a permanent gas, until the point of saturation, maximum density, were again reached.
3. This maximum density varies with each liquid.
4. It depends on the temperature, increasing as this increases, but much more rapidly.

These laws give us two methods of reducing vapors to liquids:—by pressure and by cooling. Of 22 vapors which have been experimented on, 16 have been liquefied and 10 have been frozen by these methods.

Condensation by Cooling—Rain in Hot and Cold Countries.

The amount of vapor condensed by cooling depends not only on the number of degrees the temperature is reduced, but also on what part of the scale, whether high up or low down, this is done. For example, we find from our tables of figures (which the lecturer showed) that if we reduce the temperature from 90 degrees to 50 degrees, Fah., 10.721 grains of vapor of water are condensed; while if we reduce it an equal amount, but from 70 to 30 degrees, only 6.023 grains are condensed.

This fact explains why it is that a fall in temperature is accompanied by more rain in tropical than in colder countries. The higher the degree at which the reduction is made, the more vapor is condensed.

Modifications of Evaporation.

Dalton propounded two laws which, although not exactly correct in all the details, yet contain the germs of truth. These are as follows:

1. The elastic force and the amount of vapor formed in a given space at a given temperature are the same whether the space is filled with air or other gas, or vapor, or is a vacuum.
2. Each vapor rising in a given space adds its elastic force to that of any vapor or vapors already there, and to just as great an extent as if it were a vacuum.

If we had water under this inverted tumbler, its vapor would in time fill the enclosed space above the water, attaining its maximum density. If we then added alcohol, this also would evaporate, till the vapor attained its maximum density, and then stop. So we might then add ether, with the same result, and so on. If the space now were a vacuum, the vapor would attain its maximum density instantly, but if air or other vapor is present, it takes a longer time. The evaporation of one liquid doesn't interfere with that of another in amount, but only in the rapidity of action.

For example, if a space were filled with aqueous vapor, at 50 degs. of temperature, the elastic force would be equal to 0.36 in. of mercury; if we had alcohol, its vapor would have an elastic force of 0.95 in.; if sulphuric acid, it would be 7.85 in.; if ether, 11.28 in. If there were added, one after another, the total elastic force exercised would be the sum of these, viz:—0.36 + 0.95 + 7.85 + 11.28 = 20.44 in. of mercury.

Regnault has investigated these matters thoroughly, and finds that Dalton is right, if the different vapors exercise no chemical action on one another. But if they do exercise such action, the resultant elastic force is not the sum of the individual elastic forces, but is modified.

Atmospheric Vapor—Rate of Evaporation.

All the aqueous phenomena of the atmosphere,—rain, clouds, fog, frost, snow, etc.—depend on the aqueous vapor which is mingled with the air. Now if we had no atmosphere, what would be the result? The vapors would flash up instantly, attaining their maximum density, and then all evaporation would cease. But, as we have seen, air retards evaporation; and its movement, the air carrying off the vapor mixed with it, gives chance for more evaporation.

If the ocean were universal, covered all the globe, we would not have more rain, but probably less; for the land acts as a condensing apparatus, and thus causes the vapor to be constantly removed from the surface of the water, enabling more to form. If water were universal we should probably have only a gentle distillation, and constant fog in the polar regions.

The causes which influence the rate of evaporation may be reduced ultimately to five:

1. The extent of surface of the liquid. The rate is proportional to this.
2. The temperature of the liquid.
3. The elastic force of the vapor at the surface of the liquid. If such vapor is at its maximum density, no further evaporation can take place.
4. The wind, which removes the vapor present.

5. The pressure on the surface of the liquid. The rate is inversely proportional to this.

The following tables illustrate these. The first gives the rate of evaporation per minute, according to Dalton's experiments, with a circular surface of water, 6 inches in diameter, at different temperatures and with a calm, a breeze and a high wind.

Temp. Fah.	Elastic force, Inches Merc.	Calm grains	Breeze grains	High Wind grains
212°	30.000	120.00	154.00	188.00
85	1.255	4.92	6.49	8.04
75	0.595	2.65	3.48	4.32
65	0.657	2.62	3.37	4.12
55	0.476	1.80	2.43	2.95
45	0.340	1.36	1.75	2.13

Daniel's experiments with a circular surface, 2.7 inches in diameter, at 45° temp., during one-half hour, gave these results:

Pressure.	Evaporation.
30.4 inches mercury	1.24 grains
15.2 " "	2.57 " "
7.6 " "	5.68 " "
3.8 " "	9.12 " "

The rate of evaporation depends on all these points; and many mistakes have been made in trying to explain phenomena by one alone. Thus the fact that more rain falls in the northern than in the southern hemisphere, while there is more water in the southern than in the northern, has forced those who have supposed evaporation to depend only on the extent of surface, to get up many a wild theory, about the vapor being generated in one hemisphere and then carried far away and deposited in the other. But vapor doesn't wander many hundred miles from the place where it is generated.

Dew-Point—Humidity of Air.

If the vapor is not at its maximum density, it acts like air or other permanent gas, as stated above. If the aqueous vapor in the atmosphere were at its maximum density, a reduction of temperature would always condense it. But owing to the mechanical impediment of air, it is not generally in this condition. Now the temperature at which the condensation of the vapor begins, that is, the temperature at which the amount of vapor in the atmosphere is sufficient to saturate the air, is called the dew-point. [For instance, suppose every cubic centimeter of air held 13.63 grammes of water vapor, while the temperature is 20

degrees Celsius. The air is not saturated with this amount at this temperature, but it is saturated at 16 degrees. Therefore, 16 deg. would be the dew-point for this case.]

When we speak of the humidity of the air, we do not mean to give the actual amount of vapor in the air, but the proportion of this amount, and the amount which it can contain at the given temperature, or the nearness of the actual temperature to the dew-point. [Thus the air is "dry" when it is far from its saturation-point or dew-point, but "moist" when it is near to this. Thus, in a hot day, (as the higher the temperature, the more vapor there can exist), the air can contain much vapor, and yet be "dry," while, on a cold day, it can be "moist," although containing only a fraction of this amount.] Humidity is then the ratio of the elastic force at the dew-point to that at the given temperature. We reckon it according to the formula: Humidity = $100 + \frac{e - E}{E}$ where we multiply by 100 to get the result in per cent., and where *e* = elastic force at the dew point, and *E*, the elastic force at the given temperature. For instance, suppose our dew-point to be 50 degrees, and our actual temperature to be 70 degrees, Fah. As the elastic force at 50 deg. is 0.361 (in. mercury), and the elastic force at 70 degrees is 0.733, (these numbers have been found by experiment), the humidity is 49.2 per cent. For, according to the formula.

$$\text{Humidity} = 100 \times \frac{e}{E} = 100 \times \frac{0.361}{0.733} = 49.2$$

As the elastic force increases more rapidly than the temperature, if we mix vapors, which acquire their maximum density at different temperatures, we get a precipitation. We can reckon this amount of precipitation. Thus, we mix a cubic foot of vapor of maximum density at 90°, with a cubic foot of vapor of maximum density at 60°. We have then 2 cubic feet at the mean temperature of 70°. Our tables show the first to weigh 14,810 grs.; the second, 4,089 grs. The two then weigh 14,810 + 4,089 = 18,899 grs.; or one foot weighs one-half of this, or 9,449 grs. But at the temperature of 70°, the maximum density can be only 7.992 grs.; therefore 9,449 - 7.992 or 1.457 grs. are condensed.

Rain Theories.

Hutton evolved two theories of rain from these principles. When the air bearing vapors comes into hot regions, it is heated, carried up into the higher regions of convection, and the vapors condense and are precipitated in heavy showers of rain. 2. When a mixture of warm air and warm vapor with cold air and little vapor occurs, we have gentle rains. The first occurs in tropical regions; the second in the temperate zones.

In certain places in the tropical region, particularly in the forest of Brazil, for instance, the rains occur at regular times even to the hour. Thus, the nights and mornings are clear, but at noon and during the afternoon it rains. This may be thus explained. At the rainy season the sun is nearly vertical in such places. By noon it has heeded the land so that the winds bearing the vapors are carried directly up to the colder regions of space and the vapors are condensed and fall as heavy rain. By night the heat has decreased, and the winds regain their horizontal direction, carrying away the vapor during the night and morning, (which are therefore clear) until the next noon, when the same phenomenon occurs as before. This takes place for, say 90 days, when the position of the sun has so changed that the necessary conditions are not presented, and the dry season occurs.

The lecturer proceeded in his application of the matter to England and India, giving data, and examples. He then came to the case of San Francisco. Here, as the ocean is not warm, while the land is, we have no rains, except when the wind is from the south, when the vapors brought by it are warmer than the land and condensation, or rain, follows. The next lecture will be on Boiling, and the Spheroidal State will be particularly considered.

THE CANAL BILL.—We have information from a reliable source, that the bill about to be presented to Congress asking for a land subsidy to aid in the construction of a canal through this country, will be so guarded as to reserve all mineral lands to the Government, and protect actual settlers to rights already acquired, and all other rights acquired by any one prior to the passage of the Act. It will also provide for the sale of water here and elsewhere along the line of the canal, wherever a demand may be made, to the extent of its capacity. It will also limit the price of water per inch per day, at the usual measurement to miners.—*Placerville Democrat*.

San Francisco, Thursday, Jan. 26, 1871.—Legal Tenders buying @91; selling @91½. Gold in New York to-day 110½.

Table of Contents.

Hesse Grinder and Amalgamator, Ill.; Automatic Stop Governor, Ill.....	Page 49
MECHANICAL PROGRESS.—Boring Machines at Mont Ceniz; Locomotives for Canada; Wood-Saving Machine; Fret Machines; Gas Purification, Connecticut Manufactures; American Russia Iron; Rubber Tires; Mail Lock.....	50
SCIENTIFIC PROGRESS.—Glacier Motion; Fusing Platinum with the Blowpipe; Alcohols; Geography of the Sea Bed; Glaciers; Geol. Survey of Cal.....	50
Bound East; Notes of Travel in San-Joaquin County.....	51
MINING SUMMARY; Mining Share Market; Stockholders' Directory.....	52-53
INDUSTRIAL MISCELLANY.—Colonization Movements; Hughes' Patent Lantern, Ill.; Opium Culture; Silk Culture; California and Eastern Agricultural Notes, etc.	
Vaporization and Elastic Force of Steam, Ill.....	55
State University; Railroad Matters; Killed by One's Friends.....	56
Full List of Patents; Notices of Recent Patents; Smelting Furnace, Ill; Thompson Road Steamer.....	57
HOUSEHOLD READING.—Health; Cooking Meat; Vegetables; Food Medicines; Domestic Receipts; Mechanical Hints; Life Thoughts; etc.....	58
Things and Events at White Pine; Brown's Piston Packing, Ill.....	70

THE STATE UNIVERSITY.

The Board of Regents met on Monday, principally to settle indebtedness incurred lately. Bills, amounting to \$4,616.34, were ordered paid, and others, amounting to \$13,185.61, were ordered paid when approved by the proper committees. The Board adopted a resolution offering, in effect, to pay \$20,000 cash for the Brayton Estate instead of \$22,000 in interest-bearing bonds payable in 10 years. Resolutions were also adopted, giving Mr. George Tait the title of Assistant Professor of Ancient Languages, empowering this gentleman to employ such assistants as have been authorized by the Board for the Fifth Class, during the present term; also providing for permanent instructors in this class.

The construction of the University building is to be stopped, as this has cost more than was estimated. A compromise was effected with the contractor who was to furnish the bricks, and from to-day on all work is to be suspended.

We are to wait, then, an indefinite period of time, before we can have our University building, of which so much has been said. The action of the Board is probably the right one in the present case, but this result does but little justice to the financial ability of the Regents, some of whom are noted as the sharpest business men on the coast. We are informed that \$250,000 has been expended on the University during the past year, yet we have but a poor showing at the present time. We once thought that we had a University amply endowed and provided for in every respect, one which should make the name of California noted throughout the educational world. Yet here we are with a few students and a large deficiency of funds in the treasury. Shall we wait for the millennium for our University to acquire a respectable standing, or shall we be obliged to have another grand lottery?

THE DEER LODGE *Independent* comes to us enlarged and in a very neat dress, which is a marked improvement. Its typographical execution is very good, and the paper is a credit to its publishers and editors.

Railroad Matters.

[Continued from page 40.]

Narrow Gauge.

The subject of narrow-gauge roads is getting to a point where we shall soon have actual working tests, according to appearances. The California and Arizona R. R. Co. intend adopting this narrow gauge, as before remarked, and the Nevada and Grass Valley R. R. Association have been talking and figuring on the matter. The Grass Valley Union has given estimates, based on the nature of construction where a 4 ft. 8½ in. gauge would cost \$24,000 to \$30,000. It may be of interest to re-print these estimates of the Union, for although no definite figures can be given before the nature of the route is known, yet everybody desires to know "somewhere about how much" it will cost. The estimate is per mile.

For 30 lb rail, 53 tons @ \$90.....	\$4,770
Spikes and Fish-Plate, 6 tons @ \$120.....	720
Freight on above 59 tons @ \$15.....	885
2,600 ties, 6x8x5, 39 M feet @ \$20.....	780
Grading and Laying Track (say).....	2,500
Station and Platforms (say).....	50
	\$9,705

The grading may cost more or less per mile, according to the nature of the country over which the road will run.

The difficulty of making general estimates will be seen from the above, where, for instance, is included an item of freight on the iron, which amounts to about 9 per cent. of the whole. In any given case, there will be plenty of such additional items.

This Nevada and Grass Valley R. R. Association sprang from the old Nev. G. V. and Colfax R. R. Co., which was disbanded, and reorganized as the first-named association on the 14th ult. There have been four routes proposed for their road: to Colfax, to Marysville, to Wheatland (connecting with the California and Oregon road) and to Lincoln (same connection). The Marysville route is now the most probable, as not only do the Marysville people seem disposed to give aid, but a conference has been held with a committee of the Colusa, Marysville & Nevada R. R. Co., and a survey of this route is to be undertaken. The last-named company has \$114,000 already subscribed to its stock, and seems inclined to give valuable assistance. The conference meeting was held on the 9th inst.

Nevada.

Narrow-gauge has stirred up our Nevada friends again. On the 5th inst., articles of association of the Nevada Central R. R. Co. were filed. The company proposes to build a road "from a point on the Humboldt river, either at Gravelly Ford or Belowwee station (on the C. P.), Lander county, through the counties of Lander, Nye and White Pine, to Hamilton;" or, as stated by the Treasurer, from Palisade to Hamilton via Mineral Hill, Grass Valley and Eureka, on the 1 ft. 11½ in. gauge. Capital stock, \$5,000,000 (the estimated cost of building and stocking the road), of which \$150,000 have already been subscribed, and 10 per cent of this amount actually paid in. Then the Elko and Hamilton route is said to be earnestly taken in hand by interested parties, who form the Eastern Nevada R. R. Co., incorporated Jan. 20th. Other routes are mentioned, but these are now the prominent ones. It appears that the Nevada law, of 1866, provides that all railroads built by companies incorporated under the laws of the State, "shall be constructed with tracks of the uniform width or gauge of four feet eight and one-half inches, with the best quality of iron rail, known as "T" rail and "H" rail, or other patterns of equal utility, etc. A bill has been introduced into the legislature to repeal this section, which, according to our ideas, should be abolished. The people of Nevada seem alive to their interests, and to be going to work in a business-like manner to improve their facilities of transportation,—a matter of the greatest importance to them.

Montana.

Montana is also for building roads. The Northern Pacific has already been alluded to. The Cheyenne, Big Horn and Helena propose to build from Cheyenne to Helena. On the 15th of December a company was organized in Virginia City, its purpose being the construction of a railroad from Corinne, Ogden or Carter (the ultimate location of the southern terminus to be determined by the amount of stock taken at

the different points named) to the Gallatin valley, the route being through one of the passes at the head of the Madison river and thence down that stream to the Three Forks of the Missouri, where it is to connect with the N. P. R. R. and the Cheyenne and Helena line. The Helena *Gazette*, of Jan. 2d, says: The action of the people of Helena and Virginia City have aroused the people of Bozeman to action, and they propose to hold a railroad meeting next Saturday. This speaks well for their enterprise, having to go it alone without a local newspaper to advocate their interests. The proposed road is named the "Bozeman & Fort Fetterman R. R."

Utah.

From Utah, we have the following information, dated Salt Lake, Jan. 18th: A company was incorporated yesterday to run a railroad from the terminus of the Utah Central Railroad, of this city, south to Payson, a distance of sixty-five miles. The following officers were elected: William Jennings, President; John Sharp, Vice President, S. J. Jonasson, Secretary; J. T. Little, Treasurer; F. Little, Superintendent of Construction; Chief Engineer, John Fox; Directors—Joseph A. Young, William Jennings, F. Little, J. Sharp and D. H. Wells. Mr. Fox will immediately proceed to locate the line, and will commence work as soon as the season opens so that grading can be done. The intention is to build a branch line to the mouths of Cottonwood and Brigham Cañons.

The chances are said to be favorable for Congressional aid to the Salt Lake & Colorado R. R. Co., which proposes to build a railroad from Salt Lake City, by Utah Lake, the Severn and Rio Virgin rivers, to the head of navigation on the Colorado river, and thence to the most available point at or near the head of the Gulf of California. "The road," says the *Bulletin*, "would run for about 200 miles south of Salt Lake City, through a valley sparsely settled by Mormon colonies. Beyond there is nothing but a few military posts in the desert." The bill, which the Senate committee has agreed to report, according to published statements, makes the land grant ten sections to the mile for about 700 miles, an aggregate of 4,800,000 acres. It has several new restrictive clauses, one of which requires the sale, in quarter sections, to actual settlers.

Colorado.

Colorado has accomplished wonders in railroad matters. A year and a half ago there was not a mile of track laid within its limits. There are now 358 miles of road in operation, viz: Denver Pacific, Cheyenne to Denver, opened June 24, 1870, 106 miles (a few miles are, however, in Wyoming); Kansas Pacific to Denver, opened Aug. 16, 204 miles; Colorado Central, Denver to Golden, opened Sept. 38, 17 miles; Boulder Valley, Denver to Austin's coal hanks, opened Jan. 17, 1871, 31 miles.

Colorado does not stop here, but proposes doing as much more this year. Work is being pushed on the Colorado Central, up Clear Creek from Golden to Central, and this will probably be finished this year. The Boulder Valley is being pushed to Boulder City, and this, too, will be running next summer. It is said that it may be extended still further into the mountains via Boulder Creek, and perhaps even to Salt Lake City. A line is being located for the Golden City, Burlington and Pine Bluffs R. R., which will form a direct communication between the mountains and the Union Pacific. The Kansas Pacific will build from Carson to Fort Lyon, on the Arkansas, on their thorough Pacific line. Work is reported as commenced on the Denver and Rio Grande route, to El Paso, in New Mexico. The Central City *Register* says: It is proposed to build a narrow-gauge (2½ feet) road, and if the means are forthcoming, it will be completed from Denver to Colorado City by the 1st of next July. The route will be along Cherry Creek or one of the Plum Creeks, over the Divide and then down Monument, and will go through the counties of Arapahoe, Douglas and El Paso, until it reaches Colorado City.

The Colorado *Miner* publishes extracts from the prospectus of the "Rocky Mountain Railway of Colorado," which seems to propose building a narrow gauge system of trunks and branches, to tap all the principal mining districts from the new Swansea coal fields, at the base of the mountains, to Gray's peak, including Central, Georgetown, Cariboo, Grand Island, etc.

In 1869, we rode into Denver (from Cheyenne) in the stage-coach, and that last jolt, just before crossing the creek, made us devoutly wish for an easier method of conveyance. Now we find that Denver is the terminus of four roads, to Cheyenne, and thence to New York and San Francisco;

to Kansas City and the East; to Golden and the coal, and (soon to) the gold and silver mines; to Boulder and the coal mines on the road, and perhaps, by and by, to Salt Lake. The Denver and Rio Grande will make a fifth road terminating here. Verily, Denver seems to have a bright future near at hand.

It will be seen from our review, that the narrow gauge question has stirred up quite a railroad excitement, and that there is, moreover, a speedy chance of our having a narrow gauge road on our coast. There are one or two examples of such a road at the East, and several lines are reported as about to be built. In our State, the Nevada and Grass Valley, and the California and Arizona companies, will most probably test the matter at an early day; while other possible narrow gauge lines are talked of. In Nevada, the Eastern Nevada, and the Nevada Central will adopt it, if allowed by law. In Colorado the same is to be done by the Denver and Rio Grande, and the possible Rocky Mountain Railway. Our coast, apparently, is not behind the world in energy and readiness to adopt measures which promise well.

The energy displayed in pushing the Northern and Southern Pacific roads, give us fair prospects of better means of communication with the East, while the Union and Central roads are doing much to gain and secure the overland trade by making continual improvements. We have heard a visionary plan of a direct route from New York to Omaha, and rumors that the great Vauderhilt had secured the control of lines from New York to Omaha.

Killed by One's Friends.

If Messrs. Cole and Johnson, the one Senator and the other Representative of our State, and both supposed to be friends of the miner, are desirous of disgusting intelligent men with mining schemes in Congress, they could not have done better than in introducing the two bills which they have. The former has presented a bill providing that the United States shall pay three million of dollars to a company, "The U. S. Mining school and Metallurgical Co.,"—for founding and carrying on a free school,—to accommodate 300 students, with metallurgical works in connection therewith; the latter has presented another bill the principal object of which seems to be to lend money, not exceeding \$250,000 in each case to mining companies.

These measures evidently could be made to give rise to so much dishonesty, that we do not suppose that they will live through the sessions of the committee on mines and mining to which they were referred. Nor does their presentation imply that they are favored by the gentlemen who introduced them. But the fact of their introduction will tend to make others averse to every proposition to give aid to the mining interests, and we are surprised that these gentlemen could be led to present them, even if it was "only to oblige a friend."

ARIZONA INDIAN MATTERS.—Governor Safford, in his message to the Legislature, delivered Jan 16th, devotes considerable space to the Indian question. He advocates the extermination policy towards the Apaches, and this policy seems to have gained ground among our Eastern friends. He recommends raising volunteers in the country, who are inured to the climate, acquainted with the Indian habits, and fighting for their own homes, as they would be the most efficient soldiers and more economical to the Government than regular troops. From present appearances, with Gov. Safford to do the arguing and Gen. Stoneman to do the fighting, the Apache stands a good chance of being "cleaned out."

A GOOD APPOINTMENT.—A better appointment, if ability and honesty are considered, could hardly have been made than of Prof. W. P. Blake as Geologist and Mineralogist of the San Domingo Commission. The professor's report will be a good one, and will carry much influence with it.

PATENTS & INVENTIONS.

Full List of U. S. Patents Issued to Pacific Coast Inventors.

[FROM OFFICIAL REPORTS TO DEWEY & CO., U. S. AND FOREIGN PATENT AGENTS, AND PUBLISHERS OF THE SCIENTIFIC PRESS.]

FOR THE WEEK ENDING JANUARY 3d.

SEWING-MACHINE FOR WORKING BUTTON-HOLES.—Eugene Moreau, San Francisco, Cal., assignor to himself, James W. Haggerty, and Samuel Hill.

WHEELBARROW-FRAME.—Boekwith W. Tuthill, Oregon City, Oregon.

CAR-WHEEL MOLD.—William Ellison Worth, San Francisco, Cal.

REIN-HOLDER.—William Barstow, San Francisco, Cal. Antedated, December 30, 1870.

FOR THE WEEK ENDING JANUARY 10th.

ROLLER-SKATE.—Matthew H. Kimball, San Francisco, Cal., assignor to himself and James Garvey, same place.

PUMP.—Nathaniel P. Sheldon, San Francisco, assignor to himself and Wm. H. Hall, of San Jose, Cal.

FOR THE WEEK ENDING JANUARY 17th.

PORTABLE CAMP-GRATE.—Lorenzo D. Gavitt, Los Angeles, Cal. Antedated, January 7, 1871.

ENDLESS-WIRE ROPE-WAY.—Andrew Smith Hallidie, San Francisco, Cal.

SHINGLE-MACHINE.—Holiday C. Babcock, Eureka, California.

WATER-METER.—Frederick G. Hesse, Oakland, Cal.

MODE OF MAKING BRICKS.—Francois Lambert, Los Angeles, Cal.

WATER-WHEEL.—Albert L. Moore and Norman S. Parker, El Dorado, Oregon.

WHISKY.—H. Webster & Co., San Francisco, Cal.

Notices of Recent Patents.

DIRECT ACTING STEAM ENGINE.—W. D. Hooker, San Francisco. This is an ingenious and, apparently, very efficient improvement in that class of steam engines which are particularly adapted for steam pumps and the like, where it is necessary to be able to start the piston from any point in the stroke,—an important object which it is difficult to obtain with certainty. Mr. Hooker's invention consists in a combination of valves to effect this, and a combination of the main and auxiliary valves with the main piston of the engine, so that the action of the valves is made certain. For a pin projects into the cylinder, in such a way that the piston strikes this and thereby moves the auxiliary valve, so that no ordinary trouble can prevent its admitting steam to the main valve. It consists also in an arrangement for arresting and cushioning the piston at the end of the stroke, this being in connection with the action of the auxiliary valve just alluded to. The details of the construction cannot, of course, be plainly and fully described without the aid of explanatory drawings, and we can therefore merely touch on one or two points in a general way; but the invention deserves the careful examination of mechanics.

TIRE FOR TRACTION ENGINE.—O. Hyde, Oakland. The advent of the Thompson Road Steamer has awakened a new interest in the matter of traction engines, and rendered any subject connected with them of special importance. The rubber tire being the principal point, there is nothing more natural than that efforts should be made to improve this. Mr. Hyde has introduced a very ingenious device of the kind. He employs cylindrical or polygonal blocks of rubber placed side by side around the wheel. These blocks can have a central hole in order to have greater contractive and expansive power. The triangular spaces between the outer parts of the blocks are filled by wooden or metallic wedges, which are secured to the vertical rims of the wheel by links, which extend downwards at an angle and are bolted to the rims, the bolts passing through slots so that they can play back and forth as the

wedges are compressed and return to their original position. These wedges unite the whole into a compact tire and prevent the elastic cylinders from being displaced. By this combination and arrangement, the metallic tires of traction wheels can be encircled with a cheap, substantial and efficient elastic tire which can easily be fitted and easily repaired in case of necessity.

IMPROVED BEE-HIVE.—J. R. A. Williams, Colusa, Cal. Mr. Williams has invented a hive which will tend greatly to improve the health of the bee, and afford protection against its enemies. For this purpose, the hive is so constructed as to secure perfect ventilation of every portion of the hive, where ventilation is necessary, and the entrance is so arranged as to provide against the inroads of the bee-moth or miller. These important objects are secured in a simple but ingenious manner, and advantages obtained thereby are such as to recommend the device to all lovers of sweets and persons owning apiaries.

The Gerrish and Hinkle Furnace.

Our illustrations show the construction of a furnace for smelting ores, which has

with a circular aperture in the middle of a proper size; for the furnace has a circular section. On this plate rests all of the upper part of the furnace, so that the walls, A, at the melting zone which are most exposed, can be removed without touching any part above this iron plate.

The upper part of the furnace terminates in an arched canal or flue leading into a shaft. At the top of this is a reservoir, F, from which there falls a shower of water. This shower aids and regulates the draft and condenses the condensible part of the fumes, which collects in the water tank, D, on an iron plate, whence the mass can easily be removed. The remaining gases then rise up the adjoining shaft to the chimney. The surplus water at D is drawn off and can be pumped up into the reservoir, F, for further use.

The tuyers, B, may be as numerous as desired, and may be supplied with heated air, or air and superheated steam. The air (or air and steam) is carried through a

GERRISH AND HINKLE'S HOT AIR AND STEAM SMELTING AND CONDENSING FURNACE

SECTIONS SHOWING THE ARRANGEMENTS FOR HEATING THE BLAST.

lately been invented by Messrs. George M. Gerrish and Philip Hinkle, of this city, and which is protected by a caveat taken out through the SCIENTIFIC PRESS Patent Agency.

The points noted particularly are the improved method of constructing the furnace, so that the upper part is supported independently of the lower portion, which can thus be repaired or removed at any time without disturbing the rest of the furnace; the employment of a free spray of water to condense the vapors and to aid in increasing and regulating the draft; and in the use of heated air or air and superheated steam for the blast. These points will be understood more fully by a reference to the engravings.

On the furnace foundation are built four solid masonry walls, which rise about three feet high and which enclose a proper hearth composition which is firmly tamped in, and out of which is cut the ercible and the tap-hole. On this wall, at the four corners, are four pillars, about six feet high (for a furnace 32 inches in diameter), on which rests an iron plate, cast in four sections, fastened in a solid manner, and

series of tubes, E, arranged over a fire-place, and thus thoroughly heated before entering the furnace. The escaping heat from the fire-place enters the escape shaft of the furnace, and thus materially assists the draft. This is denoted in the lower right-hand cut. In the engravings, the tap-kettle is marked G, and the place for removing the slag is denoted by I.

The construction for condensing and collecting the fumes may be also used for roasting furnaces, for which it is equally applicable. Two furnaces can be built so as to lead into one chimney, thus economizing materially in the cost of construction. The inventors state that two furnaces thus built, capable of smelting 30 tons daily, can be constructed, complete in all the details, for about \$7,000.

The inventors believe that they have a furnace which is particularly applicable to the wants of the coast, and which will prove most advantageous and timely, now that there are so many new smelting operations projected. They invite the attention of smelters to their construction. Persons desiring further details may apply to Messrs. Gerrish & Hinkle, San Francisco.

The Thompson Road Steamer.

In accordance with an invitation from Mr. G. D. Roberts, we went over to Oakland, last Saturday, to witness the performance of the Thompson Road Steamer. Quite a number of gentlemen were present, including Gov. Haight, L. L. Robinson, Judge Lake and other prominent individuals. Attached to the steamer was an omnibus, which was filled, inside and out, while six or seven gentlemen took positions on the engine, and several boys "hung on" behind the omnibus. The wagon moved from the corner of Washington and Seventh streets, down Eighth street to Adeline, back on Twelfth to Broadway, and then down the San Pablo road. Both single and double gear were used, and the steamer was steered from one side of the road to the other with ease. It ran easily, through deep mud in places, and otherwise acted satisfactorily.

The coal employed was of poor quality, as was the stoking, so that there was at no time a pressure of over 60 lbs. of steam. On the San Pablo road a supply of water was taken in, and a fresh start was made. But here a mishap occurred. At the water-tank a pool of water had been standing for an indefinite period of time, forming a deep mud-hole. Into this hole one wheel sank nearly three feet. The steamer was thus tipped on one side, so that the upper wheel had no grip, and the gears around the gearing rested on hard ground, so that the lower wheel could not reach bottom. Had both wheels sunk in, the steamer could have extricated itself; but its peculiar position, with no grip on either wheel, rendered digging and pulling necessary.

As the time for the return of the party to San Francisco was near at hand when the steamer was extricated, the proprietors were unable to do more than repeat the performances on the road back to the depot. Previous performances, even in going across a similar ditch, have proved the good qualities of the steamer, and we regard the present trip as no fair test of its qualities. The steamer is now on exhibition at Woodward's Gardens, and we are promised further tests in plowing and in dragging heavy teams over rough and steep roads.

After witnessing experiments at New Jersey, John Young (acting for his father, Brigham Young) was so well satisfied with the qualities of the engine, that one has been ordered for use in Utah. We believe that its introduction will be of advantage to our coast, and that, judging from what the steamer has actually done, it can perform all that is claimed of it. We shall report its further tests as they occur.

THE TECHNOLOGIST still continues to improve. For thoroughness and reliability, and for high aims and attainments, it has no superior in the United States. It contains two full-page engravings on tinted paper, one of an architectural and the other of a mechanical subject, besides several other illustrations, all in first-class style. It deserves the support of all who desire to have a really good industrial publication, and is well worth its subscription price,—\$3 yearly. Specimen copies can be obtained of the Industrial Publication Co., 176 Broadway, N. Y.

THE MINES OF UTAH, their Location and Development, is the title of a pamphlet, written by Eli B. Kelsey, which we have just received. It gives a history of the various mining camps, and a description of the districts in the Territory.

THE GAS LIGHT JOURNAL has put on a new dress this year, which is more becoming than the old one. The paper is a very valuable one, which we always read with much pleasure and profit. If it desires our recommendation, it can have it cheerfully.

HOUSEHOLD READING.

Health.

Dr. Trall, a writer of note upon medical subjects, describes health as "the natural play of all the functions;" and as none of the medical profession have given us any thing better, I shall accept it as a correct definition, and endeavor to show my readers how inevitably we are bringing premature death upon ourselves and ruin to the nation through ignorance of the laws of health.

We are a nation of invalids; not an individual in perfect health can be found; scarce any in the moderate enjoyment of that greatest of God's blessings! The rule is sickness, and health is the exception, among our women and children in particular.

Can this condition continue and not grow worse? And if worse, does not annihilation of the race follow sooner or later? Yet we are intelligent and liberal, spending annually millions of dollars in schools and reading matter; endowing scores of medical colleges for the education of our young men (and women too now) and not a town or village but can boast of its two or twenty doctors, who hold the same position in society as the minister—one caring for and curing the souls of men, and the other their bodies; with this difference:—one aims to prevent crime by a pure life; while the other holds out a palliative, in the shape of drugs, to avert the suffering caused by wrong habits of life, etc.,

No minister believes or teaches his people that they may lie, steal, and slander their neighbor, and by a repentance merely, be saved through their (or the clergyman's) prayers! No, a repentance (recognition of sin) is necessary, and then "cease to do evil and learn to do well" must follow before the "holy man" can cure the soul; proving conclusively that the soul purifies itself, through pure teaching and pure living.

And just so with the body. Through unphysiological habits, in eating, drinking, etc., we defile the body, filling it with impurities (pork, fine flour, whiskey, etc.) until the condition called disease follows. The doctor comes and drugs the patient, adding more impurities, until the victim dies, or recovers, in spite of the drugs.

And now compare the two teachers: does the physician tell the patient the cause of his illness; how to avert it, and so keep his body the "pure temple" which the Bible speaks of? Oh, no; for perhaps he honestly believes sickness to be the lot of man, or a visitation of God, intended to purify his soul (not body) and teach patience and godliness.

Think of it,—a sick man capable of studying, God's laws, which the well man rejects or is not deep enough to fathom.

Health is the time for learning God's laws and obeying them. And if our physicians are ignorant of these subjects, they should be instructed; or if they already understand Hygiene and fail to teach it to the people who constitute their "flock," they are certainly to blame. Should not our doctors of medicine, like our doctors of divinity, endeavor to teach the people how to avoid the sin of sickness?

That there is a way so to live, in harmony with our natures, as to keep well, (even with our inherited diseases following us "to the third and fourth generation") accords with our intelligence upon the healthfulness, of domestic animals and all vegetable life, which subjects are considered important studies for our scientific men. Not only do they study the conditions of disease but acquaint themselves with the normal habits of animals and plants, and place them in such relations as will best supply what is requisite for their perfect health, well knowing that it is only in health that they can expect them to be beautiful and perfect of their kind. And why not desire the same for the human race?

Do not "nature's laws" operate alike with them as with the lowest forms of life? Do we not desire only the intelligent, true, social and healthy for our friends and relatives, feeling a just pride in so choosing? And are there not spent annually millions of dollars in our churches, public schools, colleges, alms houses, hospitals, prisons, etc. to improve the people? Yet how few are earnest enough to search for the hidden causes underlying the continued needs for these institutions, by removing which we

avert the desire to commit crimes against soul and body. In future articles I may possibly show how, by studying the laws of our natures and obeying them, we may not only be healthier, but happier.

L. F. J.

A NEW WAY TO COOK MEAT.—A good way to cook meat is to seal it in a vessel hermetically tight. Cooked thus a long time in its own juices, it is rendered very tender, and has a peculiar, appetizing flavor.

Take an earthen jar that will stand heat, with tight fitting cover. If beef is to be the dish for dinner cut in convenient pieces, lay them in the jar, rub each piece with salt and pepper and a little lump of sugar, put in a little water; lay on a piece of thick buttered paper and press down the cover. If you think it will allow any steam to escape, mix shorts or rye meal with water to a paste; press strips of this all round the edge of cover. Bake in a moderate oven four or five hours, according to tenderness of meat. Chickens or turkeys are excellent cooked in this way. The toughest old hen can be rendered toothsome by this process. A good plan for fowls is to put in the bottom some strips of carrots, a little onion, if liked, with bread crumbs, red pepper, and lumps of butter, with the seasoning as above.—*Western Rural.*

VEGETABLES.—Vegetables intended for dinner should be gathered early in the morning. A few only can be kept twelve hours without detriment. When fresh-gathered they are plump and firm, and have a fragrant freshness no art can give them again after they have lost it by long keeping, though it will refresh them a little to put them into cold water before cooking. A little soda in the water they are cooked in will help to preserve the color of those that are green. They lose their good appearance and flavor if cooked too long, and are indigestible if not cooked enough; close attention and good judgment are necessary to know the proper time to take them up. Always drain the water from them well before sending to table; have the dishes hot upon which they are placed, and never send them to table until the meats are served; when sent in too soon, and often uncovered, they become chilled and unfit for use. Always put vegetables to boil in hot water.

FOOD MEDICINES.—Dr. Hall relates the case of a man who was cured of hiliouness by going without his supper and drinking freely of lemonade. Every morning this patient rose with a wonderful sense of rest, refreshment, and a feeling as though the blood had been literally washed, cleansed, and cooled by lemonade and the fast. His theory is that food may be used as a remedy for many diseases successfully. For example, he instances cures of spitting blood by the use of salt; epilepsy and yellow fever, watermelons; kidney affections, celery; poison, olive sweet oil; erysipelas, pounded cranberries applied to the parts affected; hydrophobia, onions, etc. So the thing to do in order to keep in good health is to know what to eat, and not what medicine to take.

DISINFECTING HOUSES.—A ready method of disinfecting houses in which cases of scarlet fever have occurred is recommended by the Food Journal. It is this: Dissolve in a certain quantity of water as much saltpetre as it will hold: and in the solution soak several sheets of coarse blotting paper, which must be allowed to absorb as much as possible. Carefully close every door, window and chimney of the affected room, and let the prepared blotting paper be lighted and smoulder itself out. This method is said to be efficacious, and is certainly easy of trial.

TO STOP BLEEDING.—It is said that bleeding from a wound, on man or beast, may be stopped by a mixture of wheat flour and common salt, in equal parts, bound on with a cloth. If the bleeding be profuse, use a large quantity, say from one to three pints. It may be left on for hours, or even days, if necessary. The person who gave us this recipe says that, in this manner, he saved the life of a horse which was bleeding from a wounded artery. The bleeding ceased in five minutes after the application.

POTATOES, as usually cooked, are probably the most objectionable article of food which can be presented to a weak digestion. The starch granules are but half ruptured, and are held together by cellular tissue, so that they are reduced by mastication only into small pellets, which require long soaking in gastric juice before they can be broken up sufficiently for solution.—*Chambers on Indigestion.*

CAKE AND CANDY.—A celebrated physician says that it is cake that ruins the teeth and not candy, as is generally supposed.

Domestic Receipts.

POOR MAN'S PLUM PUDDING.—One cup chopped suet, one cup molasses, one cup sweet milk, one egg, two cups flour, a pinch of salt, nutmeg and cinnamon. Stir all together; then add one pound raisins and one pound currants; wet the cloth in cold water previous to putting the pudding into it. Boil four hours. To be eaten with wine sauce.

GERMAN CAKE.—One cup butter, two cups sugar, one cup sweet milk, three eggs, two cups flour, one tea-spoonful soda and two tea-spoonful cream of tartar; mix all together and flavor with lemon. Sprinkle the top thick with ground cinnamon before baking. Ice as soon as baked.

STEAMED BROWN BREAD.—One cup sweet milk, one cup sour milk, half cup molasses, one cup flour, two cups Indian meal, one tea-spoon soda. Pour into a mold and tie down tightly. Put into boiling water and steam from two to three hours.

TO MAKE GRAHAM GEMS.—Stir Graham meal into cold soft water or milk to the consistency of a thick batter. Beat well with the spoon and drop into hot greased gem pans (either tin or cast-iron ones). Bake in a very hot oven.

PLAIN RICE PUDDING.—One teacup of rice, one teacup of sugar, a little salt and two quarts of milk. Flavor with cinnamon or lemon and bake slowly two hours.

SAGO PUDDING.—Pare and core six sour apples; lay in a large dish one cup brown sugar and three-quarters cup sago; fill the dish with cold water and bake two hours. Any other fruit may be used in place of the apples.

HOW TO KEEP A MUSTARD PLASTER MOIST.—By adding a little syrup or molasses in mixing a mustard poultice it will keep soft and flexible, and not dry up and become hard and uncomfortable, as when mixed up with water alone. A thin paper or fine cloth should come between the plaster and skin. The strength of the plaster is varied by the addition of more or less flour.

CRUMPETS.—Take three teacupful of raised dough and work into half a teacupful of melted butter, three eggs, and milk to make a thick batter. Bake in a hot, buttered pan, in half an hour.

Mechanical Hints.

HOW TO BORE HOLES IN GLASS.—Any hard steel tool will cut glass with great facility when kept freely wet with camphor dissolved in turpentine. A drill-bow may be used or even the hand alone. A hole bored may be readily enlarged by a round file. The ragged edges of glass vessels may also be thus easily smoothed by a flat file. Flat window glass can readily be sawed by a watch spring saw by aid of this solution. In short, the most brittle glass can be wrought almost as easily as brass by the use of cutting tools kept constantly moist with camphorized oil of turpentine.

PARCHMENT PAPER.—Paper can be readily converted into vegetable parchment by immersing it for a few moments in a mixture of two volumes of sulphuric acid and one of water. The acid should be washed off the paper by immersing and slightly agitating it in a large quantity of cold water. The last trace of acid may be removed by finally immersing the paper in water to which a small quantity of ammonia has been added. To prevent contraction or wrinkling, the paper should be stretched on a frame while yet wet. Paper so prepared is transparent, and can be used for tracing paper; and may also be employed as a very good substitute for sheepskin parchment.

SOMETHING ABOUT ISINGLASS.—J. L. Souberaine, who has recently examined the different varieties of this article, points out these distinctions: Russian isinglass dissolves very rapidly in hot water, seldom leaving over 2 per cent. of insoluble residue; it is pleasant to the taste, and yields a firm and transparent gelatine. Bengal or Indian isinglass dissolves readily, but leaves a much larger proportion of residue—from 7 to 13 per cent.; it often has a fishy taste, and its gelatine is not clear. The gelatine obtained from Brazilian isinglass is opaque and acid. The isinglass prepared in China is seldom exported.

ARTIFICIAL TABLETS may be made as follows: Equal portions of ivory dust or shavings, and gelatine or albumen, worked into a paste, and afterwards rolled out into sheets, allowed to harden, and afterwards cut to the required size.

VARNISH FOR DRAWINGS AND LITHOGRAPHS.—Take dextrine 4 parts, alcohol 1 part and water 4 parts. The drawings should be prepared previously with two or three coats of thin starch or rice boiled and strained through a cloth.

Life Thoughts.

It is far better to suffer than to lose the power of suffering.

EXPERIENCE is the father, and memory the mother of wisdom.

CENSURE is the tax a man pays to the public for being eminent.

It is easy to look down on others; to look down on ourselves is the difficulty.

We cannot conquer fate and necessity, yet we can yield to them in such a manner as to be greater than if we could.

He who pleases himself without injuring his neighbor, is quite as likely to please half the world as he who vainly tries to please the whole world.

WHEN fame is regarded as the end, and merit as only the means, men are apt to dispense with the later, if the former can be had without it.

BASE all your actions upon a principle of right; preserve your integrity of character, and in doing this, never reckon the cost.

It is with our thoughts as with our flowers—those that are simple in expression carry their seed with them; those that are double, charm the mind but produce nothing.

ALWAYS laugh when you can—it is a cheap medicine. Mirthfulness is a philosophy not well understood. It is the sunny side of existence.

WITHOUT love we are unhappy; with it we are still unsatisfied, and long ever for our ideal which we can only reach in heaven.

THE highest genius never flowers in satire; but culminates with that which is best in human nature.

Old Age Without Religion.

Alas! for him who grows old without growing wise, and to whom the future world does not set open her gates when he is excluded by the present. The Lord deals so graciously with us in the decline of life that it is a shame to turn a deaf ear to the lessons which He gives. The eye becomes dim, the ear dull, the tongue falters, the feet totter, all the senses refuse to do their office, and from every side resounds the call: "Set thine house in order, for the term of thy pilgrimage is at hand." The playmates of youth, the fellow-laborers of manhood, die away and take the road before us. Old age is like some quiet chamber, in which, disconnected from the world, we can prepare in silence for the world that is unseen.—*Tholuck.*

HONEST INDEPENDENCE.—A tree must be rooted in the soil before it can bear flowers and fruit. A man must learn to stand upright upon his own feet, to respect himself, to be independent of charity or accident. It is on this basis only that any superstructure of intellectual cultivation worth having can be built.—[*Froude.*]

It is quite the fashion to drop now and then a lump of piety into personal conduct, but too often there is little care to "work it in." A life properly seasoned with grace has a uniform flavor.—[*W. H. Beecher.*]

A lazy boy makes a lazy man just as a crooked sapling makes a crooked tree. Those who make our great and useful men were trained in their early boyhood to be industrious.

YOUR STANDING AT HOME.—We often hear the question asked of such and such an one "What is his standing in society?" or "What is his standing in the church, or among business men?" But never think of asking, before we take him into our confidence, "How does he stand at home?" And yet the man who can make reply to this question with an untroubled heart and clear conscience is a hero not so often met with, but that he is worth looking after, and closely cultivating.

"O! I FORGOT."—Of all the despicable excuses offered for omission of duty or neglect to fulfil an appointment, the most contemptible is the stereotyped phrase. "I forgot it." Many persons think that a sufficient apology for the neglect or omission of any promise; with us it is the worst. The great French Minister, Talleyrand, once said, "a blunder is worse than a crime, for a crime may be the effect of circumstances, it may be guarded against, or it may never occur again; but a blunder is always likely to occur." We can forgive a crime, but not a blunder. The man who is always forgetting is utterly unfit for any public position.

OUR U. S. AND FOREIGN PATENT AGENCY presents many and important advantages as a Home Agency over all others by reasons of long establishment, great expe-
rience, thorough system, and intimate acquaintance with the subjects of inventions in our own community. All worthy inventions patented through our Agency will have the benefit of an illustration or a description in the SCIENTIFIC PRESS. We transact every branch of Patent business, and obtain Patents in all civilized countries. The large majority of U. S. and Foreign Patents granted to inventors on the Pacific Coast have been obtained through our Agency. We can give the best and most reliable advice as to the patentability of new inventions. ADVICE AND CIRCULARS FREE. Our prices are as low as any first-class agencies in the Eastern States, while our advantages for Pacific Coast inventors are far superior. ENGRAVING ON WOOD, of every kind, for illustrating machinery, buildings, trade circulars, labels, plain or in colors, designed and cut in the best style of the art by experts in our own office. Also, engraving on metals.

STEVENSON'S PATENT MOULD BOARD AMALGAMATING PAN

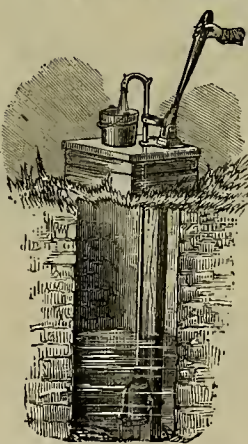

This Pan is far superior to all others in several important particulars. The grinding millers are near the center, re-
quiring less power. The plow-shaped grooves raise the quicksilver with the pulp regularly, with less power, without violence, and with better amalgamating effect, besides admitting of a larger charge. The inclined-shaped housings of the miller plate openings efficiently force the pulp directly under the mul-
ters.

It has been constantly running for over eight months, and has proved, in competition, to produce a higher per-
centage of bullion, with less power and with great saving of quicksilver, over any other pan in use. It is simple in construction and operation, and cheaper in first cost and economy in wear.

Manufactured at the Golden State Iron Works (Co-operative), 19 First street, S. F.,
Where it can be examined and further particulars be learned; or persons may apply to the inventor and pat-
entee, Mr. C. C. STEVENSON, at the Douglas Mine, GOLD HILL, STATE OF NEVADA, where the Pans have long
been in constant operation.

THE AMERICAN SUBMERGED PUMP.

Has no leather packing, is composed entirely of metal, rendering it less liable to get out of repair than the ordinary packed pumps. It is admirably adapted for Irrigating purposes and for Watering stock.

As a Safeguard against Fire it has no Equal,

One of the medium size being capable of protecting an ordinary frame dwelling. In short it is an article that

Every Farmer should have on his Premises.

Things and Events at White Pine.

(Written for the Press.)

Smelting Operations.

The advent of winter in this altitudinous region has somewhat checked the ardor of smelting operators, as well as the fires of their furnaces. In fact, we have now but one furnace in operation, the Alsop, at Shermantown, which has been leased by two different sets of smelters within two weeks. The Eagle furnace, at Swansea, had been leased to one Martin; and during his possession of the works, behold, they took fire and were themselves reduced—to ashes and cinders. The miners who had trusted the lessee for large quantities of ore are now whistling for their pay. The Alsop was leased by Turner & Powers, of Hamilton; and, after a week's run, the bullion was attached by a charcoal man to secure pay for the fuel used in its production; but the "poor miner," as usual, goes without his remuneration, having no money to throw away for legal means of redress. Another party is now in possession of the Alsop, who seek to smelt ore "on shares" with the miners, the "lion's share," of course, to go to the smelter; but the miners cannot now "see it." Indeed, so numerous and unscrupulous have these Jeremy Diddlers become, that it is doubtful if another pound of ore leaves the Base Range without its equivalent being left on the dump in cash.

Even the great and much-vaunted Rothschild works, at Hamilton, erected by Chicago capitalists at a cost of fifty or sixty thousand dollars, are now under attachment for charcoal, ore, labor, and even for the butcher's and grocer's bills. And yet these works turned out 600 tons of base bullion, containing an average of \$200 in silver per ton, equivalent, with the lead, to \$170,000 in value. The cost of the works, and the running expenses for 60 days, could not have exceeded \$90,000. Deducting freight charges on this bullion, the company must have made the round sum of \$50,000 in this 60 days! And yet, "the butcher, the baker, the miner and (I suppose) the undertaker," must wait for their pay until the returns are received from the dealers in metals in New York City; perhaps a great while longer.

It seems strange that the smelters cannot be satisfied with the large legitimate profits of the business, but must take every means to circumvent and defraud the producers of ore, without whose labor no furnaces could be run at all. The small pittance per ton paid for the raising of the base ore does not equal one-fifth of its value as bullion; and this is the great temptation to men without means to start smelting furnaces, and "chisel" the miner of his hard-earned remuneration.

As you observed in a late number of the Press, no smelting works should be started without ample capital, in order to enable the proprietors of such enterprises to keep their works in operation while much of their capital is locked up in ore, fuel and bullion in transit to a market. Such "enterprises" as those which have been entered upon in White Pine bear too much the character of the operations of the "confidence man" and dishonest operators generally.

Miner's Co-operation.

There was some hope that the miners of this locality would form a co-operative union to smelt their own ores, but after repeated meetings for discussion of the project, the whole matter ended in talk. Nothing can be done now but to wait events or abandon the mines. Should the Rothschild works come out from under the present cloud, and resume operations shortly, and pay cash for ore and other necessities of life, as the company boasted in the beginning they could and would, the Base Range will continue to yield large quantities of argenteiferous carbonate of lead, as heretofore.

The White Pine Smelting Works, at Swansea, of which Mosheimer is the putative father, have been sold by the sheriff, and bought in for the original company, thus disposing of sundry bills against the institution, presented by "the butcher, the baker," and the rest.

The Mills.

The two English Companies, who recently purchased the best mines on the hill called Treasure, are going ahead rapidly. The International mill of the Eberhardt Company is nearly completed. There is a rumor in circulation that this company in-

tend to erect large smelting and separating works in the spring.

The Big Smoky mill at Hamilton has put up a Brückner roasting furnace, and is meeting with great success in the volatilization of base metal in ore containing as high as 30 per cent. of lead. This will bring to mill a large class of ores rich in silver, which the smelting furnaces cannot handle with profit.

The Monte Christo mill also has a roasting furnace in operation, but of the Stetefeldt pattern. The work performed by this furnace is also of the most profitable kind. The Stetefeldt is being introduced in other parts of the state and gives great satisfaction.

The business of custom milling in this district is rapidly declining, and some of the mills will be removed to other localities. The cause is, the purchase of a number of the most valuable mines of free ore by English capitalists, and the erection by them of their own mills.

Rush to Utah.

There is a "stampede" of miners for the scene of the new discoveries of the precious

Brown's Piston Packing.

The importance of a good packing, and the great difficulty in getting a *really* good one, are well known to every mechanical engineer. The desideratum of a tight-fitting piston, without great wear on the cylinder and on the packing-rings, seems yet to be fully supplied. Thus, at the meeting of the Master Mechanics' Association, the Committee on Packing remarked in their report that "concerning piston-packing, they were unable to furnish a report of well-proved success, of full results upon any particular pattern of the many varieties now in use, etc."

We have lately received a description of a piston-packing, here illustrated, which is claimed to come nearer to supplying all the wants of the case than is done by others. This is the Brown Patent, which has been confined in its use, until very

BROWN'S PATENT PISTON PACKING.

metal in Utah. Men are going in companies of a dozen or more, in twos and threes, and as "solitary horsemen." This section will be depopulated to increase the Gentiles and make it warm for Brigham and his patriarchal institution. So we go. As old Dr. Watts wrote,

"Heedless men heedless fly
From vanity to vanity."

No doubt much of the labor in the mines of Mormondom will be as much labor in vain as in White Pine or any other mining region. But Hope always tells a flattering tale and many are deluded thereby. Yet there is no denying the fact that there are rich mines in Utah, as there are in White Pine and many another mountain country. But those who get rich from working them will be fewer in number than the drawers of prizes in the Mercantile Library Lottery.

MINER.

GOLD IN ILLINOIS.—Peoria, Illinois, is built over a gold mine, an inexhaustible gold mine, says the *Transcript* of that city on the authority of Mr. Taylor. Mr. T. is a well-digger who knows all about mining, having "conversed very often with California miners;" consequently he knows from the start that the deposits are there and that they are inexhaustible. Let every Peorian immediately proceed to turn his house into a quartz mill.

lately, to the Delaware, Lackawanna and Western Railroad. It has been used here, however, we are told (on the Cayuga Division), for three years, on 8 and 10-wheel engines, on ascending grades varying from 100 to 125 feet per mile, steam pressure on boiler, 120 pounds to the square inch, cutting off steam 16 to 18 inches, and hauling train tonnage 200 tons, exclusive of engine and tender, "not showing the least leakage after one year's wear."

This packing differs in its construction and principle from the various kinds in use; instead of applying the steam in the piston head, to force out the rings to make a tight-fitting piston, to fit the bore of the cylinder, as various kinds do, it operates the reverse. It is simply accomplished by the difference in diameter of steam fitting rings, and the diameter of cylinder. The two rings, FF, are turned three-sixteenths of an inch larger than the bore of the cylinder, and a section is cut out sufficient to allow the ring to come together and fit over the pins on L-shaped rings. The details of construction are shown in the engraving. The piston rod, A, is attached to a plate, B, upon which is cast a spider, C. To this spider is bolted a counter plate, D. The ends of the four radial arms of the spider,

B, are turned to a true circle, the center of which is in the axis of the piston rod. Between the plate, B, and the counter-plate, D, and over the ends of the spider arms are placed the rings, E, F, G, in the order shown. The rings, E, have an L-shaped section, and over their vertical projections the cut rings, F, fit, a pin on each of the rings, E, fitting into a recess in each of the cut rings, F, so as to keep the cuts in a constant position to break joints. This gives a packing, it is claimed, with the least friction and wear, combined with great durability; while the wear is distributed equally on all parts of the cylinders, thus tending to keep it true.

The packing can be applied to any piston-head locomotive or stationary engine without any alteration. The inventor says: All I ask is, give it a trial and let it prove its own merits. It was patented by Mr. Francis A. Brown, Ithaca, Thompsons county, N. Y., to whom, or to Wiester & Co., 17 New Montgomery street (Grand Hotel), San Francisco, apply for further particulars.

A Miners' Convention.

J. Berton, Vice-Consul of France "having been authorized by a number of leading English and French capitalists to investigate and report, in his official capacity, the standing and resources of mining companies in California and other Pacific States; also, to devise some plan to check the sale of bogus mines abroad, and thus to protect foreign interests, while promoting at the same time the interests of bona fide and legitimate mining enterprises," has issued a call, inviting miners and capitalists to attend a Miners' Convention to be held at Sacramento on the 30th inst. when a Miners' Protection Union is to be formed. "The object of this institution shall be to exclude from foreign as well as home markets all the accumulated worthless mining stock; to restore the American, more particularly the Californian, credit abroad, by offering to foreign capitalists desirous of investing in mining enterprises, a reliable channel through which they will obtain a most safe and profitable investment."

Could some such bureau be formed and supported by well known persons in whom the public had confidence, and who were fully qualified for the position, it would be an excellent institution, not only as regards the interest of the State, but also with reference to the interests of the individuals composing it. But we are afraid that the present plan will not accomplish much. It has been advertised to a limited extent only,—but few persons know who have authorized the call and who will respond to it. Apparently anybody can join the Union, and every one who does so with a mine for sale will insist that *his* property is the best. We have no guarantee that unscrupulous persons will not get the management, on that responsible parties will have the conduct of affairs; and there is great danger of internal discord in such a combination. Suppose the institution is once fairly going, still its chances of a long life would be very doubtful. One mistake would damage its reputation before the general public, and endanger its existence. The American Bureau of mines at New York was an institution which had a similar purpose, to a great extent. Yet it was unable to live, although it contained several excellent men.

We have several mining engineers in this State who make it a business to report on mines, and who have acquired a solid reputation in their business. If these gentlemen could be induced to combine forces and start such a bureau, it might succeed; yet we doubt whether they would be willing to take such a step. While we should like very much to have such an institution exist as M. Berton proposes, yet we cannot find sufficient grounds to lead us to believe in its future success. We should be very happy to be disappointed in our expectations.

No. 17 New Montgomery Street, San Francisco.

PATENTS BOUGHT AND SOLD ON COMMISSION.

Longshores Combination Tool.

This device is just what its name indicates. As a Kitchen Tool it is indispensable. It will fit and lift with perfect safety, any Stove Lid, Frying Pan, Pie Pan, Pot, Kettle, or any other vessel or dish used about a stove. It is a complete tool for stretching carpets, driving tacks, pulling tacks, &c., &c. It answers the double purpose of hammer and pinners, and is also a good Nut Cracker. It is made of the best malleable iron, and the Hammer, Pinners and tack puller, are all hardened so as to stand the roughest usage. An Agent is wanted in every town on the Pacific Coast to sell this valuable little implement. Retail price fifty cents.

Logan's Rubber Back Lash Spring

Patented May 17, 1870. The attention of Manufacturers and Mill Owners is respectfully called to the above valuable invention for

Preventing Back Lash in Mill Gearing.

No argument is deemed necessary to convince an intelligent Miller of the importance of preventing back lash, as it is well known that both the quantity and quality of the flour depends largely upon the steadiness of motion of the Burrs. Whenever the motion is communicated by an engine having two points in the revolution of the Fly-wheel where no power is applied, there must be an unequal motion, and consequently more or less back lash. By the use of a very heavy fly-wheel or a high speed, this inequality of motion may be diminished but it cannot be entirely prevented, and more steam will be required than with a lighter fly-wheel or slower speed. By the use of

Logan's Patent Rubber Springs,

the Back Lash is entirely prevented. The pinion being loose upon the spindle, and the connection between them being by the springs, the action of the springs keeps the cogs of the pinion at all times firm against those of the driving wheel, while a continuous forward pressure is given to the spindle and through it to the Mill-Stones. The Right to the Pacific Coast is placed in our hands for sale at a very low price. Parties interested will please write for descriptive circular or call at our office and examine the model. A large number have already been sold and put into use in the Eastern States, and three are in daily use in a flour mill in this state. Parties buying territory will be furnished with the springs at manufacturing cost from the Factory in Illinois, or will be furnished with a sample to manufacture from free of charge.

New Gas Light.

This Light takes the place of the Candle, the Kerosene Lamp and Coal Gas. Each Lamp is a perfect Gas Factory, making its own gas as fast as it is required. It is a safe, cheap and beautiful light. Circulars and full particulars sent on application. A few good traveling agents wanted to sell this and other valuable Patents.

Hay Press.

The best and cheapest hay press in the United States. Presses furnished at manufacturing cost to parties buying County or State Rights. The profits on a few Presses will pay for a county Right.

New England Spring Bed.

The cheapest and best in the market. Rights for sale and beds at cost. Send for descriptive circular.

Machinery.

STEAM JET PUMP.

Blakess & Williams' Patent, for
Water, Oils, Acids, Etc.

This best COLD WATER PUMP for filling tanks for stationary or portable Steam Engines. Also highly recommended for MINES, DISTILLERIES, SALT WORKS, STONE QUARRIES, and similar places, and saves the expense of putting up and running an engine. We ask the attention of all proprietors of steam power to the following points of merit.—It is operated by steam taken directly from the Boiler into the Pump; it has no valve or wearing parts of any kind; it requires no belts, pulleys, or machinery of any kind; it operates entirely independent of an engine; it will not choke up with foul water; it costs much less to put up and start; it will not wear out in a lifetime, or require repairs; it is reliable, and certain to work at all times; it is not liable to injury from freezing.

Satisfaction guaranteed or the money refunded.

Send for Circular. PARKER & HUNT,
Southeast cor. Tenth & K Streets, Sacramento City Cal.
AGENTS—OSCAR V. GERZABEK, 117 California St., San Francisco; KEEF & BARGION, Stockton. 21v21-tf

HYDRAULIC CHIEF.

Fisher's Knuckle Joint and Nozzle is the best Hydraulic Machine in use. Mechanisms manufactured to order to throw from one to a seven foot stream. Hydraulic Machine No. 1. Manufactured and published by R. H. & J. C. Fisher, that they have sales pending in the United States District Court, which involves the working principle of my HYDRAULIC CHIEF. Is false. I caution all miners to beware of the efforts of the said Oregans to intimidate my patrons or effort money from them by false representations. I have a full patent for my Hydraulic Chief, granted Dec. 20th, 1870. No. of Patent, 110,422.

2v22-1ms

F. H. FISHER, Nevada City.

THE WILSON
Patent Steam Stamp Mill

This extraordinary Mill, now so justly popular in the East, is now offered to the miners of the Pacific Coast. Having been in operation now for about two and a half years, the Company feel confident that the

WILSON STEAM STAMP MILL,

For Durability, Efficiency,

AND ECONOMY OF WORKING,
HAS NO EQUAL.

The Wilson Steam Stamp Mill is the only Steam Mill that has had the severe ordeal of practical working, and proved itself eminently successful. It is now in operation in several of the Eastern States and Territories, and gaining an envious popularity. The whole machine is so simple as to be readily understood by the most ordinary minds. In fact, its simplicity is its durability. The expense of crushing rock or cement with this Mill is less than one-half the expense of any other Stamp Mill, and less than one-half the cost. For further particulars inquires of

FURMAN R. WILSON,

San Francisco.

Or of THE WILSON STEAM STAMP MILL CO., 326 Walnut street, Philadelphia, Pa.

NOTICE.—All persons are hereby warned not to manufacture or use any Steam Stamp Mills that are an infringement on the Wilson Patents, as they will be prosecuted to the utmost rigor of the law.

41 First St., San Francisco.

Varney's Patent Amalgamator.

These Machines Stand Unrivaled.

For rapidity pulverizing and amalgamating ores, they have no equal. No effort has been, or will be spared, to have them constructed in the most perfect manner, and of the great number now in operation, not one has ever required repairs. The constant and increasing demand for them is sufficient evidence of their merits. They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.

This Amalgamator Operates as Follows.

The pan being filled, the motion of the miller forces the pulp to the center, where it is drawn down through the aperture and between the grinding surfaces.—Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly passing a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.

Settlers made on the same principle excel all others. They bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed.

Mill-men are invited to examine these pans and settlers for themselves, at the office, 229 Fremont Street, San Francisco.

THE BEST PAPER

—AND THE—

BEST INDUCEMENTS!

This Quarter's 13 numbers SENT FREE to all subscribers before Dec. 25, 1870, for next year's

MOORE'S RURAL NEW-YORKER,

THE GREAT ILLUSTRATED

Rural and Family Weekly.

This is not only the Largest, Best and Cheapest, but by far the Largest-Circulating Journal of its Class! National in Character, Ably Edited, Superbly Illustrated and Printed, it is the

BEST AMERICAN WEEKLY!

It is the standard authority on all branches of Agriculture, Horticulture &c. As a Literary and Family paper it is a favorite from Canada to California. Indeed Moore's RURAL has no rival in its sphere, and is the largest illustrated Journal on the continent—each number containing sixteen Five-Column Pages, (double the size of most papers of its class).

A NEW FEATURE.

Among recent accessions to the RURAL's unequalled Editorial staff is that of Hon. T. HART HYATT, of Cal., as editor of the Pacific Coast Department—a new and valuable feature. By prompt mailing and rapid railroad transit, the RURAL now reaches the Pacific slope about the time of its date.

TERMS, INDUCEMENTS, ETC.

TERMS—\$3 a year of 52 Numbers, and only \$2.50 in clubs of ten. This Quarter's 13 numbers sent FREE, as offered above. Our club inducements for 1871 are unprecedented. Specimens, Premium Lists, &c., sent free to all forming clubs,—and we want a live Club Agent in every town. Address

GIANT CEMENT. GIANT CEMENT.

A most extraordinary and universally needed article for mending Furniture, Crockery, Glassware, Marble, Meerschaum Pipes, Ornaments, etc.; also splicing Leather Belting and patching Boots and Shoes. This Cement possesses extraordinary merit, and is in every way a first-class article. Every can is its own testimonial. Also, RUBBER CEMENT, for mending Rubber Boots, Shoes, Belting, Coats, and Hose without stitching! Easily applied, never failing, and perfectly waterproof. Both Cements are put up in TIN CANS ONLY, with full directions. Take no other. GIANT CEMENT and MINERS' RUBBER CEMENT are kept by Druggists and Dealers throughout the country. Country Dealers can be supplied by ordering from any house here or in Sacramento with whom they deal, or by sending direct to us. Send for Agents' Circulars and Price List, to Giant Cement Manufacturing Co., 419 Washington street, San Francisco

MINERS' RUBBER CEMENT. MINERS' RUBBER CEMENT.**New Patent Law.**

The New U. S. Patent Act of 1870 will be sent FREE on receipt of postage stamp to inventors and patentees, by DEWEY & CO., publishers, patent agents and engravers. San Francisco.

Blood's Patent Car Seats.

We of the present generation apparently do not have such stiff backs as our ancestors had. Many of us can remember how our grandmothers sat erect in their chairs, disdaining to rest against the chair-back. Theoretically, we don't know but what they were more correct in the principle than we are, but personally we always select that chair whose back presents the most comfortable rest.

Had these ancestors of ours been as much addicted to riding in railroad cars as we are, we think they might have modified their action, and sought to relieve their weary spines. But this last has hitherto been difficult of accomplishment. The straight backed seats become very tiresome, when one is jolted along for a considerable length of time, and how to secure a comfortable position has heretofore defied the most persistent efforts of the traveler.

The Chicago Railway Gazette describes these efforts well. It says: An erect sitting posture is quite comfortable at first,

VARIOUS VARIATIONS OF BLOOD'S IMPROVED CAR SEATS.

with sincerity, "Bless me, this is pleasant, riding on a rail."

affected instantaneously, allowing an easy, half-reclining position. Another shows

ones, can be assured,—an important item.

These changes are all made without trouble, by graduating the movement of the shifting irons to the desired position, and securing the wished-for arrangement by means of a lock attached to the shifters. All these are so simple that they can be effected by any one, without the necessity of calling on the conductor.

The adoption of this improvement does not involve any large expense. All that is necessary is a simple change of the irons on which the backs of the seats revolve, and this is effected at a cost of about three dollars a seat. The device being so important an improvement and the expense of introducing it so trifling, we naturally find it adopted on many routes; for any railroad, to succeed, must provide as well as possible for the comfort of the traveler. Such a contrivance on our overland railroad would be a great addition; and it would be in excellent place in the Emigrant cars. A small extra sum might be charged for these seats and thus much comfort could be secured at a small expense.

BLOOD'S IMPROVED CAR SEATS.

but the continual jar tends to render it monotonous and almost impossible to maintain, and here the traveler finds himself reduced to a choice from a few attitudes which vary considerably in their elegance but very little in their comfort. He slides slowly down until it is necessary to brace his knees high up against the back of the forward seat and here, in the shape of a horizontal interrogation mark, he finds a "brief bitter bliss" until his breaking neck and aching limbs compel him to resign it. The most ingenious traveler is seldom able to suggest to himself any improvement on these two luxurious positions, unless he be fortunate enough to secure, and keep, a double seat, in which exceptional case he can prop himself up with his baggage and devise a variation of his agony.

There comes now to our relief, a St. Louis inventor, whose device really seems most promising. This gentleman has furnished an arrangement by which one can obtain that variety of postures which is so necessary for comfort on a long trip. It now may be possible for the traveler to exclaim

Our engravings illustrate this device and present some of the variations which can be attained thereby. One illustration represents the seats in the common attitude. Another shows a change which can be effected

HALF RECLINING POSITION.

be attained thereby. One illustration represents the seats in the common attitude. Another shows a change which can be effected

AS A SOFA.

Mr. John H. Blood, of St. Louis, Mo., a brother of the patentee and part owner of the patent, is authorized to dispose of rights and make contracts with any road in the United States, for the introduction of their improved car seats.

BORAX IN NEVADA.—The borax deposits in Nevada are attracting considerable attention. We see it stated that they are thickly distributed over an area of 100,000 acres; also that a New York house is about to erect works, under lease, on one of the deposits, and that agents from London are coming in the spring for exploration.

HOOS TO JAPAN.—A notable article on export to Japan, by the steamer of the past week, was a lot of hogs, 1,000 of which have been sold for shipment. A part went by steamer, the rest will go forward by sailing vessels.

THE FIRST SUGAR REFINERY ever constructed in Central America, has recently been started by the Messrs. Deshon on their sugar plantation near Corinto, in Nicaragua.

MECHANICAL PROGRESS.

PEAT FOR GAS.—T. H. Leavitt of Boston, of whom the *Gas Light Journal* speaks as a recognized authority upon the subject, and from whose articles upon various peat uses we have more than once quoted in the Press, contributes an article to the journal aforesaid for Jan. 16th from which we take this extract: "It is well known that large quantities of peat are used for fuel in Paris; some concerns employing several hundred men in its production; and that by one or more of the gas companies outside of the city, it has been used for a considerable time for the manufacture of illuminating gas. A commission charged with the duty of investigating the matter for practical purposes made report, of which the following are, in substance, some of the items: The illuminating power of peat gas exceeds that of coal gas as 342 to 100. The manufacture of gas from peat is more simple than from coal. The peat, if put into an iron retort, and heated to a low red heat affords immediately a mixture of permanent gases and vapors, which condense into an oleaginous liquid, which two products separate on cooling. The oil is collected in a vessel, and the gas passes into a gasometer. This carburetted hydrogen, however, is of very low illuminating power. The oil, which is a viscous, blackish liquid, of strong odor, is subjected to a new distillation, and resolved wholly into a permanent gas, and hydrogen very richly carburetted. This mixture is strongly illuminating, yielding a flame six or eight times brighter than the first, and of remarkable brilliancy. The two are then mixed, and a gas of intermediate character obtained, which is delivered for consumption. A mean of five determinations gave for a burner of peat gas a light equivalent to 23½ candles, and the same burner with coal gas gave 6.3-10 candles. The illuminating power of the pure oil from peat as compared with gas from coal is as 756 to 100. The purification of peat gas is much more easily accomplished than coal gas. * * * From these data, it would seem that inducement is offered for our gas companies to attempt the utilization of peat. Moreover, it is known that some of our own peats are far superior for gas purposes to any on which are based the reports referred to. Many of our large cities are especially favored in this respect. Our Atlantic coast is abundantly supplied; Cape Cod is full of it; nearly one half of Nantucket is peat of excellent quality, and Martha's Vineyard affords a peat almost without limit, which as adapted for this special purpose, is probably unsurpassed by any deposit in the world, while vessels can come within fifty rods of it, loading at the minimum of cost."

COMPLETION OF THE GREAT GUN.—The London *Mechanics' Magazine* says: "On Tuesday, Dec. 13th, 1870, the final operation in the construction of England's greatest gun was successfully performed at the Royal Gun Factories, and the monster cannon now only requires to be vented and proved. The tube of the gun, which is about 16 feet long, was brought out of the factory in which it has been rifled, and fixed, muzzle downward, in a pit, under the most powerful crane which the Royal Arsenal possesses. The heavy breech-piece—a mass of iron weighing 15 tons, and in shape something like a tailor's thimble—was heated nearly to redness on an adjacent gridiron, in order to expand the metal, and was carefully lifted and dropped like a cap over the breech of the perpendicular tube. When cold, the caliber of the breech-piece was slightly less than the diameter of the tube, but the heat expanded it so as to allow nearly ¼ inch free play between the two, the cooling being afterwards assisted by jets of water. The gun weighs 35 tons 7 cwt.; the diameter at the breech is 4 feet 8 inches, and at the muzzle 1 foot 9 inches. The bore is rather less than 1 foot, and is rifled on the "Woolwich" system. It consists of an inner tube of steel tempered in oil, and incased in massive folds of wrought-iron in accordance with Fraser's double-coil system. With a gun so strongly built it is thought possible to throw a shot or bolt 700 lbs. in weight, and to pierce iron armor 15 inches in thickness, the ordinary charge of powder being calculated at 120 lbs. The shot will probably be three times the length of its diameter. The estimated cost is £2,500."

SEWING MACHINES.—"The number made by twelve principal companies during the past year amounted to 320,669, which, at the average price of a first-class machine, say \$75, aggregated \$24,050,170. The first-class American sewing machine is to be found in all quarters of the world, and the supply comes principally from this city and Boston. There are many cheap machines which are not counted in these figures; also many cheap imitations manufactured in England and on the Continent which are sold as of American make. Germany, in particular, does a very large business of this kind, Hamburg having no less than six large factories running, and finding a market principally in Russia. Notwithstanding this competition, the machines sent from this country command high prices, on account of excellence in workmanship. The largest number made by any one concern in a year was 86,781. As the cost of manufacturing good machines varies from \$12.50 to \$60, and the prices at which they are sold range from \$60 to \$350, the profits of the business are enormous."—*Sci. American*, Jan. 7th.

"COMPOSING" MACHINE.—Under this name the New York *Tribune* describes a new apparatus which is operated as follows: "The letters of the alphabet are arranged in regular order in a type-head two inches square, and are operated upon by keys, as in a piano. When the keys are touched, the type-head moves to its position, and action is had upon whatever letter is touched, the type moving downward a prescribed distance, and making a printed impression on transfer paper. The platen on which the paper is laid is moved by a feed-wheel, and the spaces between the lines are produced by lateral motion by means of a ratchet-wheel. The impressions are finally transferred to a zinc plate, and printed by a lithographic press. In place of transfer paper a mold of clay or wax may be used to receive indentations, from which a stereotype cast can be obtained."

HORSE-SHOE ROLLS.—The following description of Reese & Graff's machine at the Fort Pitt Iron Works, Pittsburgh, is credited by the *Iron Age* to "a local paper": "The machine has two horizontal rollers and one vertical. The horizontal are not exactly circular, their form being so proportioned that in every half revolution they gradually tighten down on one part of the iron, thereby giving thinness to the parts intended for the toe and thickness to those for the heels. The upper roll is provided, in a portion of its face, with two tongues which press the creases for nails; the lower with a sloping flange which produces the bevel. The vertical roll is to give the proper width. It is in the shape of an ellipse slightly pointed at either end of its longer axis. At its every half revolution the side of one shoe is compressed. Thus the shoes are at one rolling so complete that naught remains except to cut, punch and bend. We amused ourself in calculating the capacity of these machines. There are two trains. Each makes two shoes at every revolution. Their ordinary speed is 180 revolutions per minute. This would make 720 shoes every minute, or 1,036,800 daily. They are never run to their full capacity, however, owing to the fact that Messrs. Reese, Graff & Co. have not the means of heating more than 20 tons of horse-shoe iron daily."

LARGEST LITHOGRAPHIC PRESS IN AMERICA.—The *Scientific American* describes this machine,—"the work of Hughes and Kimher, of London,—and after detailing the steps of the old process of lithographing with the "scraper press", says:—"Now on the cylinder press every detail of this process is in its essential features performed automatically, except that the pressure is obtained by the weight of a heavy roller and powerful compound leverage connected therewith, which roller carries the paper and rolls over the surface of the stone, in lieu of the roller, tympanum, and scraper, above described. The moistening of the stone, and the inking of the plate, are done by ingenious self-acting devices which perform the work in the most thorough manner, the dampening of the stone and the inking being done two or more times for each impression, as may be desired. Any kind of work is performed better than it can be done by the old means, and from twenty to thirty times faster. The press from which our engraving has been made will print blocks 60 by 40 inches, and as good lithographic stones of this size are difficult to obtain and handle, zinc is now much used as a substitute. * * A peculiar advantage of the cylinder over the scraper, is that the cylinder wears the stone much less than the scraper, so that from 20,000 to 30,000 impressions may be taken from a single transfer."

SCIENTIFIC PROGRESS.

THE ECLIPSE OF DEC. 22d.—Reports are to the effect that the weather was more or less unfavorable for observation at nearly all the stations; and at Oran, Algiers, where were Prof. Tyndall, Dr. Huggins, and several other notables, fully equipped with every possible instrumental aid, it was still more unpropitious than at the European stations. *Nature* for Jan. 5th gives the report from that place as follows: "The morning of the 22d broke very doubtfully, heavy driving clouds obscuring the sun. The party were, however, all at their posts betimes, and arranged their various instruments long before the predicted instant of first contact. The clouds obscured the sun at this particular time; but soon, through a rift in them, the dark limb of the moon was seen encroaching on the sun's disc. Observation after this became very trying, as it was only possible at distant intervals to glimpse the progress of the moon, as she gradually advanced in her path. Spectroscopic observation, or even polariscope observation, was practically impossible. Finally a glimpse was caught of the sun some eight or nine minutes before totality as a very thin crescent, and then every clink and cranny in the clouds closed up, and one dense and impenetrable pall covered the earth. Nothing remained now but to go out of the tent and observe the effect in the open air. It was certainly very striking. As the moment of totality approached, the western sky turned of an awful livid purple, the clouds over head assuming a black tint. As the shadow swept over the earth, the eastern sky became obscured, while the western horizon lighted up like the grey dawn of a dull autumn morning. At no time, however, during the totality, was it difficult to see the seconds on the face of a watch. The light was that of a cloudy evening, about an hour after sunset. One curious effect was observed, the apparent contraction or closing in of the celestial vault. Speedily, however, the dawn in the western horizon spread over the heavens; but the sun did not reappear again for at least half an hour after totality. M. Jausen, the French astronomer, who escaped, at the risk of his life, with his instruments in a halloo from Paris, was stationed on a mountain some seven miles from Oran. He can have seen nothing whatever of the phenomenon which he had braved so much to observe."

ELECTRO-MOTIVE FORCE OF METALS IN CONTACT.—E. Edlund in *Poggendorff's Annalen*:—"When an electric current traverses the point of junction of two different metals, a quantity of heat is absorbed or produced per unit of time which is proportional to the strength of the current and to the electromotive force acting between the metals. The author refers on this point to a previous paper; in the present communication he endeavors to estimate the comparative electromotive forces acting between different pairs of metals by the heating or cooling effects of a current of measured strength. The junction formed of each pair to be examined was enclosed in the bulb of an air thermometer, and the difference between the expansions produced when the current passed in opposite directions, was measured. The electromotive order of the metals deduced from the results did not agree with the order given by electroscopic observations but it agreed with the thermo-electric order, though the electromotive forces were not found to be proportional in all cases to the thermo-electromotive forces between the same pairs of metals."

ORIGIN OF GRAPHITE.—Prof. Wagner ascribes it to the decomposition of cyanogen and of the cyanides. The black mass which sometimes separates from hydrocyanic acid, on being washed in nitric acid and dried, is found to consist of scales of graphite. Dr. Wagner infers from this that the artificial graphite that is formed on the cooling of many varieties of iron, has its origin in the same source, namely, cyanogen. It is not the carbon which is held in solution in the melted iron, but the cyanogen compounds, that give rise to the graphite. In the manufacture of soda by Le Blanc's process there is always a quantity of graphite formed, which is derived from the decomposed cyanogen compounds, and in some of the large establishments of Bohemia practical application is made of this incidental product in the manufacture of lead pencils.—*Eng. & M. Journal*.

THE OTHER SIDE OF Eozoön.—Our issue of Jan. 21st contained a paragraph from the communication of T. M. Reade in *Nature*, in regard to the mineral origin of this fossil. Prof. W. B. Carpenter answers Mr. Reade in *Nature* of Jan. 5th. In reference to the point made in the article alluded to, viz.,—that Eozoön has been obtained from metamorphosed rocks only, Prof. C. says that that peculiar structure "is most characteristically displayed in those portions of the serpentine limestone of the Laurentian formation which have undergone the least metamorphic change." The fact that metamorphic rocks have been found with apparently similar structure, does not affect the question of the organic nature of Eozoön. Prof. Carpenter shows that even now, at the deep-sea bottom, the sardonic substance of various organisms is being gradually replaced, as it decomposes, by silicious compounds precipitated from sea-water. We quote: "Dr. Duncan has shown that a like process is taking place at the present time in the case of corals; their animal substance being replaced by silicates, whilst their calcareous skeleton remains unchanged. No mechanical agency can account for this replacement. It is not effected by the percolation of silicates in solution, under the "hydrothermal" action which Mr. Reade (following the lead of Messrs. King and Rowley) invokes as having been concerned in the production of the Canadian Eozoön. And I am justified by the opinion of several of our ablest chemists and mineralogists in the assertion that no agency save a progressive chemical substitution can account for the production of these wonderful models; the silicates being precipitated from sea water by the decomposition of the sardonic substance which they replace and represent. Whether or not this doctrine be accepted, it may be confidently affirmed that whatever be the agency concerned in their production, the filling-up of the cavities of the calcareous skeleton of Eozoön may be fairly accounted for in the same manner."

MAYER ON ELECTRO-MAGNETISM.—Dr. A. M. Mayer has an article in *Silliman's Journal* for September, entitled "Researches in Electro-Magnetism." *Nature* gives of it the following abstract: "The author has devised a very accurate method of determining the relative value of electro-magnets to replace the one usually employed, which consists of measuring the deflection of a magnetic needle which is produced by the action of the electro-magnet. The author found that this process was liable to error in consequence of the difficulty of keeping the current absolutely constant, resulting in a continual motion of the needle. These difficulties were obviated in the following manner: A line eight feet long and divided into fractions of inches was drawn on a table, the latter being so placed that the line was at right to the magnetic meridian; a compass, with a needle nearly six inches long, was placed on this line, and a helix was fixed at each extremity of the line. These helices were traversed by the same current, a tangent galvanometer being placed in the circuit. In this way the needle was influenced by two magnets acting in opposite directions and excited by the same current, and if any deflection of the needle was observed, it must have been due to a difference of power of the magnets. If this occurred the needle might be brought to 0° by moving it from the stronger magnet. A series of experiments was made to determine the variation of the intensity of the force with a change of distance, by placing the needle opposite an electro-magnet and noting the deflection produced when the instruments were at different distances from one another; it was found that in the apparatus employed the intensity varied inversely as the 2.7404 power of the distance from the core. Dr. Mayer has determined the power of cores made of insulated and of non-insulated soft iron wires, and finds that the insulated core is slightly the weaker. He has also measured what thickness of tube is equal to a solid core of the same diameter, and has found that a solid cylinder ten inches long and 1.68 in diameter may be replaced by a tube of the same length and of a thickness of 1-6 of the diameter. This relative size does not appear to be constant for cores of all dimensions. A longitudinal slit in the tube does not diminish its power; in fact, Dr. Mayer seems inclined to think that it facilitates its magnetisation. By placing a helix inside a soft iron tube a magnet is produced with poles the reverse of those of the coil, or of a bar placed within the helix; this supports Ampère's theory of magnetic currents."

CORRESPONDENCE.

Bound East—At Chicago.

[Written for the PRESS.]

Steam Dredges for a Ship Canal.

I have wandered all about this great Chicago, and although I have been frozen by the bitter winds from the lake, yet I have been thawed out again always by the warm hospitality of the people. I propose describing a few places which I have visited.

One of my first calls was at the Vulcan Iron Works, the property of Messrs Atkins & Burgess. Here I saw fine steam engines, cranes, pile drivers, wind mills and dredging machines of every size, power and kind. The works employ 75 to 100 men constantly, and have a high reputation, gained partly by the superior practical ability of Mr. Burgess, and partly by the geniality and evident financial ability of Mr. Atkins. I saw much of interest, but would speak chiefly of the steam dredges which they have built for a canal in Louisiana.

It speaks well for the reputation of the gentlemen, that they should be preferred by a New Orleans company to all their Eastern competitors. It seems that much saving of time and future expense will result, in the opinion of New Orleans merchants, from the building of a short cut from the Mississippi River to Lake Borgne, thence communicating with the Gulf of Mexico. So a ship canal, 160 feet wide and six miles long, is to be made through a Louisiana cypress swamp. The materials to be removed are made up of the deposits of the Mississippi River, firmly held together by the never decaying and never ending roots of the famous cypress.

Messrs. A. and B. are building the dredges for this enterprise, which are well worth describing. On a strong frame of oak and iron are secured two 52-horse power engines. These handle a dipper weighing two tons, with a beam or handle long enough and strong enough to operate in water 25 feet deep. There are four of these frames, each with its two engines and its single ponderous dipper. Each of these with its necessary appliances weighs at least 40 tons. These require the use of two strong boats sufficiently large and capacious to sustain two of these machines with the fuel, etc., requisite to keep the machinery in operation.

How they Operate.

The machinery of these boats is the same with a single exception, and that is in the construction of the dippers. Those of the pioneer boat are armed with cutters, teeth and hooks of steel. This boat is placed where the first work is to be performed. The ponderous dipper is thrust against the bottom by means of one part of the machinery, and then raised by another. The cutters, teeth and hooks cut and tear up roots and timber, and deposit them beyond the banks of the canal. Both dippers are operated at the same time, and thus they excavate, as they advance, the full width of the canal, depositing trees, roots, rocks and earth beyond its banks.

The second boat has plain dippers of the best construction for the removal of earth and mud. It is presumed that the first or pioneer machinery has cleared the canal of all formidable obstacles; the work of the second is to deepen and finish the channel ready for the passage of steamers of every size and kind, or even of national ships of the largest class.

The dredges operate in water from two feet deep to any depth necessary to float a ship. They cut through and remove everything,—roots, earth and boulders weighing tons. Nothing but a solid ledge of rock can stop them.

The cost of the dredges is \$44,000. The workmanship displayed and the talent shown in their construction are of the

highest order. I should think that the projectors of your Stockton Ship Canal might profit by the examination of these engines and their operations in Louisiana.

Reaper and Mower Manufactory.

A very large, and a certainly most important, factory, is that of the McCormick Reaper and Mower Manufacturing Co. The works are extensive and most complete in all respects. I was politely shown through the various departments, and naturally found much of great interest. Over 600 hands are employed, and over *fourteen thousand* reapers and mowers will be put in the market this year.

To Mr. McCormick we are indebted for our present reaping machine, for he was the first to make any improvement on the old time implements. His first patent was granted to him while in Virginia. The talent which enabled him to make this, the most important commencement, has enabled him to make continually additional improvements. These works were started in 1845. They first turned out about a thousand machines yearly. But the excellence and importance of the McCormick Reaper and Mower brought them into use everywhere. They are sent all over the United States and to Europe. The demand is ever on the increase, and now the company find that they must enlarge their works, and they are taking measures for having a capacity of 20,000 to 25,000 machines yearly!

These items attest to the excellence of the machines and the superiority of their workmanship. Of course, I knew of the famous article before I came here, but I did not appreciate at all what an enormous amount of work was done by them every year, until I had gone through this factory.

W. H. M.

An Agricultural Mining District in Montana.

[Written for the PRESS.]

Flint Creek.

EDITORS PRESS:—I presume few of your readers are aware of the location of the Flint Creek silver mines, and indulge the hope that a brief sketch of the locality may not prove uninteresting. They are located upon the west branch of the above creek, about fifteen miles from its source, which is in an intervening spur of the Rocky and Bitter Root mountains, and near the celebrated "Atlantic Cable" gold ledge. The creek running nearly due north through the upper and lower valley of Flint, empties into Hell Gate, about thirty miles west from Deer Lodge City. Leaving the latter place for these mines, the traveler may take either of two roads and reach here in fifty-five miles travel. From about midway in the upper valley and at its broadest part, in a right angle, due east, one mile up amongst the grass-covered hills, the mines are located.

Flint Creek, carrying usually about three thousand inches at this point, passes through the valley within two miles of all the principal locations. Besides this stream, three small branches, have their sources within the district, pass directly through the different quartz locations and empty into Flint. Wood is in great abundance upon each side of the valley, and may be had in any given quantity at a cost of \$3½ per cord. The ores are what are termed sulphurets, or milling ores.

The Mines.

So far, no systematic mining to speak of has been prosecuted, owing to the fact that no opportunity has been offered miners to get a working test of their rock. The only mill here (a small ten-stamp one) was erected some three years since by a St. Louis company, whose practical knowledge of the business or the wants of the camp is limited to this single experiment.

As might have been expected, they instituted a series of costly experiments with

ill-adapted machinery, and after one year's manipulation of mill and mine, they stopped operations. Other adventurous individuals, with as little knowledge practical or theoretical of the business, attempted it and failed. A few weeks since, after a careful examination of the ores, Capt. George Plaisted, formerly of Gold Hill, Storey County, Nev., assumed the management of the company's property (the Hope mine and mill), overhauled the machinery and started up. A lack of quicksilver induced him to commence on second-class ores. The result of the first run from this class of ore proves highly satisfactory both to the management and company. From one hundred and five tons, they cleaned up three hundred and forty-seven pounds of refined bars. The present run, from the appearance of the pans, will exceed the first.

oil and Climate.

Too much can scarcely be said in favor of the soil and climate. Indeed, a rich mining region located in the midst of a rich agricultural district is so seldom met with, that it is worthy of remark. The hills and valleys are covered with a thick growth of rich bunch grass, upon which horses and cattle continue to fatten the year round. The soil produces all vegetables raised in a temperate climate in great abundance, and no finer cereals are grown upon the American Continent. The climate, characteristic of the valleys near the Rocky Mountain range and so little understood, is most healthful and free from moisture and miasmatic influences. The temperature compares favorably with northern Missouri, Indiana, Illinois and Ohio. Observations taken during the month of December, and the unusually cold spell, show conclusively that we are less liable to extreme changes in temperature than any of the above mentioned States. While the temperature was down in most localities below 20 degrees, ours at the lowest point barely reached thirteen degrees.

INDEX.

Philipsburg, M. T., Jan. 20, 1871.

City and Country.

[Written for the PRESS.]

EDITORS PRESS:—A man recently from the East, possessing good business qualifications and some means, inquired of an eminent lawyer in San Francisco what he considered the best business for him to engage in. "Agriculture," replied the lawyer; "it is the safest and most profitable as well as the most healthful vocation, both mentally and physically, in which you can embark." "Yes," he continued, "get a farm and live upon it; get out of the hurry and excitement of the city. Better for yourself, better for your wife, and a thousand times better for your children."

The man remembered the early years of his life upon a farm in Indiana, contrasted them with the later years of anxiety and speculation in New York City, and at once took the advice. He is to-day the owner of a fine farm in one of the most beautiful valleys in the State. It is useless to add that he and his family are prosperous and happy.

How much better it would be for many men and their families who now crowd in the cities, eking out a scanty living upon small salaries, or those who have some petty little business in some basement or narrow cellar, if they would obtain lands while they may be had at government prices, and build homes where they could live as they should. No greater contrast can be drawn than that between a tenement house in a city, reeking with filth and disease, and that of a neat farm cottage in the valleys or foothills of California.

CINCINNATUS.

St. Helena, Jan. 24th.

"NOTES of Travel in San Joaquin County, by L. P. Mc., will be found on another page. It came too late for insertion in its regular place."

THE FIRST RAILROAD.—We have seen about a dozen different accounts of the "first" railroad ever built in the United States, and the first locomotive. We used to think that we knew which these were, but there have been so many of the kind, if the eastern papers are all to be believed, that now we feel obliged to "give it up." Here is the latest "first road," from the *Harrisburg State Journal*.—It is generally supposed that the Tramway railroad from Quincy granite quarries to Boston, was the first railway in America; Delaware county antedates this effort by twenty years. The tramway at Leiper's stone quarry, in that county, was constructed in 1806, and that in the Quincy quarries in 1826. The first railroad, however, that approximated in mode of construction to those now in use, was that laid down from Minch Chunk to the mines of the Lehigh coal and navigation company in 1827. In 1837, the Legislature passed a bill authorizing the Lehigh company to connect the navigation on the Lehigh with the canal on the Susquehanna at Wilkesbarre by a railroad. Under this act the Lehigh and Susquehanna railroad was completed in 1843, and in 1867 it was extended down the Lehigh to Easton. In this same wonderful and marvelously rich valley, and historically, one of the most interesting parts of the State, is the Lehigh Valley railroad, begun in 1850 and completed in 1856, mainly through the effort of Asa Packer. By the consolidation of several interior lines, this company now affords a continuous route through the Lehigh coal region to N. Y. state line. As early, therefore, as 1840, Pennsylvania had a total length of 1,280 miles of canal, of which 433 miles were owned by private corporations, and 795 miles of rail, 118 miles were owned by the commonwealth.

THAT FIRST LOCOMOTIVE.—Here is another first locomotive, according to the *Albany (Pa.) Chronicle*: The first locomotive that ever did service in the United States, is now lying outside of a foundry at Carbondale, Luzerne County. It ought to be preserved somewhere as an interesting relic of the early days of railroading. The first locomotive engine introduced and worked in America, was run upon the Delaware and Hudson Railroad, in the year 1828, and Hone's Dale offered its friendly glen for the purpose of conducting the experiment. This locomotive, called the "Stourbridge Lion," was built in England, of the best workmanship and material, and most approved pattern of that date. The road passed out of Honesdale by a sharp northwesterly curve, with a moderate grade, and was carried over the Lackawaxen by a long hemlock trestling, considered too frail by many to support the great weight of the mysterious looking engine all ready for the hazardous journey.

As the crowd gathered from far and near, expecting that bridge, locomotive and all, would plunge into the stream the moment the passage was attempted, no one dared to run the locomotive across the chasm but Major Horatio Allen, who, amid exultation and praise, passed over the bridge and a portion of the road in safety. The engine, however, was abandoned, as the slender trestling forming much of the body of the road, sufficiently strong for ordinary cars, was found too feeble for the "weight and wear." Major Allen, in the account of this first trip of a locomotive on this continent, says: "As I placed my hand on the throttle, I was undecided whether I would move slowly or with a fair degree of speed; but, believing that the road would prove safe, and preferring, if we did go down, to go down handsomely and without any evidence of timidity, I started with considerable velocity, passed the curve over the creek safely, and was soon out of hearing of the vast assemblage. At the end of two or three miles I reversed the valve and returned without accident, having thus made the first railroad trip by locomotive ever made on the western hemisphere."

RETURN OF THE SHIP PROSPECTORS.—On Tuesday evening last, says the *San Bernardino Guardian* of the 14th, Charley Clusker and party returned to town, we are sorry to say, unsuccessful. Their animals were completely worn out—scarcely being able to bring the wagon home. The indomitable Charley is not discouraged, and will make another effort to find the ship, this time via Dos Palmas. He deserves success, and if the ship is there, of which he entertains no doubt, he will eventually find it. We wish him success.

THE Princess of Prussia makes her own dresses and bonnets.

MINING SUMMARY.

The following information is gleaned mostly from journals published in the interior, in close proximity to the mines mentioned.

California.

ALPINE COUNTY.

SCHENECTADY.—*Miner*, Jan. 21st: At this mine large quantities of soft ore are being taken out, and considerable hard ore. Of this latter only so much is broken as is necessary in following up the pockets which contain the rich sack ore.

GLOBE.—Mr. Ambler, the Supt., informs us that this company now have ample funds in hand to finish the works, and that he is authorized to push matters. Mr. A. seems to feel certain of a satisfactory result from the Globe ores in the mill now being built.

AMADOR COUNTY.

THE SITUATION.—*Dispatch*, Jan. 28th. The mining interests of Amador have not been for years in a more prosperous state. All the mines and mills in operation are yielding large profits. Placer mining, systematically prosecuted, continues to pay well. The rains have given new hope for the season. The extension of the Butte ditch will be completed within a few days. This work will open up a large amount of mining ground hitherto unavailable for want of water. The Kennedy mill will commence operations immediately after the water is turned on.

KENNEDY.—This mine is developing into one of the richest in California. The main working is now at a depth of 500 feet, where the vein is five feet. It is turning out rock that will yield more than \$1,000 per ton. There are thousands of tons of this uncovered. The mine will be operated with all the force that can be employed, as soon as the mill can be started—which will be some time next week.

VOLCANO.—*Cor.* of same: "The Markley mine is four or five miles from Volcano. About two years ago operations were commenced, and a depth of 280 feet has been reached. At the surface the main chimney is two feet thick and sixty feet long; at the 200-foot level, four feet thick and 280 feet long. From rock taken out of the 200-foot level, they obtained \$14,000, after which, in four weeks, they "stopped out" rock, from which they obtained \$8,000. Last fall they sank 80 feet, and put up steam hoisting works of 15-horse power. The company recently started up their twelve stamps, 350 pounds each, with which they pounded out \$1,500 per week, and run ten hours per day. Nichales & Markley are largely interested in a mine recently discovered near Fort Ann, one mile southwest of the Markley, from which they are taking rock which prospects \$75 per ton on an average. They are down 25 feet and have a paying ledge 2½ feet wide.

CALAVERAS COUNTY.

MINING.—*Chronicle*, Jan. 28th: Since the rains, all the mills in this vicinity have resumed active operations, and gravel mining is progressing under the impetus of a full head of water.

EL DORADO COUNTY.

CLARKSVILLE.—*Cor.* of Placerville Democrat, Jan. 28th: The mines in the vicinity are being extensively worked; more this year than at any previous time for five or six years. There is good ground here, and few of the ravines but will pay ordinary wages. There is one place in which a gentleman has just taken three dollars at a pan. There has been pipe laid for a hydraulic on the north side of the hill, and they are playing away in a lively manner.

INYO COUNTY.

MOUNT HOPE MINE.—*Independent*, Jan. 21st: This mine is one mile east of the Chrysopolis mill. Capt. Chase is driving a tunnel, which is now in 50 feet, and in 30 or 40 feet further expects to strike the ledge at a depth of 150 feet.

ECLIPSE.—We hear of extensive changes on the part of the Eclipse Co., among the rest, the cutting of a ditch to supply water from the river as a motive power.

LASSEN COUNTY.

THE MINES.—*Sage Brush*, Jan. 14th: Messrs. Neale & Goldstein returned from the new mines this week. They bring still more flattering news. Ore 25 feet below the surface prospects fabulously rich in gold and silver.

PLACER COUNTY.

GRAVES-PUTNAM.—*Herald*, Jan. 28th: The mill of this Co. on Baltimore ravine is completed and has been running for eight or nine days, part of the time with a light head of water and only four stamps. In a day or two more the owners will make the first clean up. The mill will crush from ten to fourteen tons per day, and the ledge

as now opened can easily keep it in constant operation with the ore now out—some 500 tons.

RISING SUN.—We are informed that this mine has a better prospect than at any previous time. The workmen have reached, at the 300-foot level, a larger and richer ledge of ore, the ledge being two feet thick. This Co. has spent \$90,000, and has brought to the surface something over \$30,000.

PLUMAS COUNTY.

DEADWOOD.—*Quincy National*, Jan. 21st: The Deadwood claim on Emigrant Hill continues to "pan." We have no figures for this week's work, but are informed that the hoys are taking out very rich dirt, and getting plenty of coarse gold.

SIERRA COUNTY.

ITEMS.—*Messenger*, Jan. 28th: We learn that in all probability the Keystone will soon open.... Our mines are receiving attention from capitalists.... The old Caledonian Co., at Cedar Grove, are taking out pretty good pay.

RAIN.—*Democrat*, Jan. 26th: Present indications are favorable for a water season yet. The weather is warm. The rain commenced falling on Sunday. From the appearance of the river on Monday, we judge it rained higher up in the mountains. This is just what we want at this time to start the water in the ditches, which were blocked up with snow.

PRIMROSE MINE.—This has been sold to Messrs. Silverman & Falk, both of Chicago. The sale was private. The Primrose has paid well to its former owners, but owing to bad management it became insolvent. No longer ago than three years, Mr. Lamping was offered \$100,000 in gold coin for the mine, and since that time \$150,000 improvements have been added. Ross Browne, the United States geologist, makes the Primrose second to none in richness.

SISKIYOU COUNTY.

ROUGH AND READY.—*Yreka Journal*, Jan. 25th: The Etna Mining Co. is steadily working their claim near Etna Mills, with a powerful hydraulic, supplied from Etna Creek, and have found good prospects.

NEVADA COUNTY.

BLOOMFIELD.—*Transcript*, Jan. 27th: R. C. Black has fitted up his claims on the east bank of Humboldt Creek, and has commenced washing, using water from the Eureka Lake ditch, employing six hands. A. G. Dennett has fitted up his claims on the east side of Colorado Hill. He has put in a new three foot flume, also a new flume and bulkhead, from which a string of 15 and 11 inch iron pipe, 600 feet in length, leads the water to a monitor of Craig's patent, having a capacity of throwing 200 to 600 inches. Brockmeyer and Haner, who own adjoining claims on the north side of the same mill, have consolidated, and are refitting the lower set. These claims, as those of Dennett have been idle five or six years, owing to high price of water and the want of sufficient pressure through the old fashioned hydraulic pipes. The N. B. G. M. Co. have had to suspend operations on their shaft at the Malakoff, for repairs. The gravel keeps up its character for richness. They employ 40 men.

STRUCK IT.—Same of 29th: On Friday a rich strike was made in Stiles' mine, at the outlet of Lost Hill Ravine. A cross cut was run at the end of the tunnel, and a ledge struck, which the men worked across a distance of three feet, and had not cut through. The ore shows gold all through. This was the ledge upon which Stiles put up hoisting works.

CEMENT HILL.—The Gravel Co. have their appliances all completed, and yesterday, for the first time, turned in a head of water to see if everything was in working order. The Co. commence regular washing Monday.

ERIE MINE.—*Gazette*, Jan. 25th: The Erie, or the Jim Crack mine, three and a half miles south of Eureka, is most promising. The owners have leased the mill and mine for two years to Veatch & McCurdy. The ledge averages ten feet, the whole of which yields \$15 a ton. The mine is explored to the depth of one hundred and twenty feet, with a side drift of two hundred and twenty feet. The amount of rock that could be raised daily if there were means to crush it, is immense. The present ten stamp mill is run day and night. The lessees have been offered \$30,000 if they would give up the lease to the owners.

BLACK & IRWIN.—This mine, near Eureka, is being vigorously worked. The ten stamp steam mill is run night and day, and the rock pays good dividends.

SPECIMENS.—*Grass Valley Union*, Jan. 29th: Yesterday a lot of fine specimens

came up out of the Eureka mine, which in a few minutes showed contents to the value of \$1,000.

THE RAIN.—The *Union* of 26th says: We understand that the Greenhorn mill commenced crushing yesterday, water having been supplied by the last storm. On Randolph Ridge several claims have commenced.

The *Gazette* of 28th says there is a fair prospect that the rain will continue until there is water enough for hydraulic mining.

The *Transcript* of 29th gives the total rainfall for the season, so far, as 24.54 inches. At this time last year it was 27.35.

PENNSYLVANIA.—*Transcript*, Jan. 31st: This mine is being opened to a new level and is looking first rate. We understand that the yield has been sufficient to pay all expenses of sinking.

NEW MILL.—Groves and Hoagland are to put up a mill near Emigrant Gap. They have a six foot ledge on which they have sunk 25 feet, and some rock crushed at Colfax yielded \$100 per ton.

TRINITY COUNTY.

THE PROSPECTS.—*Journal*, Jan. 28th: Already the season is too far advanced to be a good one, but hopes are still entertained that there will be storm enough to enable our miners to make an average. We are not very certain of this. There is no snow on the mountains. We believe that most of our miners will be satisfied if they get enough work done to pay expenses.

REPAIRED.—The big flume having broken down, some of the Canyon Creek miners have been short of water. It is now nearly replaced.

Nevada.

ELY DISTRICT.

MEADOW VALLEY CO.—*Record*, Jan. 19: We made a trip to the mine on Tuesday. In the old shaft we found a 5-foot vein, from which a large amount of ore is being extracted. At No. 7, the recent purchase on the 200-foot level we found an eight-foot vein of ore that will certainly work \$200 to \$250 per ton.

WASHINGTON MINE.—Same of 22d: We visited the Washington claim, owned by the Pioche Co., on Friday. The timbering of the shaft to the depth of 120 feet is a fine piece of workmanship. Ventilation is made perfect by communication with the old shaft. The ledge is 5 to 6 feet wide, and a good vein of ore is shown throughout.

COLLEEN BAWN.—Some rock obtained from this mine at the depth of 14 feet, assayed \$250 per ton.

BULLION.—The shipments for the week ending January 20th, through Wells, Fargo & Co. are: to the East, \$59,010.39; to the West, \$4,700, making together \$63,710.39.

BULLION.—*Record*, Jan. 26th: The Meadow Valley Co. shipped during the week ending January 21st, bullion amounting to \$51,253.31. The Raymond & Ely Co. shipped \$13,146.07. Morgan Courtney, Flood and others, shipped 5 bars valued at \$8,941. One bar was shipped by Felsenath valued at \$1,122 and one by Barnum W. Field valued at \$1,000, making a total \$75,462.38.

CREOLE.—We were shown on Monday 3 bars worth \$6,000, the product of ore from the Creole claim worked by Raymond & Bro.'s 5-stamp mill, Elyville.

ESMERALDA.

AURORA.—*Cor.* of *Inyo Independent*, Jan. 21st: The old mines of Columbus district are turning out large quantities of chloride ores of fabulous richness, while some new discoveries, give evidence of being rich. Messrs. Sweetapple and Hazel intend to erect a mill soon. Work has been suspended at the Silver Peak mine and mill for some time, but I am informed that operations will be resumed about the 1st of May. At Pine Grove, the yield of the mines is about \$10,000 per week, chiefly gold bullion. Rockland, four miles south, is beginning to be a camp of great importance. One of the best mines in the State—"the Dolores"—is situated there, and rumor hath it that Mr. Sylvester Kean, who is the principal owner, has sold one thousand feet to Pope & Talbot, of San Francisco, for a large sum of money. There is one mill running steadily at Rockland, and another will be built in the spring.

HUMBOLDT.

SHUT DOWN.—Silver State, Jan. 21st: The Butte mill, after an eight days' run, shut down on Wednesday for the want of water. Enough was shown in that eight days, to satisfy all that the new desulphurizing furnace is a complete success.

THE SHEBA.—All who have examined this mine within the last few days, concur in the opinion that a fine vein of quartz and

mineral has been found—a regular well defined lode.

BULLION.—The amount shipped from the Arizona mine, through Wells, Fargo & Co., since our last issue was 594 pounds, valued at \$7,876.

GOLD RUN DISTRICT.—*Reg.*, Jan. 28th: On the First South Extension of the Golconda we find Ed. Lovejoy sinking a shaft on the ledge which is two feet thick, fifteen feet from the surface. Several tons of ore is piled upon the dump, the richest of which he intends to have worked at the Rye Patch mill. On the Second South Extension, L. D. Wehh has eight men extracting ore and running levels. The main shaft is down 50 feet. The ledge will average two feet. The ore is assorted on the dump, the richest sacked for shipment to Rye Patch. Mr. Wehh has rented the Golconda mill for the purpose of reducing his second class ores. The Cumberland claim is now principally owned by Carter & Hasson. A shaft 50 feet has been sunk. The ore is of good quality and all taken from the shaft has been shipped. A large quantity of argentiferous galena, lies on the dump. Work suspended, cause impetuosity of the owners. South of the Cumberland is the Register, on which a drift shows a vein of ore three feet in thickness. Work is also suspended on this mine.

RAILROAD DISTRICT.—*Elko Independent*, Jan. 28th:—Work has been done on several mines within the last three months, proving them rich. Last Chance and Shoo-Fly, have been worked the most extensively. They are owned by E. V. Robbins, and we learn through him that the shaft in the Last Chance is down sixty feet, with a vein of good ore all the way, and the ledge twenty-two feet wide. Work has been suspended for a few weeks. From twenty-one assays, the average was \$132, the largest being \$911 51. Shoo-Fly is in a vein five feet in width of very rich carbonate ore, five assays showing an average of \$203 per ton, one of this five being a select specimen, which assayed \$395 83. There are one hundred tons on the dump, and two men are taking out three to five tons per day. A wire cable twelve hundred feet in length is being worked, and six to eight tons of ore per day let down into the canyon below.

WASHOE.

YELLOW JACKET.—*Enterprise*, Jan. 29th: Beyond the completion of an air-connection by means of a winze from the 900-foot to the 1,000-foot level, we learn of nothing new. The ore product, which has been 170 tons per day, will now be greatly increased by reason of this. The ore yields now \$38 per ton.

CHOLLAR-POTOSI.—This mine yielded 1,690 tons of ore during the past week, assaying \$75 per ton. In the Blue Wing section there has been some improvement. Some fine ore has been met with, which gives promise of extending to the surface.

SAVAGE.—About the usual amount of ore is extracted. The ore does not appear to improve on the 600-foot level. There is still a large amount coming from the 535-foot level, but it is not of high grade. The mine is yielding 200 tons of ore per day.

HALE & NORCROSS.—This is looking well throughout. The ore shipments are fully up to those of last week and the assays from some sections show a decided improvement.

CROWN POINT.—The ore deposit on the 1,100-foot level improves as it is followed upward, but in the winze it is of low grade and becomes poorer down. The drift on the 1,000-foot level is near the ore body. The yield remains about the same.

OVERMAN.—On the 600-foot level, north, they are making a raise in quartz, as yet not found to carry metal. The 226-foot level is yielding eighty tons per day, while some ten tons are taken from the 400-foot level.

SIERRA NEVADA.—The mine is yielding the usual ore, and the mill is in constant operation. The company is also sending ore to the Berry & Evans mill. The Sacramento mill will start up on Sierra Nevada ore about the 5th of February.

SEGREGATED BELCHER.—A few miners are drifting east for the ore body supposed to exist, but no ore is being raised at present. There are several thousand tons on the dump waiting for the starting of the mill on Carson River.

OPHIR.—In the "up-rise" from the south drift promising quartz has been met with, but as yet no paying ore. Some work has been done in the north drift.

VIRGINIA CONSOLIDATED.—Good progress is being made in the drift to the northwest from the main shaft.

GOULD & CURRY.—About the usual amount of ore taken, and the assays from car samples show \$35 to \$38 per ton.

CHEMICAL REDUCTION.—By several of the best known methods.

INDUSTRIAL MISCELLANY.

COTTON CULTURE IN CALIFORNIA. No. 2.

[Written for the Press.]

BY JOHN L. STRONG.

When the work of planting is concluded, there comes an interval of five to ten days during which the germination of the plant takes place. This interval will be devoted by the farmer to the satisfaction of the numerous demands which a well regulated system of cultivation will make upon his attention. As soon as the young cotton is up to a good stand, and the third and fourth leaves begin to appear, the working may commence.

The ground must be kept loose and mellow for two reasons. 1st. That the moisture may rise to the surface. 2nd. That the tap-root, now making its way downward, may not be obstructed. For this purpose, a light cultivator should be run through the rows, each way, throwing a little light earth to the plant. By this operation, also, all weeds or grass that may have sprung up in the interval between the planting and coming up of the cotton, will be destroyed.

The first cultivating should be followed by the hoe. Any grass or weeds that may have been left by the cultivator, must be destroyed, and the plants reduced to a stand. In the judgment of the writer, from two to three stalks should be left in each check; the number to be graduated by the character of the soil. The thinning should be done by hand, and the thrickest and healthiest plants left.

The hoe hands will carry a small sack full of seed, suspended from the neck by a string, and from this sack carefully replant all hills or checks where the seed has failed to come up. After this work is finished, the cultivator should be again passed through the rows, each way, keeping the soil about the plant loose, to allow a full circulation of atmospheric air to the fibrous roots, which are now shooting out in every direction from the main or tap-root, in search of nourishment, and to furnish also a free mellow soil for their rapid and perfect development. Care should be exercised that these fibrous roots are left unbroken by the plow, to avoid which, it should not approach the plants nearer than six inches on either side. If any grass or weeds should be left on the spaces thus remaining untouched around the plants, it must be removed by the hoes, which will follow for this purpose and also to reduce the replanted cotton to a stand. The hoe hands will carefully shave off the grass from the spaces, not dig it, as the digging will either break or expose the fibrous roots, deprive the plant of one of the principal sources of its nourishment, and result in a loss of its fruit during that season when its demands upon culture, soil and atmosphere are greatest.

It is the opinion of the writer that the system herein indicated will insure a full yield. It involves thorough preparation and careful cultivation—treatment which invariably resulted in remunerative returns to the planters of the Cotton States—but which, in the present disorganized and demoralized condition of the labor system, he cannot adopt. Under the influence of the pernicious system of "shares," by which alone he can obtain labor to cultivate his fields, every effort toward progress and improvement is fettered, and he finds himself under the necessity of substituting ignorant and primitive ideas for his own intelligent direction. He thus witnesses a

ruthless butchery of the cotton plant under the old "grass killing" process, and the constant exhaustion of the soil by chancelless and artless culture. Add to this his subjection to all the vicissitudes of uncertain seasons and fluctuations in price, and the manifest advantages which we enjoy will present to us sufficient causes for present gratulation and future hopes.

Each mail covers the table of the writer with disheartening lamentations from his Southern friends over present prospects and future anticipations. Their fields are white with ungathered cotton, the snows and freezings of a winter of unprecedented coldness are beating it into the earth and destroying it, and the "share-holder" is idle. Under the highest average yield of the war, the cost of production exceeds the price received, and longing eyes are turned to California, earnestly watching the efforts of the writer and eagerly awaiting the results of those efforts, made at one-half the expense that attend their own. In the next paper contributed to the Press the promise of his efforts will be stated.

THE McCORMICK REAPER AND MOWER.

On another page will be found an interesting letter from W. H. M., who sends us

THE McCORMICK "RELIABLE" REAPER AND MOWER.

an account of the celebrated manufactory of the McCormick Reaper and Mower Manufacturing Company, at Chicago. In connection with this, we give an engraving of one of the machines turned out by that company, the one which they term the "Reliable."

In no other matter has our American inventive talent been turned to better account or followed by more important results, than in the improvement of agricultural implements. The farmer is indispensable to the welfare, to the existence even, of the country. It is therefore particularly necessary that his tools should be of the best kind. In our land of broad acres and extensive farms, it is necessary to have machines which will work with rapidity, that large crops may be grown and harvested. Much credit is then due to the man who invents improved devices for the farmer; and perhaps of all inventors of the kind, no one deserves more praise than Mr. McCormick, the Pioneer of reapers and mowers.

We shall be enabled to give illustrations of one or two other inventions of the kind as devised by this gentleman; and thereby, we think, we shall be acting in the interest of our readers; for here, if anywhere, such machines are particularly valuable.

A little sound knowledge, with a great deal of care, goes further on a farm than great knowledge half applied.

Sweden still sticks to the velocipede, and several factories are busy all the time,

SALT MAKING IN ALAMEDA.

The *Overland Monthly* for February shows undiminished excellence. It contains the usual miscellany of good stories, poetry and interesting articles. The corps of contributors is enlarged by the addition of several good writers, and the matter is as interesting as ever. We can well be proud of the existence of such a magazine, filled with contributions of Pacific Coast talent, devoted to and ably supporting the Pacific Coast interests,—one which we can justly claim to be peculiarly *ours*,—and yet inferior to no journal in the whole country. The last statement is sufficiently well proved by its extensive circulation at the East. We take from its columns the following extract concerning the salt works at Alameda:—

In the salt works of Mr. Quigley, three ponds are used. These ponds are situated in close proximity, and contain each about the same superficies, or eight acres. The outer pond, and the one that communicates with the tide-water directly, holds the salt water in deposit, to be carried into the intermediate, or "pickle-pond," as it may be needed, and is generally less shallow than the other two. The water here is of a dull, leaden color, with nothing to relieve its

GRAPE CULTURE IN THE FOOT HILLS.

Some one has furnished the *Hearth and Home* the following figures showing the profits of grape culture in the foot-hills of this state:—

The cost of cultivation and net profits this year of a small vineyard of less than four acres in El Dorado county, are hereto annexed, the figures given being furnished by the owner himself:

Thirty days' pruning in Jan. and Feb.....	\$60 00
Cultivating, men and horse 8 days.....	24 00
Hoeing, 4 days.....	8 00
Picking, 15 days.....	30 00

Total expenses.....\$122 00

Nineteen tons of grapes—four and three-quarter tons per acre—were, without irrigation, gathered from the above small patch of ground, and that was a small yield. The grapes were sold for \$20 per ton, or a total of \$380. Deducting the expenses of cultivation from the gross receipts, leaves a net return of \$258, or \$64 per acre.

The only reason, remarks the *Marysville Appeal*, why grape culture has not proved profitable in many remote places has been in the want of a market for the grapes or wine. All through the northern counties grapes grow abundantly, but the expense of transporting them to market is so great that it has prevented people from planting vines, except to provide grapes for their own use or local consumption.

If the grape growers would unite in establishing wine-making companies with proper cellars, etc., or in any way procure their establishment at accessible points, they would thereby provide abundant and convenient markets for their surplus grapes at highly remunerative prices—say \$20 per ton. Several such establishments are already in existence and others are in contemplation, which, as soon as in operation, will become centers of grape-growing districts, and lead to the rapid development of an important industry.

The writer in the *Hearth and Home*, from whom we have already quoted, says further:—"In ten years hence, certainly, and in five probably, an average vineyard and orchard in the foothills will sell for more, acre for acre, than wheat land in our valleys, for which from \$30 to \$60 per acre is now asked.

We believe that his prognostications are correct, and that the dwellers in the foothills will soon awake to a realization of the situation and profit by it.

WOOD AND WATER.—There is talk, in some of the Western States, of asking Congress, if State statutes are not to be procured, to pass a law for the protection of the forests growing by the large streams of the country, at least at their sources. The ground for such a movement is, that our annual spring freshets, which are so destructive in their effects, would thereby be greatly, if not entirely, prevented.

SINGULAR CIRCUMSTANCE.—A man by the name of Moran recently murdered Minot C. Packard, of Stoughton, Mass. When the grand jury, before whom Moran's case was to be presented, was drawn, the first name taken from the jury box was that of his victim.

MULBERRY TREES.—The *Sacramento Bee* of Jan. 23d, states that I. N. Hoag had that day forwarded to a party at Lincoln, Placer county, 2,300 mulberry trees grown in his nursery across the river. Large quantities of these trees are almost daily sent by him to the interior, indicating that silk culture is rapidly on the increase.

SWAMP LANDS.—Oregon has 2,000,000 acres of swamp lands and California about 3,300,000.

POPULAR LECTURES.

Vaporization and Elastic Force of Steam.

[Prof. JOHN LECONTE before the MECHANIC ARTS COLLEGE, Mechanics' Institute Hall, S. F. Reported expressly for the PRESS.]

What Boiling and Simmering are.

LECT. III. Jan. 28. We have before considered, said the professor, the formation of vapors at temperatures below the boiling point. We have seen that the vapors form at the surface of the liquid and that their elastic force increases with the temperature. At the boiling point, however, new phenomena present themselves. No matter how we may increase the heat applied, we can get no augmentation of temperature in the liquid. In the case of water, we cannot get the thermometer to rise above 212°. Beyond this point, the heat all disappears, or rather, it is used up in changing the state of the liquid, in the rapid formation of vapor.

The ebullition or boiling is caused by bubbles of vapor forming in the body of the liquid and rising up through the liquid without being condensed. It is necessary for this action that the elasticity of the vapor formed should be sufficient to overcome all the forces striving to restrain that elasticity. One of these forces is the cohesion of the particles of the liquid; this is different in different liquids. Another is the pressure of the superincumbent liquid; another is the pressure of the atmosphere on the surface of the liquid.

Boiling is not the passage through the liquid of bubbles of heated air, as is very commonly supposed, for this would require an indefinite supply of air in the liquid, but of vapor, as already remarked. The *simmering* which precedes boiling is really a phenomenon of the same character. When heat is applied, the water (or other liquid) below becomes warm and rises, while cold water takes its place. If we heat slowly, this circulation continues and gradually the whole is heated to the boiling point without any simmering. But if we heat rapidly, this circulation cannot take place rapidly enough, and steam is formed below and rises into the upper part of the liquid which is not yet hot enough, however, to enable the steam to pass through it uncondensed. Therefore the steam bubbles collapse, and this is what we call *simmering*. When the boiling point is reached, the vapors are no longer thus condensed, do not collapse.

We find that each liquid boils at a fixed temperature under the same circumstances; that the temperature remains constant during the whole process; and that the liquid expands and takes up a much larger space in changing to vapor.

Circumstances which influence boiling are: 1. The depth from the surface of the liquid; the pressure of the superincumbent column makes a great difference. 2. The pressure on the surface of the liquid. 3. Substances in solution, as salts, etc. 4. The state of cohesion of the particles to the inclosing vessel, or to one another.

We can Lower the Boiling Point.

We can reduce the boiling point indefinitely. Thus, if we put water under a vacuum (by means of an air-pump), by thus reducing the pressure on it, we can get it to *boil* at 100° (Fah.) or 60°, or even (if we remove the vapor formed, by proper apparatus) *when on the point of freezing*. We can show this by a simple, and rather curious, experiment. We fill a glass flask partly full of water, which we boil until all air is driven out of the flask. We cork the flask up tightly and invert it in a stand, in such a manner that the neck dips into a vessel filled with water. Now there is no pressure on the liquid in the flask except that of the water vapor. If then we pour cold water on the flask, the water in it commences to boil, while by pouring hot water on it, this boiling can be stopped. The reason is that the cold water cools and condenses the vapor and therefore diminishes the pressure on the liquid.

As removing or lessening the pressure of the air on the surface of the liquid lowers the boiling point, we find that this boiling temperature is the lower, the higher up we ascend. The following table illustrates this, giving the boiling point of water at several elevated points.

	Elevation.	Boiling Temp.
Mt. Blanc.....	15,780 feet	184.95° Fah.
Andiana (South America) 13,455 "		187.30 "
Quito.....	9,541 "	194.20 "
City of Mexico.....	7,471 "	198.10 "
Sea Level.....	0 "	212.00 "
Dead Sea.....	-1,317 "	214.44 "

Effect on Cooking—Heights measured by the Boiling Points.

In consequence of this, combined with the fact that the cooking power is increased by an increase of the boiling point, but decreased by the decrease thereof, people in elevated regions find it difficult to cook their food. Thus, at Antisana, potatoes may be boiled for hours without being made eatable. Under such circumstances people are obliged to have recourse to artificial means to raise the boiling point. For certain substances, as the starch of potatoes, etc., a certain high temperature is required to cook them, and if the boiling point is below that temperature, boiling will not cook them.

The relation of elevation to boiling point has led to propositions to determine the height of places by the boiling temperature, if one has no better way. But this is a very imperfect method, and one which cannot be relied on. Formulas have been given for this object. Forbes gave this: $H = 543.2 \times (212^\circ - t)$, t being the boiling temperature at the place. Tyndall gives it: $H = 590 \times (212^\circ - t)$. Now if we apply this to Mt. Blanc, where the boiling temperature is 184.95°, we should have the height, according to Forbes' formula, $H = 513.2 (212 - 184.95) = 14,696$ feet; or, according to Tyndall, $H = 590 (212 - 184.95) = 15,959$ feet, while in reality, it is 15,780 feet, as given above.

This shows the inaccuracy of the method. Moreover, the thermometer used must be very delicate, for a mistake of one-tenth of a degree gives an error of 60 feet! Again, the barometer is subject to fluctuations at any one place. Thus, at Paris, it has been found to stand at 761 m.m., and at 719 m.m. The boiling temperature for the first point is 213.41° Fah., for the second, 209.30°. Difference, 4.11°. Reckoning by Tyndall's formula, we have the difference in height $(H = 590 \times 4.11) = 2,443$ feet; that is, the height of Paris has fluctuated 2,443 feet; while, of course it has in reality remained the same. By this method, a traveler found that the source of the Amazon was several hundred feet below the mouth.

We can raise the Boiling Point.

By increasing the pressure, we can raise the boiling point. This is an important fact, for by it we are enabled to dissolve many substances usually considered insoluble. If, for example, we suspend fragments of glass in the boiler of a steam engine, for some time, we find that they have assumed the shape of drops, showing that they have been dissolved to a certain extent. It is important in a geological point of view, indicating that many minerals may be thus dissolved in the interior of the earth by the waters percolating there. And as a small amount of alkali, dissolved in the water, augments its solvent power, this becomes a point of very considerable geological interest.

Papins "digestor" was merely a kettle arranged with a valve to increase the boiling point, by increasing the pressure, so that in it bones can be dissolved in hot water. The common "soup-digestor" is a similar arrangement, by which we can dissolve not only the juices of meat, but also the gristle, etc.

By dissolving salts in water, we can raise the boiling point. This may possibly result from the cohesive force of the particles being increased thereby. By adding chloride of calcium, the boiling point of water has been raised to 335° Fah., for example. In support of the explanation just given, we may remark that it has been found that washing the interior of a vessel with sulphuric acid increases the boiling point of water heated in this vessel, by increasing the cohesion of the water particles to the sides of the vessel. By adding the acid, the boiling point can be raised very considerably, but when the liquid commences to boil, it does so with great violence, incurring danger of breaking the vessel. For the heat hitherto imprisoned makes steam with great force. Then the temperature sinks to and remains at 212°.

The presence of air in water promotes boiling and its absence retards it. We may perhaps compare the particles of air intermingled with the particles of water to elastic cushions, which serve to act against the cohesive forces; but when these cushions are removed, greater force is necessary to overcome the latter. By removing the air, water has been raised to a temperature of 300° without boiling. But when it does commence to boil, as in the last case, it does so with explosive force, and the temperature falls to 212°.

Boiler Explosions.

Very possibly some of the mysterious cases of boiler explosions may be due to this cause. For example, a river steamer goes along quietly until it comes to a stop at a landing; then the pumps stop and the water in the boiler becomes quiet, and very probably the temperature increases until it may be above the boiling point.

Nothing occurs until the steamer starts again, when the pumps commence working, water holding air is injected into the boiler, and an explosion follows. This would explain why a certain class of explosions occurs when an engine starts.

Faraday has experimented on this subject. In order to get the water as free from air as possible—and to get it perfectly free is very difficult—he took solid ice, which holds but very little air, and melted it under oil. He, too, raised the water to 300° without boiling.

Dufour went still further. He found that there were other conditions under which the boiling point could be raised. This he did by heating liquids which were not in contact with any solid. Thus, he made an oily mixture of the same specific gravity as water, but with a higher boiling point, and put a drop of water into it. The drop remained suspended in the oily mass, and by heating the oil, he could get the water above its boiling point without boiling. A drop, one or two millimeters in diameter, could be heated thus to 350°. This corresponds to a force, retaining the water in the spherical shape (which it assumes) of 120 lbs. per square inch. He concluded that its remaining without boiling was due to the elastic film which holds it in shape. As soon as the drop is touched by a solid body, as a glass rod, it boils with violence. This experiment can be repeated with other substances; as, for instance, with chloroform in a concentrated solution of chloride of zinc.

The Spheroidal State—What it is.

This phenomenon has been observed from time immemorial, by ordinary persons. Blacksmiths have often witnessed its occurrence, for when they throw water on a hot fire, many of the drops dance about quite a time without evaporating; and laundresses test the heat of their flat-irons by it, for if the saliva simply evaporates they know the iron is not as hot as when it dances about in a globule.

But nothing resulted from these observations until the attention of scientific men was attracted, in 1756; and in 1842 the matter was scientifically investigated. Boutigny investigated the matter with great care, and arrived at important results.

We heat a metallic plate or dish (of silver, copper or platinum) to a red heat over a spirit lamp, and then put a few drops of water on the plate. The liquid assumes a globular shape, often has a roscate hue, and rotates rapidly, without boiling or decreasing perceptibly in size. When the plate is kept very hot, we can gradually add quite a large amount of water without its boiling. If one lets the plate cool, the water begins suddenly to boil with great violence.

Experiments have established the following: 1. The temperature of the plate is above the boiling temperature of the liquid.

2. The temperature of the liquid spheroid is below its boiling temperature. This we can determine directly, when we have quite a large amount of the liquid, by inserting a thermometer in it.

3. The temperature of the vapor is nearly equal to the temperature of the plate.

4. Evaporation is less rapid than at the boiling point.

5. The spheroid is not in contact with the hot plate. This we can easily see on looking closely. Between the liquid and the plate is vapor, superheated steam, referred to under 3.

6. The surface of the spheroid is bright and silvery.

The following table illustrates points 1 and 2. The degrees are of Celsius:

	Least Temp. of Plate.	Temp. of Spheroid.	Boiling Temp.
Water.....	142°	96.50°	100°
Alcohol.....	134 "	75.05 "	78.26 "
Ether.....	61 "	34.25 "	35. "
Chloride Ethyle.....	10.05 "	12.50 "
Sulphurous Acid.....	35 "	-10.05 "	-10.08 "

With regard to point 4, experiments gave the following results:

To evaporate 0.10 grammes of water, it took 207 seconds when the temperature of the plate was 200° Cel.; 91 seconds, when it was 400°; 73 seconds, at a dull red heat; 50 seconds at a full red heat; while at the boiling point it took only 4 seconds.

Many reasons have been propounded to show why the spheroid doesn't become hotter than it is. Boutigny supposed that the heat from the plate was reflected by the bright surface. Thus, if we place a bright object before a fire, it doesn't get very hot; and as the spheroid does not touch the plate, it is not heated by conduction.

Boutigny thought that many boiler explosions might be explained from these facts. The water in the boiler assumes the spheroidal state, and when the heat is lessened an explosion occurs. It is difficult to understand how it can get in this state. But practical men of note have supported the assertion that it does so according to all appearances.

Curious Experiments.

If we thrust a white-hot iron rod into water, we can see that it remains white-hot under the water for some time, and the boiling does not commence for several moments. This phenomenon is the same in character as the above. So are the following:

Boutigny (and after him many others have done the same thing) thrust his arm into melted iron without having it burned, having previously moistened it. Blacksmiths have been known to lick white-hot iron without getting their tongues blistered, as would be the result were the iron not so very hot. Any one can try a simple experiment of the kind which does not demand so much nerve. If we tie the finger of a glove on a stick and thrust it dry into melted iron, it is charred; if we wet it first, it is not charred, and we can see that the iron does not come in contact with it. In all these experiments, the heated liquid and the arm or glove do not touch, but are separated by vapor, as in the spheroid of liquid over our heated plate. And in the last case, if we move the stick rapidly through the melted iron, we find that it is charred on the side which is towards the front, for here the pressure has removed the vapor.

The fact that the temperature of the spheroid is below the boiling point of the liquid enables us to perform other curious experiments. Thus, sulphurous acid boils at a very low temperature. Boutigny dropped this substance in a hot crucible and into it, when in the spheroidal state, inserted a little vessel holding water. The water was frozen, although the outer vessel was red hot. In the same way, by using solid carbonic acid, Faraday has even frozen quicksilver in a red-hot crucible. This is possible with many other substances, where we can get the boiling point of one near the freezing point of another.

The lecture was illustrated by a number of experiments, which made it particularly interesting to the audience.

VERY useful and convenient is the new invention just patented—a wire spring to secure ladies' veils to their bonnets.

A PAPER MILL is projected at Reno, Nevada.

A Whaling Incident at Monterey.

The Monterey Democrat gives the following description of the narrow escape of the crew of a whale-boat a short time ago.

The party had struck and made fast to a California gray, a species of whale they describe as particularly vicious, and were approaching him for a shot with the bomb-gun. There were a lot of porpoises around the creature, which suddenly appeared to be "galloped" by them, and paused in his race. The boat, under sail and running swiftly, got unawares within the sweep of the leviathan's tail, and when the shot was fired a stroke in response from that tremendous engine crushed like an egg-shell the timbers of its bow. The sea rushed in through the fracture, and the boat being weighted down with her crew, an anchor and two heavy guns, sank several feet below the surface. The captain had been struck in the side by a fragment of the broken timbers, and was almost paralyzed. In the confusion, for a moment or two, no one thought to cut the rope by which the fish was fast, and it had resumed its flight. A tragedy was imminent, but luckily the captain, recovering himself, ordered the rope to be cut, and the immediate and most pressing danger escaped. The peril was, however, still considerable. Two of the crew could not swim, and they were all immersed to their necks in ice-cold water. Once or twice the boat rolled over, and they were in that perilous condition for half an hour before their consort, which was at some distance, heard their cries and came to their rescue.

A LARGE TURBINE.—The Carson Register, after a visit to the mill of the Yellow Jacket Co., at Empire City, thus describes the hydraulic motor:—The water, used to run the mill, passes through the large flume (14 x 4 feet), which also supplies the Mexican mill, one mile above. At present 5,350 cubic inches of water per minute pass through a 63-inch Lafell (or American double action) turbine wheel—the largest one in use on the Pacific Coast. The pedicle of this wheel is surrounded by an air-tight curb, so constructed as to create a suction below and give double force to the water pouring into the wheel. The parts are so accurately adapted to each other that the turbine utilizes the power so as to produce an effect equal to about 90 per cent. of the power expended. On the upper part of the perpendicular shaft of this wheel is affixed a cog-wheel fitting into a similar one fastened upon a horizontal iron shaft. To the end of the latter shaft a pump-rod is attached, which hoists all the water used in the batteries, pans, etc., while in the center of the shaft is a large wooden drum or band-wheel, over which passes a leather belt 30 inches wide and 125 feet long. This communicates motion to all the machinery in the building, save the pump.

FISH.—The Humboldt (Nev.) Silver State urges more stringent laws against the indiscriminate slaughter of fish, and more active measures for stocking streams. It says: The experiments made by Col. Evans, of this place, have demonstrated the entire feasibility of introducing into our mountain streams any of the varieties of fish which are found in the large bodies of water in the State. He has on his place several ponds now filled with at least three varieties of mountain fish, and finds that they thrive wonderfully and increase with astonishing rapidity. We mention these facts to show the feasibility of growing fish in our mountain streams, now destitute of them.

ERMINE.—Mr. Sanders, an agent of the South Yuba Canal Co., in Bear Valley, yesterday sent down an ermine, or white weasel, which was killed in that locality a day or two since. The color of this animal is brown in summer and changes to pure white in the winter. The skin is highly prized for trimmings of robes, and also for collars, muffs and cuffs. The lady who gets a genuine ermine set, considers herself fortunate. If Sanders can find many such, he will make a fortune. This specimen is probably the first found in California.—Nev. Trans. Jan. 21.

BORAX.—The Inyo Independent, of the 14th, says: A large deposit of borax has been discovered at or near Fish Slough, some five or six miles from the bridge across Owen's river, in Bishop Creek precinct. The borax is found in beds; is slightly impregnated with saltpetre, and after having been tested at several blacksmith shops, is pronounced of the best quality. The claim is owned by Brookman, Ryan, Westerville and others.

Gold and Legal Tender Rates.

San Francisco, Thursday, Feb. 2, 1871.—Legal Tender
buying @90; selling @90½. Gold in New York to-day
111½.

Table of Contents.

Blood's Imp. Car Seats, Ill.....	65
MECHANICAL PROGRESS.—Peat for Gas; a Great Gun; Sewing Machines; Composing Ma- chine; Horse Shoe Rolls; Largest Litho- graphic Press in America.....	66
SCIENTIFIC PROGRESS.—The Eclipse; Electro- Motive Force of Metals; Graphite; Eozoon; Electro-Magnetism.....	66
Bound East—At Chicago; Flint Creek, Monta- na; First Railroad; First Locomotive; Desert Ship.....	67
MINING SUMMARY; Mining Shareholders' Di- rectory; Mining Share Market; New Incorpor- ations.....	68-69
INDUSTRIAL MISCELLANY.—Cotton Culture in Cal.; McCormick Reaper and Mower, Ill.; Salt Making in Alameda; Grape Culture in the Foot-Hills.....	70
Vaporization and Elastic Force of Steam; Whal- ing Incident; Large Turbine; Fish; Ermine; Borax.....	71
Formation of Gold Nuggets Ill.; Concerning Mines; Mineral Lands and School Land Grants.....	72
Cheap Country House; List of Patents; Notices of Recent Patents; Miners' Convention.....	73
Peru Railroads.....	73
HOUSEHOLD READING.—The Skin and its Func- tions, Ill.; Eating Pork; Domestic Receipts; Mechanical Hints, etc.....	74
Notes of Travel in San Joaquin County; Tax ing Deeds.....	76

Concerning Mining.

A pamphlet has just been issued by Mr. Almarin B. Paul (well known to the mining community as one of the oldest quartz miners on this coast) which sets forth the advantages of his new process, both in a metallurgical and in a mechanical sense, and which contains strong certificates that really remarkable results have been obtained by Mr. Paul's method. Our purpose is not, at present, to dwell on the merits of this process, of which we have spoken from time to time as fresh results were obtained by practical working; but we think it proper to call attention to some of the remarks, in the pamphlet, on mining in general,—remarks which are worthy of consideration as coming from one exceedingly well acquainted with the needs and short-comings of our mining interests.

WHY MINING HASN'T PAID BETTER.

In the course of his remarks, Mr. Paul gives several reasons for the failures of many enterprises. He says, in this connection:

"Look at the Pacific States and Territories, abounding with more mineral wealth than any portion of the civilized globe, and yet the cry is, 'Mining can't be made to pay.' Are these vast riches thrown broadcast for nothing? That more has not been made out of mining, considering the amount of capital invested, is, at first blush, surprising; and yet, when we stop to examine into the condition of the business, we are not so much at a loss. What pursuit is there that stands the same amount of ignorance, recklessness and expense, as the majority of mining enterprises?"

"Failures may often be attributed to the high rate of labor, but a critical investigation will also show that it may more frequently be attributed to: 1st—Too extensive as well as too expensive machinery on too small developments of positive property. 2d—Too much expenditure in corporate associations for speculative purposes, and too little for practical mining. 3d—Too small a percentage of metal saved after heavy expenditure for extracting and raising ores.

"That mining should be the most extensive business on this coast all will admit, and that it can be made the most profitable, I am firmly convinced, but not after this reckless system of the past. We must go slower, calculate closer, and work ores better."

THE WASTAGE OF PRECIOUS METALS.

On this important point, too much stress cannot be laid. In the course of his re-

marks, Mr. Paul opens the subject of the loss of silver associated with the gold, deserving the credit of being the first of our California miners who has undertaken to clearly demonstrate the fact.

"The wastage of precious metals, by our present mode of working, has been the cause of a general complaint, and so serious has been the loss that Congress contemplated interfering and making it obligatory upon operators to give more attention to their recovery, to prevent wastage and increase the product.

"That there has been still too great a wastage of precious metal all admit; not only is this in our gold in gold mining, but in the silver associated with the gold. This fact is not generally understood, as California miners are not accustomed to getting silver with the gold, a thing precluded by their present mode of working. An investigation will disclose the fact that nearly all the gold ores California contain no meager percentage of silver. The same may be said of the 'gold ores' of other States and Territories. By way of illustration the following assays are given:

	Gold.	Silver.	Total.
Ore from Mariposa County.....	\$12.06	\$4.90	\$16.96
Sulphurets Washington Mine.....	81.40	32.06	113.46
Blanket Washings.....	4.13	6.77	10.90

"The yield of Quartz Mountain ran 9 per cent. silver. The ores of all the counties of California carry silver, and my experiments show they run from 3 to 50 per cent. of the yield.

"The closer the concentration from batteries, the higher is the percentage of silver. It is time we were investigating more closely, and outgrowing this rushing system of mining, and, instead of sluicing our silver and gold down streams, seeking modes of working that will produce less wastage. As far as California is concerned, I am satisfied that not more than 40 per cent. of her gold is extracted. The present great depression in the mining interest proves my position true. If I am in error, why is there not more success? Why so much poverty amidst so much wealth? The ore assays well, showing that metal is there. Now why don't they get it? The fact is, as before expressed, we are not working for gold or silver, but to crush rock."

THE CONDITION OF THE GOLD.

Mr. Paul's opinions are given by the following extracts:

"Our present general system of gold mining is based upon the idea that gold is mainly coarse, while examination will show that the high percentage is in atoms finer than flour itself. In my experiments gold has been taken up so fine that in distilled water it would not precipitate in less than from five to ten minutes. Can you save gold of this kind by running water down stream? Again, can you obtain the gold of this fineness, without minute reduction? Therein lies the secret of high assays before working, and small returns after.

"Gold in its matrix, according to the highest authorities, is in a metallic condition. Such being the case, the first requisite is minute reduction, to the fineness of the gold itself, in order to release it. Gold in quartz of gravity enough to resist the pressure of any stream of water is the exception, and this is the aggregating of finer particles, the primary simple condition, in my opinion, being flour or powder of gold. It is the flour of gold we must seek to obtain, to get the wealth of our ores."

THE CONDITION OF THE MINER.

"The condition of the majority of miners is certainly very remarkable, all things considered. There are thousands in California, Nevada, Montana, Colorado, Arizona, and Idaho, possessing valuable mines, and in that sense have real wealth, and yet the majority possess little money, and are to all practical purposes poor. Now to reverse this state of things I have given much time and thought, and am convinced the evil arises from five facts which I will enumerate.

1st.—Too much waiting for capital. 2d.—Too much seeking for thousands instead of constantly putting in time for dollars. 3d.—Too much ideal valuation instead of estimated value by the development or profitable production. 4th.—Too little cooperative enterprise, whereby they could become independent of capital. 5th.—The lack of a correct system of associated labor and capital, where both shall be fully protected and equally rewarded."

Mr. Paul says truly that a cheap and efficient process will remedy these evils in great part and lead to most beneficial results. Naturally, he thinks his process is the one thing needed. For this point, we refer our readers to the pamphlet in question.

Formation of Gold Nuggets.

The formation of gold nuggets has been accounted for in various ways. At first the theory of their having come from veins which had been degraded and broken up, was generally accepted. Then the occurrence of large nuggets in drifts, of gold of a high standard, led to the idea of their growth in the alluviums, by successive layers of gold deposited from solution. This theory has lately had some able supporters, and an interesting article, taking this side of the question, was published in the PRESS of September 24th, 1870.

Mr. R. Brough Smyth in his most excellent work on the Gold Fields of Victoria, dissents from this last opinion, and in order that our readers may have both sides of the question, we propose giving his reasons in a brief article.

The purity of alluvial gold may be reasonably explained by the fact of its having been exposed for long periods to the action of water and atmospheric air, whereby the silver, copper, iron, etc., which are alloyed with the gold in the veins, have been decomposed and removed.

As to the size, large pieces of gold have been found in quartz veins. That we have not found as many large pieces in these as in the alluviums, is just what might have been expected. Every superficial foot of

auriferous drift represents many thousand feet vertical of veins, and until we shall have explored the existing veins completely and worked them to a depth equal to that operated on by the denuding forces of past ages, we cannot say whether or not the proportion of nuggets found in the alluviums is in excess. Scarcely any large nugget unearthed has not had a great quantity of quartz mixed with it; and it is reasonable to conclude that nuggets have been formed in the veins in the same manner and at the same time as other smaller pieces of gold.

The hundred weight of gold discovered on Dr. Kerr's station, in New South Wales, was taken from a vein which cropped out on the surface. The largest of the blocks was about a foot in diameter and weighed seventy-five pounds gross. Out of this piece sixty pounds of pure gold were taken. The Blanche Barkly nugget contained two pounds of quartz, clay and oxide of iron. Two large nuggets found at Dunolly weighed 2,952 ozs., and presented gold distributed through a rust-colored matrix. The Lady Hotham nugget contained much quartz and sulphurets of iron. Every nugget, large or small, which has not presented indications of having been much worn, has born with it proofs that it had been broken out of a vein.

Much stress has been laid on the fact that nuggets are sometimes found at a considerable distance from a quartz reef; but it has not probably been considered that the reef whence the mass was derived may have been completely carried away, and that the origin of the gold may not have been in what is now the nearest reef. Floating masses of quartz, such as found at Inglewood, may have contained many nuggets, and where the gold they contained was set free, we should look in vain for the reef. We have also to consider the conditions under which a mass of gold might be moved to a great distance when imbedded in a rock of low specific gravity.

It may be suggested, that if nuggets have been found in alluviums and tertiary strata, through the deposition of metallic gold from the meteoric waters which percolate the drifts, during the relatively short periods which have elapsed since the formation of these strata, it is even more probable that the same meteoric waters, percolating through and saturating the older sedimentary rocks and their intersecting quartz veins, should have formed, during the lapse of countless ages, quite

large masses of gold around nuclei in the many cavities of these rocks. This seems a just conclusion. It is hard to believe that the force which is active in modern times, was passive in remote periods.

Perhaps more weight might be attached to the theory alluded to, if these masses of gold were found only in deep leads (deep placers); but we find large nuggets protruding from the soil, buried only a few inches, and lying on the bed-rock in the most recent gravels,—in places, in short, where they could not have been subjected to the action supposed by the theory.

Mr. George Foord, admittedly one of the highest authorities on all questions relating to the chemistry of gold, says on this point: A good deal has been said and written concerning the formation of nuggets by the coalescence of grains of gold in the alluvial state. No one can say that this has never taken place, but my opinion leans very little to this view. The physiognomy of nuggets points almost invariably to their position in the lode. Their perfect or almost perfect uniformity of composition indicates also the same distinctly. So does the attached matrix. To give an example, I would instance a series of three large nuggets consecutively found at Tarrangower. These had one very rough side and one comparatively smooth side; and although found separately, the general characters were preserved throughout the three, so as to leave little doubt of their being elements of one series, so to speak, and derived from a vein in the rock, the two different kinds of surfaces being counterparts of the rock surfaces on which the gold had been originally depos-

ited, somewhat according to the engravings given above.

In dealing with questions of this nature, scrupulous—almost painful—accuracy in the observations is indispensable; and it is necessary that the observations should be numerous as well as accurate. The many opportunities of examining and testing the character of the gold in the form of nuggets have been let slip in times past, but we may naturally hope that extraordinary care will be taken in future to collect and record the results of experiments.

Mineral Lands and School-Land Grants.

Application having been made by outside parties to purchase from the State the one-half school section which embraces the Keystone and other mines, whereby the purchaser would have obtained three mines, worth at least \$1,000,000 for \$400, Commissioner Wilson has rendered an excellent decision on the matter. He says:

It appears from the papers in this case that the mining claim was located in 1864, and no survey of the township made until 1870.

The said mining premises therefore formed, at the date of said location, a portion of the unsurveyed public domain which, by the first section of the Mining Statute aforesaid, is declared to be "free and open to exploration and occupation by all citizens of the United States, and those who have declared their intention to become citizens;" and it of course follows that they were in the occupancy of the claim at the time of the survey by virtue of the authority conferred by said statute; and if it be now ascertained since the Government surveys have been extended, that the premises are within a school section, a circumstance of which the miners could not have previously been cognizant, it is held that their right to the execution of the said statute of July 24, 1866, is not effected, and that upon a compliance with its provisions the applicants shall be entitled to a survey and patent, the State of California being entitled to indemnity in other lands for the area thus patented.

CALAVERAS LANDS.—Lands in Calaveras county are held at high prices which were almost worthless before the railroad started.

A Cheap Country House.

We present our readers to-day with the plans of a neat country house, adapted for a dwelling of rather moderate cost, and well suited for a village or suburban resi-

very convenient also in wet seasons. As the accompanying design was prepared for a country house, all these convenient arrangements have received particular attention, at the same time that economy in construction has been kept in

conformity with the dining room by sliding doors, also projects, and is furnished with a bay window similar to that in the dining room, looking north, south and west. These rooms are each 16 feet wide and 18 feet long, and furnished with fire-places.

propose to show to a still further extent. There is much room for improvement in the matter. A farmer's house now is apt to be a very unwelcome looking edifice, a sort of a box in which to stow himself and family away, without much regard to the looks of the box or the comfort of the occupants.

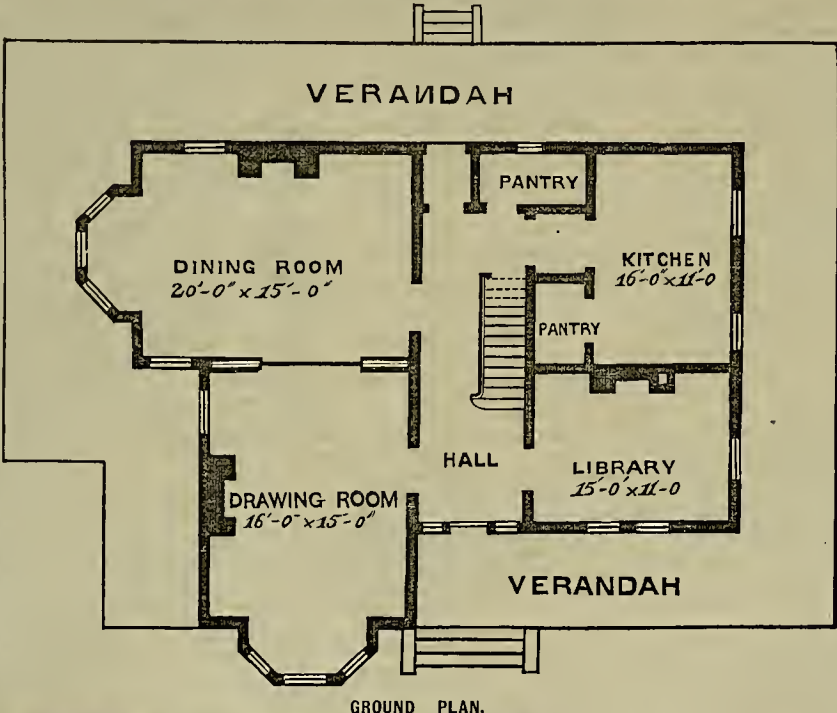

PLANS OF A CHEAP COUNTRY HOUSE.

dence, or even for a farm house, although it lacks a woodhouse, which, however, can easily be added.

In the interior, too little attention has been given to architecture. Our farmers' houses are too often very homely, ungainly structures, not at all inviting to the eye. Now we believe in making one's home as attractive as possible, without going to great expense. That one can have a pretty residence, which he can well be proud of, and still without necessarily expending large sums of money, is shown by the present illustration. We propose giving a number of such designs from time to time.

It is very im-

To the right of these rooms is a spacious hall, nine feet wide, running right through the house from back to front, in which are placed stairs leading to the upper rooms. Opposite the drawing room is the library furnished with a fireplace. In the rear of the stairs and opposite the dining room is the kitchen, connecting with main hall by a short passage, and on each side of this a pantry—one opening out of the kitchen and one off the main hall. On the first floor—the chamber floor—there are five bed rooms, and a dressing room connecting with the best bed room, and three wardrobes. The three principal bed rooms are provided with fire places. Although the up-

per story is termed a half one, the bed room ceilings are ten feet high, and only a small part of the slope appears in the rooms.

The exterior will have a very pretty appearance, broken up as it is with projections, bay windows, verandah and steep-pitched roof. Such a house, though commodious and ornamental, need not be an expensive one. If properly built with timber and placed on a brick foundation, it would last for many years, and if due regard were paid to the selection of seasoned lumber and the walls properly plastered down to the floor, a warm and durable house would be the result.

It will be seen by referring to the elevation, that it is the intention to build this house of timber, and frame in the usual manner, the sills of the frame resting on brick or stone foundations, whichever may be most conveniently procured in the locality. The outside will be sheathed with one and a quarter tongued and grooved and upright boards and the joints covered with inch by three-inch batten. The interior can be finished to suit the tastes of those who may build.

There is no reason why our farmers should not have as nice and comfortable dwellings as anybody else. Of course we mean within reasonable bounds. Nor is there any reason why they should not develop a taste for the beautiful. These little attentions to ornamentation do not necessarily require large expenditures, as we have shown in the present article, and

portant to secure, in connection with a dwelling house, plenty of verandah room and large and airy apartments capable of easy and complete ventilation. These appendages, besides being ornamental and giving relief to plain walls, are pleasant as an out-door retreat in hot weather, serve to keep the interior cool, and will be found

view. By referring to the drawings, it will be seen that the house is entirely surrounded by a wide and airy verandah, the roof of which is supported by light lattice posts. The dining room projects from the main wall and is furnished with a bay window, where views can be had to the south, east and west. The drawing room, which

PATENTS & INVENTIONS.

Full List of U. S. Patents Issued to Pacific Coast Inventors.

- (FROM OFFICIAL REPORTS TO DEWEY & CO., U. S. AND FOREIGN PATENT AGENTS, AND PUBLISHERS OF THE SCIENTIFIC PRESS.)
- FOR THE WEEK ENDING JANUARY 24TH.
- TYPE-CASTING MACHINE.—William Wallace Dunn, San Francisco, Cal.
- TRUSS.—Alexander Folleau, San Francisco, Cal. Antedated Jan. 13th, 1871.
- BOOT-STRETCHER.—Isaac M. Myers, San Francisco, Cal.
- ATMOSPHERIC-PRESSURE ATTACHMENT FOR DENTAL PLATES.—John H. Beers, San Francisco, Cal.
- VARIABLE CUT-OFF FOR STEAM ENGINES.—William B. Cross, Sacramento, Cal.
- TREATING FRUIT TREES TO PREVENT THE RAVAGES OF INSECTS, ETC.—Samuel J. Everett, Mahoney City, Cal.
- OPERATING CUTTER FOR STEAM PLOWS.—Oliver Hyde, Oakland, Cal.
- ELASTIC TIRE FOR TRACTION ENGINES.—Oliver Hyde, Oakland, Cal.
- EMBALMING.—Benjamin F. Lyford, San Francisco, Cal.
- PLOW.—Jackson P. Pritchard, Conn Valley, Cal. Antedated January 14, 1871.
- MILLSTONE-DRIVER.—John J. Tomlinson, Bozeman City, Montana Territory.

Notices of Recent Patents.

- SAWING MACHINE.—Per Johnson, Columbia, Cal. The object of this invention is to make improvements in mounting and operating saws, and also to provide a portable sawing machine. The device consists of a box or cart-body, which is provided with wheels on which the apparatus is moved when a change of location is required, and which serve as balance wheels when the saws are being operated, the machine then resting upon legs which, at other times, are folded up against the body. Connected with the shaft of these wheels by belting and other appropriate means, are the saws which are secured in a suitable frame and are placed at suitable distances apart to cut wood into lengths for fuel. By the combination, a person standing at the rear of the cart will be able to drive the saws at great speed with little exertion, as the heavy cart wheels serve as fly or balance wheels to keep up the movements of the saws. The idea is novel and the contrivance is certainly very neat.
- CAR COUPLING.—J. R. Palmer, Mariposa, Cal. This is an ingenious invention, which enables the coupling of cars to be effected automatically, and the uncoupling to be done without the necessity of going between the cars. It will be illustrated in the PRESS.
- EXPLOSIVE COMPOUNDS.—J. Hafenegger, San Francisco. This invention relates to certain compounds for blasting, employing ingredients to secure quick and complete combustion, and thus a more effective blast, with but little smell or smoke; also to an improved cap or firing tube, which shall be both safer and cheaper than those commonly employed. Mr. Hafenegger has diligently studied the matter of explosive compounds for years, and is well known as the inventor of a large number of blasting mixtures.
- COMPLIMENTARY TO THE PACIFIC COAST.—The Stetefeldt furnace is to be erected at Ocker, in the Hartz Mining District, Germany. The introduction of amalgamation, in place of smelting, is talked of. That an American—a Pacific Coast—process should supersede a German process in Germany, is a fact on which we may be permitted to talk a little proudly.

HOUSEHOLD READING.

The Skin and its Functions.

The advantages of bathing and friction will be seen and understood by considering the structure of the skin, which cannot be explained by a verbal description. We therefore insert a cut, drawn from a section of skin as seen under a microscope, and clearly delineating the different parts of this complicated and important organ, and showing the necessity of cleanliness in order to the perfect performance of its functions. We copy, with slight modifications, from a work written by Dr. Bellows, entitled: "The Philosophy of Living."

1. Cuticle, or Scarfskin.
2. Rete Mucosum, or Mucous Web.
3. Corpus Papillae.
4. True Skin.
5. Cellular Membrane, or Fat Cells.
- 6 and 7. Perspiration Glands and Ducts.
8. Roots of Hairs.
9. Oil Follicles.

1. *The Cuticle or Scarfskin* is the dry membranous outside covering of the body, consisting of laminae of hardened mucus, or albuminous matter, without nerves or blood vessels, and therefore without feeling or life, except a kind of vegetable life. It is, when kept clean and fresh, as it may be by daily ablution or friction, spongy and porous, so as to admit through it freely the perspiration, &c., which exudes from beneath; but when neglected becomes hard, and filled with concreted impurities, which obstruct the natural secretions, and become the source of much derangement of the system, and many diseases both of the skin and other organs. It forms into small microscopic scales, as we can see at any time by applying friction or a moist cloth to any part of it, and is separated in blisters on the application of heat or irritating substances, as Spanish flies, mustard, &c.

2. *The Rete Mucosum, or Mucous Web* in which resides the coloring matter which constitutes the complexion, and which, in the Ethiopian, is black. Like the cuticle, it is not organized with nerves and blood vessels, and therefore not absorbed, and being covered with the cuticle, does not form scales. It therefore remains almost permanent, and letters and figures inserted with coloring matter like India ink, remain during life. It is this inertness that renders diseases of the skin so difficult of cure. In the cure of disease absorption is necessary; therefore those parts in which the absorbents are inactive, as in the cartilages bones, and rete mucosum, when once diseased are very slow of cure, the irritating matter being out of the reach of the absorbents.

3. *The Corpus Papillae* is that sensitive part of the skin in which resides the sense of touch. It consists of a collection of papillae formed by the extremities of the nerves and vessels; which, after having passed the true skin beneath, are grouped in little pencils or villi on a spongy erectile tissue. These villi are disposed in pairs, and when not in action are soft and relaxed, but start up erect when employed in the sense of touch. They are very readily seen when a blister has removed their covering, and give the acute sensibility which in that case is felt to the touch, the scarfskin being necessary to modify and blunt the sensitiveness of the uncovered papillae.

4. *The Deeper Layer, or True Skin.*—This consists of a dense collection of fibres, forming a firm stratum, interspersed with holes for the passage of nerves and blood vessels, and is mostly composed of gelatine;

and the skin of animals is therefore used for making glue. Gelatine, when united with tannin, forms a substance which is insoluble in water, and constitutes the leather for our boots, &c.

These four strata constitute the skin, which is united to the structures below by cellular membranes, which contain more or less adipose matter, or fat, which is represented by the little globules under the skin, marked 5. We shall continue this subject next week.

Up Country Letters.

A Few Words about Eating Pork.

DEAR READER:—I have been thinking of pork to-day. It happened in this wise: The farmer's wife was getting supper, and as the savory (suffocating?) smell of the frying pork met my olfactory nerve for the third time to-day, I asked the abrupt question of the good wife, "Why do you eat so much pork in the country?"

The red face and burnt eyes turned toward me as she answered, impressively, with upraised fork, "Well, it is the cheapest, easiest to get, and we like it best?"

I sat in my invalid chair and pondered. "Cheapest?" let me see. If they should make Johnny cake of the sour milk and corn they give the pigs; bake the apples, and feed them *first hand* to the family at every meal; give potato skins and refuse from vegetables to the live stock, which considers such food dainty morsels; feed the table crumbs to the chickens; would it really not be a cheaper way?

As to its being "the easiest to get"—with a butcher's cart passing the house daily. Surely she forgets the hard work, during "killing season," trying of lard, salting down, sausage making, smoking of the hams and sides; weary hours and days spent in preparing and preserving the entire animal for future use, certainly can't be called *easy*. I do not speak of the care bestowed on the living animal, fattening, etc. And as to their "liking it best"—recalling to mind the amount of fresh meat eaten individually and collectively at a single meal, when it is cooked, I begged to differ from her, but I was silent, thinking of the evil effects of pork eating on our people.

Common observation has long since set down the prevalence of scrofula, erysipelas, a variety of glandular and eruptive diseases, and even consumption, as resulting from impure blood, caused by eating the impure flesh of the hog; while our scientific men have discovered the existence of myriads of living animalcules, called *Trichinae*, which are found only in the hog, until taken into the human system by eating its flesh! Are not such facts enough to warn mankind to choose purer and better food than swine flesh.

A good story is told of Dr. Adam Clark, who, when desired to ask grace at a dinner party where a roasted pig graced one end of the table, suggested the possibility of God's blessing under the Gospel, what was cursed under the law!

One of these days, when I get stronger, I am determined to bring up this subject again to the good wife, and ask her, if after reading the scrap I send you for perusal, on the fatal effects of pork eating, she can conscientiously feed her children on *Trichinae*, even if they are cooked!

JEWELL.

BEE STINGS MECHANICALLY TREATED.

The *Scientific American* states that the poisonous effect of bee stings can be prevented, or at least considerably mitigated, by pressing over it the pipe of an ordinary trunk key. The reason is obvious. The pipe acting as an annular compress close to the puncture, forces the poison out. Could not this simple process be extended in its application to the bites of serpents and rabid dogs? The absorption and spread of the virus might thus be prevented, or at least retarded, until a physician could arrive with a more effective remedy.

RECONSTRUCTING POTATOES.

The French manufacture new potatoes out of old in the following manner: The potatoes are put into tubs of water and vigorously stirred about by the feet until the old dark skin has been rubbed off, when the tubers acquire a smooth and satin-like appearance. They are then dried, neatly wrapped in paper, and arranged in small baskets, which are sold in the markets for five francs each, as "new potatoes."

Domestic Receipts.

DYSPEPTIC'S BISCUIT.—Take Graham flour (wheat coarsely ground, without bolting) two quarts; corn meal sifted, one quart; butter, half a cup; sour milk to wet it up, and saleratus as for biscuit. Roll out and cut with a tea-cup and bake as other biscuit, and when cold they are just the thing for dyspeptics. And if the flour was sifted, none would refuse to eat them.

TO REMOVE GREASE FROM FLOORS.—To extract grease from old floors, apply a paste of wet wood-ashes, keeping it on several days, or cover the spot with pipe-clay. Grease on wall-papers, caused by persons rubbing their hands against it, is taken out by applying a cream of pipe-clay and water, leaving it to dry, and scraping it off. Stains on wall-paper may be cut out carefully with a sharp pen-knife, and pieces to match inserted with paste. When nicely done, it is, if not imperceptible, at least much better than black spots.

TO SOFTEN HARD WATER.—A small lump of quicklime dissolved in nine quarts of water, and the clear solution poured into a barrel of hard water; the whole will be soft water as it settles.

FOR A COUGH.—Where nothing better can be obtained, a strong decoction of the leaves of the pine, sweetened with loaf sugar. Take a wine-glass-ful. We often saw the same thing used, in the early days of mining in California, for the scurvy, contracted by long use of salt meat, and with good effect.

STRAWBERRY TOOTHWASH.—Pure strawberry juice, 4 ounces; tincture of orris root, 6 ounces; pure spirit, 3 ounces; tincture of rosemary, 1 ounce; tincture of cochineal, enough to color; mix thoroughly together, and filter. This compound is an agreeable and useful wash for the teeth and gums; removing the tarter from the former, and rendering the latter hard and healthy.

MOUTHWASH FOR SMOKERS.—Chloride of lime, 6 drams; water 4 ounces; agitate together one hour, filter and add pure spirit, 4 ounces; tincture of orris root and orange flower water, of each, 1 ounce.

TO PREVENT "MOTHER" IN VINEGAR.—Add a few drops of sulphuric acid to each gallon of vinegar, and it will thoroughly arrest farther vegetation of this kind.

Mechanical Hints.

PRESERVATION OF BRONZES.—Bronzes when placed out of doors too often become black and dirty, and cease to be ornamental. But it was observed in Berlin that those parts of a bronze statue which were much handled by the public retained a good surface, and this led to the conclusion that fat had something to do with it. An experiment was therefore tried for some years with four bronzes: one was coated every day with oil, and wiped with a cloth; another was washed every day with water; the third was similarly washed, but was oiled twice a year; and the fourth was left untouched. The first looked beautiful; the third which had been oiled twice a year, was passable; the second looked dead; and the fourth was dull and black. Perhaps public authorities in this country who have charge of statues and other adornments will profit by the experiments here described.

IMPROVED BRONZE MANUFACTURE.—Mr. J. L. Montefiore, of London, Eng., has recently devised an improved manufacture of bronze, in which phosphorus or a phosphoric substance is introduced during the process of melting the copper, tin and other metals which form the basis of the metal known as "bronze," whereby its quality in regard to elasticity, hardness, and toughness, is considerably improved as compared with the bronze manufactured in the ordinary way, as hitherto adopted.

POWER OF INDIA-RUBBER TO DEADEN SOUND.—*Chamber's Journal* gives this illustration of the power of india-rubber to deaden sound: "We once visited a factory where some forty or fifty coppersmiths were at work in a shop above our heads; but what was remarkable, scarcely a sound of their noisy hammering could be heard. On going up stairs we saw the explanation. Each leg of every bench rested on a cushion made of india-rubber cuttings. This completely deadened the sound."

HOUSEKEEPER.—It is a good plan to put new earthenware into cold water and let it heat gradually until it boils, then cool it again. Brown earthenware, particularly, may be toughened in this way. A handful of rye or wheat bran thrown in while it is boiling will preserve the glazing so that it will not be destroyed by acid or salt.

Life Thoughts.

A fox should not be on the jury at a goose's trial.

If an ass goes a traveling, he'll not come home a horse.

A good word for a bad one is worth much and costs little.

DESPISE not little temptations; for, rightly met, they have often nerved the character for some fiery trial.

MARSHAL SAXE used to say that in almost every dispute between a horse and a man, the horse was in the right.

RUN not after blessings, only walk in the commandments of God, and blessings shall run after you.

THE door between us and heaven cannot be opened if that between us and our fellow-men is shut.

THERE are two reasons why some people don't mind their own business. One is that they haven't any business, and the second that they have no mind.

A LITTLE second knowledge, with a great deal of care, goes further on a farm than great knowledge, half applied.

TRUST not the flatterer. In the days of sunshine, he will give thee pounds of butter; and in the hour of need, deny thee a crumb of bread.

A CLEAN TONGUE.—It is good in a fever, and much better in anger to have the tongue kept clean and smooth.

"God Bless You, my Little Fellow!"

A crippled beggar was striving to pick up some old clothes that had been thrown from a window, when a crowd of rude boys gathered about him, mimicking his awkward movements, and hooting at his helplessness and rags. Presently a noble little fellow came up, and, pushing through the crowd, helped the poor crippled man to pick up his gifts, and placed them in a bundle. Then, slipping a piece of silver into his hands, he was running away, when a voice far above him said: "Little boy with a straw hat, look up!" A lady, leaning from an upper window, said earnestly: "God bless you, my little fellow! God will bless you for that." As he walked along, he thought how glad he had made his own heart by doing good. He thought of the poor beggar's grateful look, of the lady's smile, and her approval; and last and better than all he could almost hear his Heavenly Father whispering: "Blessed are the merciful, for they shall obtain mercy." Little reader, when you have an opportunity of doing good, and feel tempted to neglect it, remember the "little boy with the straw hat."

GREATNESS AND GOODNESS.—It is not possible for us to make our children great, but we can do a great deal toward making them good. Great influences that we cannot understand, stretching over the whole span of our life, will make one man as great as a Mariposa redwood, and another as small as a dwarf-pear. Yet this, in its degree shall be as good as this, while the sun will shine, and the rain fall, and the blessing of heaven rest on both. But the possibility is that the little one may become not only good, but great. Goodness of itself may be greatness, as it was in Washington and Lincoln; or there may be greatness without goodness, as the vast catalogue of mighty men who have been the scourge and curse of the race can testify.—*Robert Collyer.*

WHAT'S THE USE?—What's the use of minding what they say? What's the use of lying awake nights with the unkind remark of some false friend running through your brain like forked lightning! What's the use of getting into a worry and fret over gossip that has been set afloat to your disadvantage by some meddlesome busy-body, who has more time than character? These things can't possibly injure you unless, indeed, you take notice of them, and in combining them give them character and standing. If what is said about you is true set yourself right at once; if false, let it go for what it will fetch, until it dies of inherent weakness.—*Termini.*

MEN'S happiness springs mainly from moderate troubles, which afford the mind a healthful stimulus, and are followed by a reaction which produces a cheerful flow of spirits.

A TROUBLED mind is often relieved by maintaining a cheerful demeanor. The effort withdraws its attention from the cause of pain, and the cheerfulness which it promotes in others extends by sympathy to itself.

New Advertisements.

VAN NOSTRAND'S

Electric Engineering Magazine,

Commenced January, 1869.

Consists of articles selected and matter condensed from all the Engineering Scientific Serial publications of Europe and America.

The third volume of this Magazine is completed by the issue for December.

The growing success during the past two years demonstrates the correctness of the theory upon which the enterprise was founded. Communications from many sources prove that the Magazine has met a widespread want among the members of the engineering profession.

A summary of scientific intelligence, selected and sifted from the great list of American and European scientific journals is at present afforded by no other means than through the pages of this Magazine.

In the next volume, beginning with the January number, we shall commence some important improvements. Each number of the Magazine will hereafter contain something of value relating to each of the great departments of engineering labor.

More space than heretofore will be devoted to short discussions or elucidation of important formulae, especially such as have proved valuable in the practice of working engineers; our facilities for affording such items are extensive and rapidly increasing.

The progress of great engineering works in this country will be duly chronicled.

Selected and condensed articles, with their illustrations, from English, French, German, Austrian, and American scientific periodicals, will contribute to make this Magazine more than ever valuable to the engineering profession, and will afford a compilation without which the library of the working engineer will be incomplete.

112 Pages, Large 8vo. Illustrated Monthly.

Price \$5.00 a year in advance, single copies fifty cents.

Notice to New Subscribers.

Persons commencing their subscriptions with the 3d year (January, 1871), and who are desirous of possessing the work from its commencement, will be supplied with Volumes I., II., and III., neatly bound in cloth, for \$10.00, sent free by mail on receipt of price.

Notice to Clubs.

An extra copy will be supplied gratis to every club of five subscribers at \$5 each, sent in oncomitance.

Manufacturers and have constantly on hand

SPORTING,

MINING,

And BLASTING

POWDER,

Of SUPERIOR QUALITY, FRESH FROM THE
MILLS. It being constantly received and transported
into the interior, is delivered to the consumer within a
few days of the time of its manufacture, and is in every
way superior to any other Powder in Market.
We have been awarded successively

Three Gold Medals

By the MECHANICS' INSTITUTE and the STATE AG-
RICULTURAL SOCIETY for the superiority of our
products over all others.
We also call attention to our

HERCULES POWDER,

Which combines all the force of other strong explosives
now in use, and the lifting force of the BEST BLASTING
powder, thus making it vastly superior to any other
compound now in use.A circular containing a full description of this Pow-
der can be obtained on application to our Office.

NOTICE.
THE undersigned having completed arrangements through one of the first "Promoters" in Europe, for placing CALIFORNIA MINING SECURITIES ON THE LONDON MARKET, is now able to offer superior facilities for disposing of reliable mines of gold, silver or other minerals, as above stated. All properties given in my charge will be placed direct, without loss of time, upon the London Market, through a perfectly reliable party, long resident and entirely familiar with the business. Every advantage offered to parties owning shares in American mines worked by English capital, to dispose of the same. Advances made and ample security given when required.

Shaft is over 400 Feet Deep,
and is kept free from water in its lowest level by the

BLAKE STEAM PUMP
SOLD BY
BERRY & PLACE,
112 California st., San Francisco. 4v22

STEAM JET PUMP.
Blakelock & Williams' Patent, for Water, Oils, Acids, Etc.

The best cold water pump for filling tanks for stationary or portable Steam Engines. Also highly recommended for MINES, DISTILLERIES, SALT WORKS, STONE QUARRIES, and similar places, and saves the expense of putting up and running an engine.
We ask the attention of all proprietors of steam power to the following points of merit:—It is operated by steam taken directly from the Boiler into the Pump; it has no valve or wearing parts of any kind; it requires no belts, pulleys, or machinery of any kind; it operates entirely independent of an engine; it will not choke up with foul water; it costs much less to put up and repair; it will not wear out in a lifetime, or require repairs; it is reliable, and certain to work at all times; it is not liable to injury from freezing.
Satisfaction guaranteed or the money refunded.
Send for Circular. **PARKER & HUNT,**
Southeast cor. Tenth & K Streets, Sacramento City Cal.
AGENTS—CHAS. F. BROCK, 117 California at., San Francisco; KEPP & BARGON, Stockton. Can be seen at McAFEE, SPIERS & Co's. Boiler Works, S. F. 21v21-4f

Blake's Patent. THE BEST PUMP for Boilers, Feeders, Breweries, Sugar Houses, Tanneries, Mining and Fire purposes, etc., is Blake's
Patent PUMP
It is simple, compact and powerful, needs no expert to run it, and will start at any point. Is warranted positive under all circumstances. Send for a circular.

THE WILSON Patent Steam Stamp Mill.

This extraordinary Mill, now so justly popular in the East, is now offered to the miners of the Pacific Coast. Having been in operation now for about two and a half years, the Company feel confident that the
WILSON STEAM STAMP MILL,
For Durability, Efficiency,
AND ECONOMY OF WORKING,
HAS NO EQUAL.
The Wilson Steam Stamp Mill is the only Steam Mill that has had the severe ordeal of practical working, and proved itself eminently successful. It is now in operation in several of the Eastern States and Territories, and gaining an envious popularity. The whole machine is so simple as to be readily understood by the most ordinary minds. In fact, its simplicity is its durability. The expense of crushing rock or cement with this Mill is less than one-half the expense of any other Stamp Mill, and less than one-half the cost. For further particulars inquire of
FURMAN R. WILSON,
San Francisco.
Or of THE WILSON STEAM STAMP MILL CO., 326 Walnut street, Philadelphia, Pa.
NOTICE.—All persons are hereby warned not to manufacture or use any Steam Stamp Mills that are an infringement on the Wilson Patents, as they will be prosecuted to the utmost rigor of the law.
F. R. WILSON,
20v19-4f Supt. W. P. S. S. M. Co., Philadelphia.

Varney's Patent Amalgamator.
These Machines Stand Unrivaled.
For rapidly pulverizing and amalgamating ores, they have no equal. No effort has been, or will be spared, to have them constructed in the most perfect manner, and of the great number now in operation, not one has ever required repairs. The constant and increasing demand for them is sufficient evidence of their merits.
They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.
This Amalgamator Operates as Follows.
The pan being filled, the motion of the muller forces the pulp to the center, where it is drawn down through the aperture and between the grinding surfaces.— There it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly passing a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.
Sellers made on the same principle excel all others. They bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed.
Mill-men are invited to examine these pans and sellers for themselves, at the office, 229 Fremont Street, San Francisco.

Gold Saving Amalgamated Plates.

U. S. & Foreign
PATENT AGENCY.

OUR U. S. AND FOREIGN PATENT AGENCY presents
many and important advantages as a Home Agency over
all others by reason of long establishment, great expe-
rience, thorough system, and intimate acquaintance
with the subjects of inventions in our own community.
All worthy inventions patented through our Agency will
have the benefit of an illustration or description in the
SCIENTIFIC PRESS. We transact every branch of Patent
business, and obtain Patents in all civilized countries.
The large majority of U. S. and Foreign Patents granted
to inventors on the Pacific Coast have been obtained
through our Agency. We can give the best and most
reliable advice as to the patentability of new inventions.
ADVANCE AND CIRCULARS FREE. Our prices are as low as
any first-class agencies in the Eastern States, while our
advantages for Pacific Coast inventors are far superior.
ENGRAVING ON WOOD, of every kind, for illustrating
machinery, buildings, trade circulars, labels, plain or in
colors, designed and cut in the best style of the art by
experts in our own office. Also, engraving on metals.

Machinery, Merchandise and Supplies of every description Purchased and Sold on
Commission.

AT LOWEST RATES.

General Agents for the

NATHAN & DREYFUS

SELF OILERS.

These Oil Cups are too well known
to require any lengthy description;
the following are the main points
of advantage.

We guarantee a saving of

75 PER CENT OF OIL.

They are composed of a transpar-
ent Glass Cap, mounted in Brass,
provided with a hollow tube, inside
of which is placed a loose acting
solid or hollow wire, which acts as
a Feeder and Regulator. The wire
rests constantly upon the Journal,
thereby acting with the bearing in
its motion. The wire is so regu-
lated inside the tube as to feed ac-
cording to the demand only. There
is no flow of oil whatever while the
machinery is not in motion.

They are as reliable in Winter as in Summer.

Being a perfectly air tight vessel, the oil will never gum in them, as this has been proven by four years' con-
stant use.

They are constructed in a very neat and substantial manner.

We spare no pains in making them as perfect as it is possible for them to be made, and guarantee them to give
perfect and entire satisfaction.

DIRECTIONS.

Fill the Cup full of Oil, then screw the Cap down air tight. Place the tube in the oil hole in an upright position
or upon an angle of 45 degrees. Permit the Rod to rest upon the journal, and have a perfectly free action. If you
desire to have the oil flow faster, reduce the size of the wire.

Take Notice.

All persons are hereby cautioned against buying, selling or using any Cup with a wire resting upon the journal
that is not stamped with our name and date of patent, May 21st, 1867, as we shall prosecute all infringement, signed
NATHAN & DREYFUS, New York, Jan. 1st., 1871.

WE ARE ALSO GENERAL AGENTS FOR THE

GARDNER & ROBERTSON AUTOMATIC SAFETY STOP GOVERNOR.

After an experience of eleven years in the manufacture of the above Governor, during which time several im-
portant improvements have been made and two additional patents obtained
we feel justified in recommending it to all parties using Steam power, and
warranting it to be the most perfect
regulator in the market.

The Gardner Governor is so well
known that we think it unnecessary to
enter into a detailed explanation of the
principles involved, or details in its
construction, merely giving the leading
objects realized by this important in-
vention. The Governor combines with
the greatest simplicity of construc-
tion, accurate regulation of speed, pos-
itive insurance against all accidents
liable to occur from slipping or parting
the Governor or driving belts, and a
convenient arrangement for adjusting
the speed of the Engine while in mo-
tion, without change of pulleys.

The construction of the Governor is
extremely simple, having no springs,
inside joints, swivels or parts liable to
disarrangement, all the several parts
are duplicates of each other in the same
series; the most skillful workmen are
employed, the best material used and
the machinery employed especially
adapted to their manufacture. Thus
we warrant these Governors to give perfect regulation of speed under all circumstances, and we will cheer-
fully refund the money, after a trial if not satisfactory. We keep a large assortment on hand.

When ordering, be particular to say Governor with THROTTLE VALVE or WITHOUT THROTTLE VALVE; and either
BLACK or FINISHED, as you may require. We are also Agents for the

Nathan & Dreyfus Automatic Cylinder Lubricator.

In introducing this valuable Cup to the public, we desire to call very particular attention to its many special ad-
vantages.

FIRST.—Nothing but clean oil or tallow is admitted into the Cylinder; no lime or sediment of any kind.

SECOND.—Its great economy of both tallow and fuel.

THIRD.—It is self-acting, and supplies the lubricating material only while the Engine is in motion.

FOURTH.—Its certainty and regularity of feeding, and increase of the power of the Engine.

The principle upon which this apparatus is founded is that, instead of admitting tallow into the Cylinder in con-
siderable quantities at uncertain intervals by means of tallow cups, grease cups, and other crude contrivances, and
allowing it to be instantly blown out at the exhaust (as must necessarily be the case), this cup, by its peculiar
action, delivers the lubricant in drops into the body of the steam, which thereby becomes thoroughly impregnated
or gassed before passing into the steam chest or Cylinder; the consequence is that instead of falling to the bottom
of the Cylinder, as it does when admitted through a tallow cup (which passes the lubricant from the bottom of the
cup to the Cylinder), it enters into the form of minute globules, and hence the whole of the internal parts of the
engine become regularly and constantly greased. The result of its action has been proved in a very great number
of cases to be an enormous saving of tallow, a considerable increase in the power of the engine, a great saving in
fuel, and reduction of internal friction to a minimum.

These Lubricators will save you 75 per cent of the Lubricating Material, and cost
no more than the common Compression Cups.

The Above Goods are Sold at Factory Rates.

VOLUME XXII.
Number 6.

The Fulton Plow.

From St. Helena, in Napa County, there comes a new one-horse plow, which has a number of points deserving the attention of the farmer; for the inventor claims for it certain advantages, which, if substantiated, will make it a most useful agricultural implement. In the accompanying illustration, A is the beam, attached to the handle in the ordinary way, and E, the

causing the plow to run steadily and hold with ease. Moreover, it applies the power of the horse to the best advantage. By having a center draft, it avoids the friction caused by the land-side being crowded up against the soil, and this aids in pulling and in holding.

These points are certainly important, but the inventor makes one more claim. He says that the plow can be run so closely to whatever is cultivated, that the hoe can be entirely dispensed with. On the large arms of the coast, hoeing is a very expensive item, and if a substitute for it can be found, it will be a most important thing for our farmers.

We are disposed to consider this a very

Palmer's Improved Car Coupling.

Our western regions enjoy a wide reputation for carelessness with regard to the preservation of human life. How well deserved this reputation may be, is a question which we do not propose to argue just now, except to express an opinion that it is exaggerated. But the fact remains that we do have such a reputation in the world at large. It is rather cheerful, then, to find a Pacific Coast invention, one of the merits of which is that it will tend to prevent the loss of life.

This is not the only merit of Palmer's car coupling, but it is one of them, and one which is by no means unimportant. The

between them preventing the link from falling out. This construction is shown partly in the large figure and partly in the small one.

The mechanism for opening the jaws, and uncoupling the cars, consists of a plate, G, which has two slots in it, inclined from the bottom upwards some distance and then vertical, through which are passed the jaws. This plate is moved up or down by means of the levers, F and E. By moving the handle E to the side (away from the center) the plate, G, is raised, the jaws opened and the link allowed to fall out. By moving it in the opposite direction, the jaws are closed, and when the plate, G, is pressed down as far as it will go, the jaws are held firmly closed, the upper part of the slots being vertical, as before remarked.

To automatically uncouple the cars, should one run off the track, there is a spring, H, attached below the hump in such a way that, if left free to act, it will press the plate, G, up and thus open the jaws and release the link. Ordinarily this is held away from the plate by a stop, I, which extends vertically nearly to the ground. Should the car get off the track, as the frame then is dropped a certain distance, equal to the height of the top of the rail, the stop strikes the earth and, in consequence of the forward motion, is thrown to the rear, thus releasing the spring, H, which immediately raises the plate, G, and uncouples the cars.

The operation is simply this: To couple, the lever, E, is moved to one side, opening the jaws and allowing the link, D, to enter. The shape of the hollow in the jaws guides the link into place. By reversing the lever, the jaws are closed, and by moving it far enough, so that the jaws enter the vertical portion of the slots, the cars cannot uncouple. To uncouple, the lever, E, is moved again to the side, thus opening the jaws and releasing the link.

This contrivance enables the cars to be connected or disconnected with great ease by a person standing on the platform, and obviates entirely any necessity of having a man go between the cars, where accidents so often occur. The mechanism is intended to be substantially built, durable, not liable to get out of order in ordinary cases, and is easy managed. The contrivance for uncoupling, should the cars get off the track, is also very ingenious and may save much loss of life. A patent has been granted for the device, through the SCIENTIFIC PRESS patent agency, to Mr. Jay R. Palmer, of Mariposa, Cal.; who may be addressed for further particulars.

FUEL SAVING.—Mr. Bryant, of Davis street, recently called our attention to a simple and effective device for economizing in burning coal, which he has in his office. It consisted merely in lining the front and bottom of the grate with a wire screen, so that the small particles of coal, usually wasted, are consumed. No. 16 wire, with $\frac{1}{2}$ inch meshes, was used, 50 cents worth of which is ample for two small grates.

THE FULTON PLOW.

plowshare, connected with the beam in a peculiar manner. For the standard, B is bent, inclined or attached to the plow in such a way that its upper end will be to the right, or away from the land-side. This upper end is provided with a plate, C, in which is a slot, D, through which passes the bolt securing the standard to the beam. A great variety of forms may be given to the standard, B, and the position of C may be varied according to the requirements of the case. Moreover, the slot, D, may have any length required for the purpose of adjusting and setting the beam at any desired angle.

The peculiar bend or curvature of the standard, B, and its position at or near the perpendicular center of the mold-board, brings the beam, whiffle-tree and handles some distance, say eight inches, to the right of the new furrow. This enables one to plow close up to rows of vines, plants, trees, etc., without interference on the part of horse or plow; allows the horse to walk in the furrow already made, where he naturally tries to walk, and where he is sure to walk in a straight line; and at the same time keeps the beam and line of draft true,

PALMER'S IMPROVED CAR COUPLING.

meritorious invention. Several agricultural societies have decided in its favor, it having received the first premium at the California State Fair for 1870, and at the Santa Clara Valley and Sonoma County Fairs. It is certainly worth enquiring into, and we refer our readers to the patentee, David Fulton, St. Helena, Napa Co., Cal., or to the manufacturer, A. W. Norton, Napa City, Cal.

HEAVY FARMING.—Sam. Brannan, having just finished seeding some five hundred acres of land in the vicinity of Calistoga, has transferred his working forces to his Yuba river ranch, consisting of twenty-five laborers, forty horses and three wagon-loads of plows, harrows, etc. He intends planting a large area of land along the Yuba this Spring.

The State Agricultural Society has offered a premium of \$25 for the best one-quarter acre of sugar beets.

device is illustrated below, and consists in so constructing the bumpers that the link which is attached to one will enter the other, when the cars are brought together, and thus connect them, without the need of having a man stand between them. It also consists in the use of a series of levers, which operate a plate having two inclined slots, by means of which the jaws of the bumper are opened and the link released without the need of further attention.

In the engraving, A is the car frame, mounted on trucks in the ordinary manner. The bumpers consist of two movable jaws, B, bolted on a rear beam or bar, and held together by springs, C. To afford the requisite yield, when the humpers come together, there is a spiral spring around the beam between the rear of the jaws and a cross-head, as shown in the cut. The front of the jaws are hollowed out in such a way that the link, D, is guided into them; and to hold the link in place, when inserted in the jaws, there are two grooves, corresponding to the sides of the link, the tongue

MECHANICAL PROGRESS.

LOCOMOTIVE BOILER IMPROVEMENT.—The *American Artisan* describes a novel system of boiler construction as follows: "In the proposed system, the ordinary horizontal tubular boiler is divided transversely into three compartments. In other words, it is made to constitute three boilers, having but one furnace for them all. The forward compartment is filled full by the feed-pump; the feed-water entering at its extreme front, and, circulating between suitably arranged diaphragms, at last enters the central compartment. This latter is furnished with a steam dome. The rearmost compartment in the immediate neighborhood of the fire-box is also kept full of water, and is so maintained by circulating pumps, which draw water from the central to the rear compartment, in which latter the pressure is considerably more than in the other. The rearmost communicates, further, with the central compartment by a valve at its upper part. The operation is essentially as follows:—the water in the foremost compartment is heated by that portion of the boiler-tubes through which the gases pass immediately previous to their exit to the smoke-stack, and the temperature of which is comparatively low. The heat from the gases at this part being thus utilized to the utmost, the water passes to the central compartments, devoted either wholly or only partially to making steam. From this the circulating pumps force it to the rearmost compartment, where it is heated, as just indicated, to a temperature above that in the central division of the boiler, ebullition being prevented by the complete filling of the compartment with the water. Passing back through the suitably arranged valve into the central compartment, the lower temperature of the latter causes a part of the water to flash into steam, which from the dome goes to the engine, while the water, reduced in temperature, falls, and is in due time again pumped into the rearmost compartment, heated, and caused to return, in the manner just explained, to the central or steam-generating compartment."

CHROME STEEL.—The editor of the *Iron Age* has visited the works of the "Chrome Steel Co." at Williamsburg, Pa., and was greatly pleased with everything connected with the establishment. His description we have not space for; but we give part of the concluding portion which refers to the product: "The company hold that their steel is superior to any thing manufactured in this country or in Europe, and back up their assertion by their willingness to prove it under any forfeiture. They say that it has properties and advantages entirely its own, and is especially adapted for tools of all kinds. It can be worked at a white heat—and can not be injured by over heating." It can be welded to iron or to itself, leaving no trace of the weld; it can be worked and reworked without injury; and, they claim that, when made into a tool, it will do at least 50 per cent. more work than any steel, not excepting the highest priced, and be perfectly uniform in each grade, and they so warrant it, with this qualification, that it must be treated according to directions, which are mainly that it should be dipped at a low red heat, as seen in the shade; that all tools forged from a large body to a small edge should be allowed to cool off after forging, and be reheated for tempering, and they claim that the only way in which it can be spoiled is by dipping it in water or hardening mixtures when too hot. Several bars were heated to almost a white heat at our request, then worked, reheated and reworked, tempered, and a specimen cut off, of most beautiful fine grain so hard as to cut glass. Another of the bars thus put through the white heat was split, allowed to cool, then heated again, hammered together without flux, and a chisel forged out of it, the edge being on the weld, which was tempered at very low heat, ground, and then tried on an ingot of steel, cutting out chips to half an inch deep, without showing any mark of bluntness or fracture; we took that cold chisel home as a sample. It shows the mark of having been sliced half way up the handle. As a test of toughness we were shown a $\frac{1}{2}$ inch square bar twisted cold until it looked like a cable, also a turning lathe shaving forty to fifty feet long. Dynamic tests of this steel have been made by David Kirkaldy, in London, also at West Point foundry, which latter showed as the highest strength of 12 specimens, 198,910 lbs.; lowest strength of 12 specimens, 163,760 lbs.; average of all the specimens, 179,980 lbs.;

or say, 180,000 lbs. per square inch, which is one-third more than Percy gives as the highest tensile strength attained in steel. It is further stated that run into wire it will tie into knots, and stand 400 pounds more in No. 16 than the wire used by hoop skirt makers; and Mr. Wood says that he can make a tool from it to drill through Stubbs' hardest file."

MACHINE FOR PIECING BOILER FLUES.—The *Railroad Gazette* describes the shops of the Chicago and Alton R. R., at Bloomington, Ill. Among other things noted is a machine for piecing flues. We quote:—"An ordinary locomotive tube has so little metal in it that it will hold a welding heat but a short time. It is therefore difficult for a blacksmith to strike fast enough to effect a perfect weld before the metal becomes cooled. Mr. Hughes, the foreman, having experienced this difficulty designed a trip hammer to be worked by hand. The hammer head and anvil each have a half-round die which conforms to the shape of the tube. The hammer helve is operated by a ratchet wheel with six teeth, and the hammer is brought down quickly by a steel spring. The shaft of the ratchet wheel and crank has a heavy fly-wheel to overcome the intermittent motion of the ratchet. With this machine a man can strike two or three times as fast, and with much greater precision than is possible by hand. The blacksmith's helper turns the crank, while the former handles the tube to be welded. The two have pieced out 150 2-in. tubes in ten hours, and have taken a whole set of flues out, pieced them up, and returned them to the engine in the same day. After they are welded up they are all tested by a hydraulic pump." Out of a set of 136 two only were found to be imperfect."

MORE OF PETROLEUM FUEL.—The *Chicago Tribune* of Jan. 21st notes the experience of Gen. Blunt at his lime kiln, in the use of petroleum as a fuel. The apparatus used consists of a cylinder, like a small locomotive boiler set on end, with a smaller cylinder within it, the intervening space being filled with petroleum. The smaller cylinder is filled with 600 small copper tubes, and through these the superheated steam passes, producing vapor from the oil that fills the interstices between the tubes. This vaporized oil rises through a layer of prepared sponge, and just at the point of exit is mixed with superheated steam in any required proportion, thus producing hydrocarbon gas. This gas passes through iron tubes to the point where the fuel is needed and is there burned. * * Gen. Blunt stated that his conclusions, based on results obtained, were that with the expenditure of \$25 per day for wood, he could burn 125 barrels of lime. The same sum expended for oil would, with the aid of this machine, turn out from 250 to 300 barrels per day, and one machine would be amply sufficient to supply fuel for three kilns. The saving in time was so great that he could produce the same effect with oil in three hours, starting with a cold kiln, that he could in twelve hours with wood.

STEAM ORE STAMP.—The *Engineer* of January 6th describes a modification of the steam hammer, lately constructed at Bolton, Eng., for the crushing of ores. The hoiler not being properly adapted to the machine, it was worked, on the trial, with half steam only, and gave an average of only 100 blows per minute, instead of 150, of which it is capable under favorable circumstances. Notwithstanding this and other drawbacks, two tons of ore were run through in thirty-six minutes.

CABLE SCREW WIRE.—The following is from the *Iron Age* of Jan. 12th: The latest and one of the most ingenious inventions for fastening the soles of hoots and shoes is that known as cable screw wire, which is cut off and driven into the sole by means of a machine bearing the same name. The wire is twisted into the form of a screw, instead of cutting the metal as in the ordinary process. The machine is capable of hot-tomming five hundred pairs of shoes daily.

WOOD ENGRAVING.—Thirty years ago there were not twenty professional wood-engravers in the United States; there are now four hundred. There are thirty-five engravers in steady employ at Harper's, and sixty-eight at Leslie's. In 1869 eighteen thousand wood-engravings were prepared for Mr. Leslie for which \$180,000 were paid.

SCIENTIFIC PROGRESS.

THE SOLAR PYROMETER.—London *Engineering* for Dec. 30, has a description, by Capt. John Ericsson, of his instrument for measuring the temperature of the sun. We quote briefly:—"At first sight, it will appear futile to undertake to measure temperature at a distance of 90,000,000 miles; but in view of the fact that the sun has been weighed by an instrument consisting principally of four leaden balls less than 10 in. in diameter, the attempt cannot justly be deemed absurd. The reader will remember that in the celebrated Cavendish experiments, afterwards repeated by Baily and others, the weight of the earth—on which the weight of the sun is based—was ascertained by measuring the attractive force of two spheres of lead weighing 174 lb. The delicate nature of the experiment may be inferred from the fact that the ascertained attractive force was found to be only 1-4300 of a grain. The illustrated device by means of which the temperature of the sun may be measured, involves no such nicety. Before entering on a description of the solar pyrometer, it will be necessary to call to mind the previous article in which it was demonstrated that the law relating to the radiant heat of spheres, is also applicable to concave spherical surfaces if the substances exposed to their radiant heat be placed in the center of curvature. The article referred to, also asserted that the temperature produced by the radiant heat transmitted by concave radiators of equal temperatures, at equal distances, is directly as their areas. ***The principle of my solar pyrometer is that of ascertaining the intensity of the heat of the sun by comparing the temperature produced by the radiant heat of a concave spherical radiator of 10 in. diameter, at a distance of 18 in. from its face, with the temperature produced by the radiant heat of the sun a sphere of 852-584 miles in diameter—at a distance of 91-430,000 miles from its centre. The radiant heat in both cases is transmitted through ether; in the former to the surface of the bulb of a thermometer; in the latter to the boundary of the earth's atmosphere. The law which governs the propagation of radiant heat through ether, is as absolute as the law of gravitation, whatever be the distance; hence the pyrometer under consideration, in which the radiant heat is propagated a distance of 18 in. through ether, is as competent to determine the temperature of the sun, as the Cavendish leaden spheres acting at a distance of 8.85 in. to determine his weight. **In the solar pyrometer we only require a correct indication of the temperature of the radiating concave spherical surface, and of the temperature transmitted to its focus; together with an accurate measurement of the distance of that focus, and of the area of the radiating surface. These points being determined with exactness, we may enter upon and carry out our computation without introducing a single correction."

ITACOLUITE.—Prof. Wetherill, whose idea that the flexibility of this curious rock is due to minute ball and socket joints throughout the mass has been opposed by Prof. Edwards, publishes another note upon the subject, a part of which we quote from the *Journal of the Franklin Institute* for January: "In order to see the joints, a thin section, supported at one end or at both ends, may be moved while under the microscope with a needle point; by changing the position of the section, a part may be reached at which the play of the joints may be perceived. They can also be seen by dissecting a flexible piece of the mineral, using either a fragment or a surface rubbed flat. The surface to be examined is inverted, tapped, and, as far as practicable, brushed free from loose grains. It is then examined under the microscope with a power of 40 to 60 diameters. The attention of the observer is first attracted by the irregular pits or depressions formed by grains of sand. By very delicate touches with a fine curved needle point, the surface may be investigated; loose grains of sand are seen and removed. Touching other grains and congeries of them delicately with the needle, proves that some have motion in a cavity formed of grains of sand and cemented together. These are dissected out, and other movable groups are found. Some have less motion than others, and some are immovable. By patient investigation of the mineral in this way, the observer will rise satisfied that it is made up of joints of the character which I have described."

ERICSSON ON SOLAR TEMPERATURE.—The following is from an article by Capt. Ericsson in *Engineering*: "Our space only admits of an allusion to the speculations and calculations which have been published of late by certain savans relative to solar temperature. Among these Zöllner's calculations may be mentioned as the most singular, being based on the height of the observed solar protuberances. Practical men who have witnessed the explosions in closed reverberatory furnaces, which take place when a dense mass of incandescent coal gas, resting on the fused metal, is suddenly ignited by the admission of oxygen, will probably attribute the solar protuberances to a very different cause from that imagined by Professor Zöllner. They will assert that the observed explosions in the solar atmosphere are quite possible without sending up gas from a depth of 139 geographical miles through the "ausströmungsöffnung," supposed by the German physicist. The reader may have noticed that some of the savans alluded to have attempted to set limits to solar temperature on chemical and dynamic grounds, insisting that the temperature of the sun is under 60,000° Fahr. All such speculations are futile, in view of the fact which we have established, that a heated sphere subtending an angle of only 32', at a distance of 90,000,000 miles, cannot, unless raised to a temperature of several millions of degrees, transmit radiant heat sufficiently intense to cause an elevation of temperature 84° Fahr. at the stated distance."

ONE SUCCESSFUL ECLIPSE PARTY.—The *Boston Advertiser* gives an extract from a private letter dated Catania, Sicily, Dec. 22d, and written by a member of the U. S. Coast Survey. "All the success seems to have been reserved for our party. Just before the instant of total obscuration there was a break in the clouds, which was the more remarkable because it was raining and hailing at the time. This break did not extend a thousand feet from the place where we observed. But it gave us a superb view of the corona and the whole totality, and enabled us to establish very important conclusions. It must be said, however, that there was just enough haze to deprive us of what I am disposed to call the false corona, and which I consider to be a part of our own atmosphere. But the true solar corona is clearly proved to be a solar atmosphere extending about eight thousand miles above the ordinary visible surface of the sun. There were three different sources of proof of this conclusion. The work is done successfully."

IMITATION VOLCANOES.—At a late meeting of the Vienna Geological Institute, M. von Hochstetter exhibited miniature volcanoes formed by sulphur in a soda manufactory. Sulphur melted in water under a steam-pressure of two to three atmospheres combines with a certain quantity of water. Larger masses of this melted sulphur (one to two quintals) were poured in conveniently deep wooden vessels. In consequence of the refrigeration, a crust was soon formed on the surface. In this crust a hole was kept open, through which, as the congelation of the sulphur proceeded, periodical eruptions of melted sulphur, together with exhalations and explosions of steam, were observed. After the lapse of an hour and a half, a miniature volcanic cone was formed, with all the characters of a volcano formed by successive lava streams. Observations which can be made during this experiment are sufficient to explain and to confirm many facts observed in real volcanoes. If the artificial eruption is interrupted by a second hole made in the crust, the cone becomes hollow, and if this hollow cone is crushed and the eruption again caused by closing the second hole, a model is formed of a younger volcanic cone which is surrounded by an outer barrier, like Vesuvius or the Peak of Tenerife. If the process is conducted to the end without interruption, the result is a massive cone with a closed crater, which resembles perfectly the homogeneous dome-volcanoes, as Seehach calls them. These domes, or massive cones, must therefore be considered as the inner massive nuclei of perfectly extinct volcanoes, the lava, ashes, and tufts of which have been removed by denudation.

CORRESPONDENCE.

Notes of Travel in Stanislaus County.

(Written for the Press.)
Modesto.

Modesto, in this county, is situated on the San Joaquin and Visalia R. R., 20 miles from Lathrop, the junction of the C. P. R. R., and about 30 miles from Stockton. The first building in this thriving little village was erected no longer ago than last November (1870), while now there are over 150 buildings, being an average of over one per day since the first one was erected. It contains one hotel, presided over by Jas. Cole Esq., a clever gentleman, by the by; also 4 boarding houses, 1 restaurant, 6 saloons, 9 stores, 4 blacksmith shops, 2 harness shops, 2 shoemakers, 2 meat markets, 1 stove and tin shop, 3 livery stables, and other things to correspond. James McHenry Esq., was the pioneer of this section. He first moved here in November last, but has been a resident of the county since the year 1863, and has been one of its supervisors. When Mr. McH. first moved to this county, the whole annual product of the county could have been shipped to your city upon a single steamer; now it ranks first in the production of cereals. This gentleman has shipped from here by railroad, since November last, over 2,000 head of hogs (alive), besides a large number of sheep. He owns personally about 800 acres of beautiful land, situated some 3 miles west from here, all of which will be in grain this season.

This section, extending from Lathrop and below in San Joaquin Co., to this point, and for three miles above here into Merced Co., is one complete grain field, for say 50 miles! Little or no fencing has been done in this county; a local law, forbidding loose animals running at large, protects the grain producers.

Wm. M. Hughes Esq., of the firm of Hughes & Keys, commission merchants of this place, is the possessor of some 2,550 acres of fine land, situated some 7 miles south-east from here on the line of the S. J. & V. R. R., all of which is in grain at this writing. Eight miles east from that point he owns and cultivates 1,800 acres more. Six 8-mule teams are now engaged in running gang-plows, (of the Matteson & Williamson make, of Stockton) upon this tract. It is also stocked with 1,600 head of fine sheep. The number of pounds of grain shipped from this point (Modesto), since Nov. 1st, 1869, by J. Mitchell, C. H. Hoffman, and Hughes & Keys, is 2,580,345. If there are good crops this year, ten times that amount will be shipped. W. O'Brien Esq., has shipped 220,000 lbs. of live mutton in the same length of time. Ex. Gov. Stanford's private secretary has just passed south, said to be on subsidy questions from Merced, Fresno and Tulare Co's.

Stages—New kind of Telegraph.

Stages, Z. & H. Fisher, of Stockton, proprietors, at present leave this point for Snelling, Plainsburg, Hornitos, Bear Valley and Mariposa, also for Visalia, three times per week, but will soon leave daily. This is a distributing post office, and the labors upon its Post Master, Mr. McEwen, are extensive, requiring a deputy to assist in order to get the mails off in any reasonable season. His salary, which is but \$280 per annum, should be \$2,000.

They have a new method of telegraphing in this section. It consists of a *lassie* and *laddie* who are supposed to be in love, but residing some 5 miles apart. Lassie milks a cow that feeds in the vicinity of laddie's house. Communication is had by enclosing a note in the old cow's tail, which is answered daily. The balance you can guess.

C. H. Sisson & Co's. U. S. Mail stages leave Wells, Fargo & Co's. office daily, (Sunday's excepted), from Stockton for Knight's Ferry, Chinese Camp, Montezuma, Jamestown, Sonora, Shaw's Flat and Columbia; also, stages for Mokelumne Hill, San Andreas, Angels, Vallecito, and Murphy's; also, stages for Telegraph and Copperopolis, Monday, Wednesday and Fridays, connecting at Murphy's with stages for the Big Tree Grove, daily, and at Chinese Camp with stages for the Yosemite Valley, via Conterville or by the New Road through Big Oak Flat, and Harding's Mills. On or about the 1st of March next, the stages will connect with the Stockton & Copperopolis Railroad, at Petersburg, 15 miles from Stockton for the above mentioned places. From Merced County in my next.

L. P. MO.

Bound East—At Chicago.

(Written for the Press.)
Western Enterprise.

Not many years ago, a company commenced a manufacturing business here (Chicago) in a small room, 14x20 feet. By careful attention to business and to the workmanship of the articles they turned out, they gradually built up a large trade, and now, under the name of the North Western Manufacturing Co., they occupy a three-story building, with 154-foot front, and employ constantly 400 hands! I passed through their very extensive works, where everything is conducted in a most systematic manner, and saw an immense amount of work going on. Steam engines, steam pumps, cranes, hoisting machines, steam heating apparatus, malleable iron castings, etc. They have made a specialty of the manufacture of wrought-iron steam and gas pipe for the last five years; and, although they have had a strong eastern competition

a cunning hand to execute.

The Pullman Car Company has become one of the leading business associations of the country; for at the east, no competing railroad line can expect to secure a large passenger traffic without having these most excellent cars, so popular are they with the traveling public. The main office and commissary department of the company are in Chicago; the manufactories are scattered throughout the United States.

The Chicago Office—California Woods.

The offices here are fitted up splendidly, handsomer ones perhaps, do not exist in the United States. Black walnut woodwork, frescoed and panelled ceilings and walls, rich carpets, magnificent furniture,—everything in the finest style and most exquisite taste. One of the rooms is a real curiosity, for it is papered with a material printed from the fibres of different woods, by some process, and so perfectly that it is almost impossible to think that the walls are not veneered with the real woods. The place is well worth a long trip to see.

The affairs of the company are conducted in a most thoroughly systematic order. The master spirit, whose influence is visi-

INTERIOR OF PULLMAN HOTEL DINING CAR.

to contend against; they have succeeded in building up a very large business in this branch of industry. They have been running their mill night and day during the past season, are using daily over ten tons of iron, and the superior quality of the pipe produced therefrom creates a demand for it not only in the north, south and west, but as far east as Ohio and Pennsylvania, a fact that is highly creditable to the skill and energy of this firm.

The Pullman Palace Car Company.

In 1831, a Professor Low was dismissed by the Faculty, from the chair he held in a Kentucky college because he was insane. His insanity was proved, in the opinion of his associates, by the fact that he had written and published a pamphlet advocating a national railway across the continent from one shore to the other! In May, 1869, only 38 years later, Professor Low might have been justified in dismissing the other professors. In September, 1869, the first railroad car passed direct from New York to San Francisco. This was a Pullman Palace car, a wonderful and magnificent innovation on our roads. Since then, hotel cars have made the trip, each more comfortable than the preceding; and improvements have been added until one wonders what is to come next. Certainly Mr. George M. Pullman must have a quick brain to devise, and

ble everywhere, is Mr. George M. Pullman, from whom the company gets its name. Mr. Pullman, by the way, awards to California the prize for superiority in wood suitable for car-building. He has in his office a collection of sample woods from the Pacific Coast, the names of which I send you. Those in italics are California Coast woods:

Oregon Ash (very well liked), *Abazo Vena, Primavera, Ebony, Aquilado, Coffee Wood, Alaska Cedar, Male Linola, Female Linola, Cabo de Hacho, Cal. Beach, Redwood, Colorado Lona, Tecomate, Mountain Mahogany, Oregon Cedar, Blood Wood, Lanco Wood, Lower Coast Ebony, Tiger Wood, Chilillo, Campeche, Lena Turte, Temisquito.*

Connected with the offices is the manufactory of hedding, mattresses, etc., for the cars. Spring mattresses, among other things, are furnished here. The supply rooms look like huge wholesale grocery, glass and hardware establishments. Everything is of the best, the handsomest and the neatest.

The Cars.

The company is ready to furnish excursion parties with cars to San Francisco or elsewhere. For a regular sleeping car with 28 berths, or a drawing room car which can be converted at night into a sleeping car with 26 berths, with conductor and porter, a charge is made of \$75 daily. For a hotel

car with kitchen fully equipped and with conductor, cook and two waiters, the charge is \$85 daily.

Everything in the cars is most elegant and comfortable. Between New York and Chicago, sleeping cars are run which are *lighted with gas*, the arrangements for this being perfect. I came on over the Union Pacific to Omaha and on the Burlington route to Chicago in the Pullman cars, and I assure you that it was grand.

In the dining cars more could not be wished. The choicest of food on tables covered with spotless linen and garnished with the finest of silver services, the best of waiters and, if you can afford it, really good wines, incline one to do full justice to the appetite acquired from the bracing air of mountain or plain. I could hardly realize that I was the same fellow who roughed it across the plains in an ox-cart, years ago.

But I cannot dilate longer on this subject and must conclude with my thanks to the officers of the company for the many kind attentions shown me.

Filing Saws.

(Written for the Press.)

EDITOR PRESS:—In an old number of the SCIENTIFIC PRESS appeared an item headed "How to File a Saw." Now, there is one little difficulty that I have always encountered, that "How to File a Saw" did not enlighten me upon,—and that is this: It frequently happens that the teeth upon one side not only get larger (a thing easily remedied), but smaller in every way. In endeavoring to file the back side of the large tooth in a cross-cut saw, the file is liable to over-ride, so as to damage the next tooth forward. To prevent this, for a long time I was accustomed to hold my thumb-nail close to the file, so that it would stop it whenever the tendency to over-ride carried the tool over the top of the tooth; but in so doing, although the forward tooth was protected, it was at the expense of an occasional sore thumb; until it occurred to me to substitute a soft piece of iron that would receive the file, if it slipped over, and so protect the small tooth from damage and make the tool do its work upon the large one. The foregoing hints may be of use to those who have encountered the difficulty mentioned in saw-filing. F. M. S.

San Diego South, Jan. 22, 1871.

THE BLUE LAKE MONSTER.—"Ink Stand" writes to the *Healdsburg Flag* that he has actually seen this rather mythological inhabitant of the Blue Lakes of Lake county, and is going to make it a point to ascertain just what it is. We hope he will succeed. He says: I caught a glimpse of him swimming near the opposite shore, a distance of some 400 yards from me. I stopped the team to get a good look at him. I should think he would measure at least twenty feet in length and five or six feet around the body. The Indians hereabouts have the superstition that a sight of this monster devil fish, as they call him, is certain death to them. They will not fish in the lake he inhabits, the upper Blue Lake. I refused to believe this big fish story until convinced by the evidence of my own eyes. I find my incredulity gone but am unable to say what this huge creaturo is.

A COLORADO AMALGAMATOR.—The Colorado Herald thus describes an amalgamator, designed for taking the flow from stamp mills and by forcing it through quicksilver ensure the amalgamation of all free particles of fine gold. The bed of the machine has two half cylinders somewhat like Hungarian bowls. In these revolve very slowly two fluted wooden cylinders. The arms made by these flutings force the pulp through the charge of quicksilver, which is placed in the bowls. No quicksilver is used in the batteries. It is claimed that in this way all of the pulp must pass through the quicksilver and that perfect amalgamation thereby ensues. We hope some one will give it a trial. It is called the Euroka amalgamator.

NEVADA COAL.—In a few weeks, at most, says the *Elko Independent*, of Jan. 25th, will demonstrate the fact whether Elko county boasts a first-class coal mine or not. The probabilities are all on one side, and the indications are that the bed is not only extensive, but of a very superior quality. This will give us another source of wealth as well as filling the pockets of the fortunate owners.

MINING SUMMARY.

The following information is gleaned mostly from journals published in the interior, in close proximity to the mines mentioned.

California.

ALPINE COUNTY.

ITEMS.—*Miner*, January 28th: A vein struck in the south drift of the Globe this week yields a fair quantity of good ore. Steam is on at the Globe Mill and it is expected that work will begin in ten or twelve days. The ore dump of their C & D mine is growing daily. The finest specimens of ore ever found in Alpine, have been lately taken from the Schenectady mine and sent to New York. Native silver could be plainly seen.

AMADOR COUNTY.

SUTTER CANAL.—The *Ledger* of February 4th says this is finished to near the junction with the Butte Canal, and will in a few days afford a considerable supply of water. A large extent of mining ground hitherto untouched, will now be worked, and the fine foot-hill lands be cultivated with profit. The next thing we want is a narrow gauge railroad along the divide to the inexhaustible timber forests above us.

VOLCANO.—Just now, mining is very dull, owing to the scarcity of water—there being none to be had on the north side of the town where there are a number of rich claims. On the "Flat" a number of claims are paying.

RICH.—Marklee and Nichols of the Alturas (Marklee) mine, have made another rich strike in a new location, two miles north of Volcano. The shaft is only down thirty feet with a vein of ore from two to three feet in width, and so rich is the rock that they are sacking it as fast as it comes out of the ground; scarcely a piece can be found that does not show free gold.

BUTTE COUNTY.

CHEROKEE.—Chico *Enterprise*, Feb. 4th: The new Ditch Co. have entirely succeeded. Employment is now given to hundreds where a short time since a few only found work. The Cherokee Co. will next summer add another ditch and swarm the Flat and surrounding hills.

CALAVERAS COUNTY.

GRAVEL MINING.—Paul & Co., below the Junction, are working twenty hands and meeting with fair success. Their tunnel is over half a mile in length, a good portion through solid bedrock. At the What Cheer everything is progressing favorably. The incline is pushed as rapidly as possible, and the channel will be reached within five months at farthest. Shaw's hydraulic is not in operation. He will "go after" Stockton ridge again, shortly. Brackett & Co's cement mill is in full blast, and the batteries clean up well. The Frenchmen who purchased the old Paul claim in Chibi Gulch, have been working the mine successfully ever since. Champion, Boughton & Co., in Corral Flat, are sinking a new shaft, having worked out all the pay gravel in the vicinity of their old one. Megaw & Co., on the western side of Stockton Hill, have run about a mile of tunnel, sunk shafts and "drifted" in every direction in search of the "lead." At Sport Hill the hydraulic and tunnel claims are all being worked again since the rains.

PALOMO.—The thirty-six stamps are crushing eighty tons of rock every twenty-four hours. At the depth of four hundred feet the sinking has been discontinued and all the hands, some forty, are "stopping out." When we state that \$2 per ton will cover the expense of mining and milling, and that the rock averages \$10, any one can figure whether the mine is paying. Alexander & Co., are pushing ahead with favorable results. Lower Rich Gulch is the liveliest precinct in the county.

THE "BIG MINE."—We understand that the quartz lode near Railroad Flat, conditionally sold to parties in San Francisco, by the Lewis Bros., is turning out splendidly. The lead is widening and the rock is very rich.

INYO COUNTY.

ECLIPSE.—*Independent*, Jan. 28th:—Surveys have been made from the mill to a point on the river nine miles above, with a view of bringing water in to propel the machinery. Some 7 tons of extremely rich ore from the new strike are ready for shipment to England. The assays average \$1,898 per ton, with more on the dump, and plenty in sight. It is probable that the company will erect smelting works.

LEAD.—White and Williams, in the Buena Vista tunnel, now in 400 feet, struck a large body of solid galena last week.

BELMONT MINE.—Last week the lower tunnel was in 600 feet. The rock was soft enough to make good headway. In the same tunnel, 370 feet from the mouth, the

miners struck a ledge 2 feet in thickness, and will start a drift on it this week.

ITEMS.—The tunnel on the Wittekind is in 170 feet, and the rock is softer. The Osceola Co. are in 200 feet, but have not yet reached the ledge. Belshaw's furnace is running out stacks of silver-lead bars. The Crowning Glory is taking out good ore. White & Co., contractors on the Kearsarge tunnel, have nearly completed the work, and the ditch and water wheel are progressing favorably. Two teams with nearly 48,000 pounds of ore from the mine at Hot Springs for the Swansea furnace, passed through town on Tuesday.

The Lone Pine correspondent of the same says that Cerro Gordo produces from one furnace alone, more than 1,200,000 pounds of lead hulsion yearly, and could do much better if there were means of shipping it.

LASSEN COUNTY.

BIG VALLEY.—The *Yreka Journal* of Feb. 1st says that suit has been brought against Haskins, Ehlers & Co., of Providence Hill, for the quartz ledge underlying their claim, and \$100,000 damages, by parties who discovered the ledge outside of their lines; H. & Co., having first entered it as a placer claim.

The *Union* of same date says that these parties are from Virginia City, Nev., and that they do not deny the right of H. & Co., to work off the decomposed quartz down to the solid ledge. The *Union* learns also that four distinct and well defined ledges have been discovered on the hill. A large number of persons are engaged prospecting in the vicinity.

NEVADA COUNTY.

RICH.—*Transcript*, Feb. 1st: Dr. Esmond has been for a year past running a tunnel under the bed of the South Yuba river, at Washington. He has spent several thousand dollars, and of late has been considerably downcast. Last Friday a boulder was struck which filled the entire tunnel, and nearly the whole day was consumed in blasting through it. When the last shot had been fired, and the fragments of the boulder removed, nuggets of gold, varying in weight from a bit to an ounce and a half were plainly to be seen on the bed rock, while a fine body of gravel showed itself, which has since been found to be thirty feet wide and six feet high. Forty-six ounces or nearly four pounds of coarse gold were picked up in about a half hour. The Dr. feels better.

RISEING STAR MINE.—*Gazette*, Feb. 2d: The old Sogg's mill is crushing 200 tons of rock from the Rising Star, formerly known as the Wyoming. Rock from this ledge was crushed as early as 1853. It has yielded \$68 a ton, and never less than \$23. The owners are A. H. Hagadorn, John Peard, H. McCauley, and J. Keehan. Some of the specimens taken out lately will rank among the richest we have seen in Nevada County.

DEER CREEK.—Between Sogg's mill and Newtown, four miles, there are twelve companies at work. These own nearly the entire bed of Deer creek for 20,000 feet. The Big Derrick Company is owned and worked by Chinamen; all the others by white men.

MILL AND MINE LEASED.—Same of 3d: We are informed that the Nevada Quartz Mining property, (Sogg's,) has been leased for three years to parties in San Francisco. The ledge is from five to fifteen feet in thickness, and has never been worked below the water level.

HYDRAULIC.—E. Williams is running two sets of hydraulic claims at You Bet, and Niece & West have commenced piping. Mr. Williams has 650 inches of water in his ditch.

THE MINING SITUATION.—*Grass Valley Union*, Feb. 3d: The Eureka has continued its steady yield, amounting to over \$2,000 per day from the mill, with extensive savings of rich sulphurets. The works underground are in splendid order, and there is ore in sight for three or four years. Perrin's mine will soon be well opened for two or three years' work. South Star rock is looking well. North Star pays over expenses. The English Co. which now owns the Grass V. Consolidated (O'Connor), will immediately open up the mine in scientific style. Landis & Black, of Goshen Hill, will get through with their long tunnel within a week. Goshen Hill is filled from top to bottom with gravel which will pay by hydraulic. On the bed rock the deposit is very rich. The New York Hill mine is soon to be reopened. Coe has stopped for repairs. Webster & Co's gravel claims are being worked successfully. Town Talk mill yields well. The Co. talk of putting up a steam engine. Red Jacket claims are worked in good shape.

PLACER COUNTY.

SHIPLEY MINE.—*Herald*, Feb. 4: This mine and mill belonging to McFadden & Sears, is now incorporated and the stock placed at \$500,000. There are a number of shafts on the two ledges, the Shipley and Trouble, and the main one is down eighty feet, with a draft forty feet, showing rich quartz all the way. Early in the week the workmen struck on some boulder quartz which was exceedingly rich.

BUCKEYE.—This mine is having seventy tons of quartz crushed at the Empire mill, which we were told, would yield \$100 per ton.

EMIGRANT GAP.—Joseph Hoaglan & Co., discovered a ledge two miles south-west of Emigrant Gap. When down twenty feet, the Co. shipped two and a-half tons of ore to Colfax which yielded \$14 per ton in free gold and \$11 in the sulphurets, making \$25 per ton in all. The ledge is four to six feet thick and well defined.

COLFAX.—Cor. of same: The Montana raised steam last week to test their machinery and it worked like a charm. This Co. are erecting a 10-stamp battery. The "Lafayette" has been taking out rock lately which prospects well. The "Colfax" has a pile of 30 tons on dump ready to be taken to mill.

OPHIR.—*Stars & Stripes*, Feb. 2d: We are informed that the St. Patrick Co. is working in rock which will yield over one hundred dollars per ton. Twenty-six tons from the Black Jack ledge crushed at the Empire mill yielded over forty-nine ounces of gold, or about eight hundred dollars. At the same mill they are now on a lot of seventy tons, from the Buckeye which is considered safe for seventy dollars per ton.

MICHIGAN BLUFF.—The Weske claim, on Turkey Hill, which yielded so enormously last year, has again commenced making generous returns. During the week ending Jan. 21st, it yielded over one thousand dollars, and during the next, seven hundred. The running expenses were less than one hundred and fifty dollars per week.

RATTLESNAKE BAR.—Cor. of same: The miners are commencing to wash, for the first time this season. Boles, Cray & Co., are washing and B. W. Houseworth & Co., commence to-day with the new pipe on the Wild Goose claims. Those claims with small heads of water and little pressure, were remunerative. With this extra pressure—60 feet—they will certainly be more profitable. There is not yet water enough to supply all.

PLUMAS COUNTY.

GOOD YIELD.—*Quincy National*, Jan. 28: The Deadwood Co. at Elizabethtown, for two men's work, two days last week, panned out about \$280.

SAN DIEGO COUNTY.

OUR MINES.—*Union*, Feb. 2d: We learn that the yield from the mines in the Julian and Banner districts is larger than since the discovery. Four 10-stamp mills are running.

The McMechan mill, since it was moved into San Felipe cañon has been doing good work. The Stonewall Jackson mill is running steadily on good ore.

SHASTA COUNTY.

THE SEASON.—*Courier*, Feb. 4: The last month of Winter is at hand, and the mining season is a comparative failure, the owners of many placer claims not having had water enough, so far, to enable them to even commence sluicing. Some have had enough water to enable them to run for a few weeks, at a great disadvantage. The few miners whose claims are under ditches from living streams, such as Clear Creek and Cottowood, have generally done well.

SIERRA COUNTY.

ITEMS.—*Messenger*, Feb. 4: The Independence mine has again been started. Arrangements have been made by which money was obtained to pay off the hands. The Hog Cañon mine is in the hands of Silverman & Co. We are informed that they have already got men at work and will soon have things in order. We learn that Spencer & Co. propose to purchase the Chips' mine, and place upon it the machinery now at Gold Valley.

ITEMS.—*Democrat*, Feb. 2d: J. K. Code, of the Oro mine, crushed some rock from that ledge last week in a band-mortal and got a good prospect. The indications are that they are near the rich chimney on which the first work was done. The two 16-stamp mills and twenty stamps in the new mill at Reis mine are in operation. Fred Wehe has sold his interest in the Wehe Ledge to Henry Kruse.

TRINITY COUNTY.

ITEMS.—*Journal*, Feb. 4th: In Oregon Gulch all are at work with an average supply of water. Among the best claims are those of Slattery Bros., Donovan & Conda.

Cleary & McCarthy. The former employ six Chinamen, and are running day and night. Several companies at Junction City have given up hopes of water this season and gone to drifting. Taylor's Flat miners are ready for work, but have no water. John Franklin has found good diggings on Cañon Creek, just below McGillivray's dam. At Douglass City, Mason, Marshale & Co. are in 100 feet with their tunnel. The claims about Douglass are all working.

Nevada.

COPE DISTRICT.

ITEMS.—Owyhee *Avalanche*, Jan 28:—The boiler and engine for the Argenta hoisting works have arrived. The new shaft is down seventy feet. Vance's mill is running on Bull Run ore. Norton's mill has been crushing Excelsior rock, and small lots from various ledges. The Blue Jacket mine at Bull Run has been sold to an English Co. for \$20,000.

ELY DISTRICT.

BULLION.—The *Record* of Jan 29th says:—The Meadow Valley alone sent from Pioche during December, 1870, \$151,675; \$7,000 less than all the companies combined shipped from White Pine County during the same month—their shipment amounting to \$158,000. The Burke, Creole, Rutherford & Hanchett and others, all produce bullion in the same proportion.

EUREKA DISTRICT.

FINE BULLION.—*Sentinel*, Feb. 4th: Ogdun, Dunne & Co. have for days together run out bullion of a value above \$500 to the ton, and on Tuesday last they produced some tons that assayed \$1,051.

TAYLOR'S SILVER WEST.—This new furnace is about ready to run. It has been fired up to dry the lining for some days.

HUMBOLDT.

The *Silver State* of Feb 4th learns that a very rich and extensive vein of ore was developed on Thursday in the De Soto mine.

The Elko *Independent* of the 4th says a contract has been made with the owners of the Cosmopolitan mine, in Bloody canyon, rich in antimony, to deliver to a San Francisco Co. at Mill City, 50 tons of ore per month, at \$25 per ton. The mine will produce an unlimited amount of that ore.

REESE RIVER.

BULLION.—*Reveille*, Feb. 4th:—During January there were shipped through Wells, Fargo & Co. 87 hars of silver bullion weighing 6,841 pounds, of the value of \$92,017 21.

BULLION FROM MONTEZUMA.—Mr. McGlewin arrived yesterday bringing 11 bars of silver bullion, of the value of \$7,000.

WASHOE.

SUCCESS.—*Enterprise*, Feb. 5th. The mine is half a mile north of Silver City; and is in a most prosperous condition. The ores are run directly from the tunnel into the mill. Although an "outside" mine, the day is not distant when it will rank among the foremost.

HALE AND NORCROSS.—In this mine they are laying a sill floor in the eighth level and breasting out the ore between this and the seventh. Two hundred and thirty tons of ore is the present daily product, thirty of which is from the upper mine.

SAVAGE.—This is producing 135 tons per day from the sixth, seventh and eighth levels. Many prospecting drifts for reopening the old levels are being prosecuted.

CROWN POINT.—The raise upon the new ore body on the 1,100 foot level is up 100 feet, and is still in fine ore.

BELCHER.—The receipts for the past year were \$278,541, including \$204,253 from bullion, and \$72,695 from assessments. The expenses were \$377,917—the leading items being \$123,214 for crushing ores, and \$85,388 for labor, leaving \$624 cash on hand. During the year the amount of ore crushed was 11,353 tons, yielding an average of \$17 99 at a cost of \$10 85 per ton.

VIRGINIA CONSOLIDATED.—In this mine the northwest drift is in 195 feet and has cut the east clay of the vein.

CHOLLAR POTOMI.—During the week they have extracted 1,500 tons of ore, 1,450 of which have been sent to the mills. The average assays have been \$69 10.

SIERRA NEVADA.—About the usual ore is being reduced at the mill of the company and the Berry & Evans mill. The old Sacramento mill is about starting up on Sierra Nevada ore.

OPHIR.—The operations are principally confined to the development of the southern part of the mine. Good progress is being made in the "up-rise."

BUCKEYE.—The Franklin mill, on Carsou River, is crushing 18 to 20 tons of ore per day for the company. The ore is taken out at the depth of 130 feet.

YELLOW JACKET.—The main shaft is being sunk for a new level. The drifts on

the two lower levels have as yet cut no ore. SEGREGATED BELCHER.—But little work is being done. A large amount of ore lies upon the dump and there are a few men engaged in running prospecting drifts. GOULD AND CURRY.—There is about the usual yield of ore from the old levels. A good deal of prospecting is being done. SUTRO TUNNEL.—The tunnel was in yesterday 1,810 feet. It is in hard green stone, and the face of the tunnel is quite wet.

OVERMAN.—About the usual ore is being taken. The legal troubles with the Calcedonia have not yet been settled. HOPE.—The mine is keeping the mill in constant operation. They have about the usual flow of water in their lower workings. DANNEY.—The drift from the engine shaft is in fifty-three and a half feet. The rock is becoming softer. All the machinery is working well.

WHITE PINE. We have space this week for only a brief extract from the "Review" of the *News of Feb. 4th*: The same general activity in the extraction and reduction of our milling ores is maintained; yet many mines on the Hill of much worth, are as yet idle. Of this class holding good milling ore, we note the Potts, Auburn, Addington and others, while Blue Hill furnishes the Uncle Sam, Westford, Cactus, Domingue and Bower & Brown. The Truckee has for six months rewarded its prospector with ores of the first-class, milling \$200 per ton, and its second upwards of \$100. The Bullion Hill mines—rich and extensive, are disgracefully inactive: The mines contiguous to Gov. Blasdel's mills, if worked with energy, would be sufficient to supply those silent works. The Minnesota has given assays of \$10,000 per ton; but the weakness or indifference of its owners has paralyzed its working.

Arizona. BRADSHAW DISTRICT.—Prescott *Miner*, Jan. 28: Parties just returned agree in pronouncing it the richest district ever seen. A party arrived in town Thursday from Bradshaw, with several sacks of ore from a recently discovered silver ledge, said to be of immense size and richness. Messrs. Head and Hammond, informed us that very rich gold ore was being taken out of the Del Pasco and other lodes. About 20 men were engaged in placer mining, and making fair wages.

ITEMS.—The Davis lode, in Hassayampa, assays largely in both gold and silver. The owners talk of trying a few tons of ore at the Chase mill.... On Lynx Creek, Uncle Billy Pointer and C. Y. Shelton, are pursuing work with results quite flattering. Shelton is negotiating for the purchase of the Eureka mill.... The Big Bug mill is running on good ore. The Eugenie pays regularly.... The Vulture mill is running as usual, and the aspect of mining matters is bright.

Colorado. ITEMS.—Central City *Register*, Jan. 18th: Hinds, Helmer & Co. are working the Trojan lode, Grand Island. At a depth of 70 feet they have eight inches to a foot of ore, partly decomposed, which yields by assay \$200, coin, per ton.... The Dallas lode is paying well. Lynn & Co. are working it under a lease from Germain Bros. Their mill ore yields six ounces per cord, besides which they are taking out considerable galena to be sold to the Western Smelting Co.

THREE PANS OF DIRT.—The *Tribune* publishes a letter from Ben. Barnard, Oro City, Lake county, dated Jan. 14th: "I washed out from one pan of dirt from the Pilot lode, 48 ounces and 18 pennyweights of gold. On the 9th I washed from two pans, 104 ounces—the three pans averaging a little over 50 ounces each. On the tenth I washed from one pan a little over 16 ounces. We had several nuggets in the lot. One weighed 14 ounces."

GRAND ISLAND.—*Register*, Feb. 1st: An assay by Mr. Burlingame of average ore from the Shamrock lode, gave six ounces gold, and 21 ounces silver. This is a recent discovery, and the ore came from fifteen feet below the surface.

THE GEORGETOWN correspondent of same says the ore now found on the east slope of Leavenworth Mountain is immensely rich. The richest veins are but a few inches thick, but they yield as high as 1,300 ounces per ton.

NEVADA DISTRICT.—*Herald* of Jan. 28th: Charles Hagar is taking ore from the Monitor lode which runs \$224 to the cord. On the California Stalker's claim is yielding well, as is the Collins & Mackay. C. S. Jones is working his new discovery, supposed to be an extension of the Kansas. His quartz has yielded 7 ounces and is improving.

GEORGETOWN.—*Miner*, Jan. 26: A large deposit of very rich ore has been struck in the Snow Drift mine. The ore assays from \$500 to \$1,500 per ton in coin.... The Cashier mine shows a solid breadth of crevice material, argenteiferous galena, of sixteen inches, carrying one hundred ounces in silver per ton and fifty per cent. of lead.... One ton and a half of ore from the E. Plumbus Unum lode, give a net profit of \$358 per ton.

GOLD SHIPMENTS.—The *Herald* says the amount for December from Gilpin county was \$73,000 coin. For the year 1870, \$1,210,625. The report from Clear Creek county, for 1870, of bullion produced and ore shipped, is \$415,066.

Idaho. ITEMS.—*Avalanche*, Jan. 21: The new steam hoisting works at the Chariot mine are in operation.... The foundation at the Peck & Porter for the old Chariot hoisting works is completed; the machinery is on the ground and will be in working order by the latter part of next week.... It is reported by those who know, that the Rising Star will start up next spring.... Wells, Fargo & Co., shipped from here last week 19 bars of bullion, valued at \$49,317.

NORTHERN IDAHO.—A correspondent writes the *Walla Walla Union* of Jan. 14th from Warren's Diggings, that the Rescue Co. have struck ore that will yield a thousand dollars to the ton. The mine is worked night and day—over one hundred tons are ready for reduction. The mill however is a wretched affair. Sanders & Co. are getting out very rich ore from the "Key-stone" mine. They crush by arrastra. Several other mines will be worked next summer. We know now that we have immense quantities of good ore, but lack the proper means for reducing it.

The Boise City *News* of Jan. 28th, says the prospects are favorable that there will be an abundance of snow in the mountains for mining purposes this spring. It has been falling heavily for several hours, north.

Montana. LINCOLN GULCH.—Cor. of Deer Lodge *Independent*, Jan. 28:—Lingnest & Co., and Adams & Co., are working regularly. The Lincoln Drain Co., are blocking out their ground, and Hathaway & Co., are preparing for spring operations. Sour Kraut has proved a success. The 1st Drain Co., have been washing all winter; the 2d Drain Co., will be fairly washing by the middle of February; the 3d Drain is pushed vigorously; the 4th are ready to commenced drifting from their open cut, which is now ten feet deep. That Sour Kraut will pay for a distance of six miles, is considered certain.

WHITLATCH MILL.—*Helena Gazette*, Jan. 30:—McClure & Sanderfer yesterday made a clean-up of 293 ounces of gold at Unionville, from eleven days' run on quartz from their mine.

VIRGINIA CITY.—The Oro Cache mill is running day and night on \$45 ore. Their tunnel is in 400 feet on the lode and the crevice is three feet wide. Brown's Gulch mill, also under John How, is running day and night on \$25 quartz.

PROSPECTS FOR 1871.—The *Mountainian* says the year opens well. Things have a more permanent look. Mines worthless a year ago are now valuable. Abandoned districts have been proved rich by a few hard workers. Farmers too, are better posted, and hopeful. People act now as if they had come to stay.

FOREST CITY.—Cor. of Missoula *Pioneer*, Jan. 26:—Only four claims are yielding pay dirt now. Two of these, 56 and 57, are washing; the others, 61 and 62, are dumping to wash in the spring.

New Mexico. CIENEGA.—The Cor. of the *Santa Fé Post* of Jan. 21st gives a long list of New York assays of ores from these mines, in Southern New Mexico. The lowest is \$81 per ton, and the highest \$8,100.

Oregon. EAGLE CREEK.—The editor of the *Mountain Democrat* says that there is a terrific excitement raging in regard to the "diggings" and the new ditch about to be constructed.

Utah. THE EMMA.—The *Colorado Herald* of Jan. 21st gives the price paid for three-fourths of this mine by W. B. Lent & Son and others of San Francisco as \$900,000 gold. Warren Hussey, the owner of the remaining fourth, declines to sell.

A BEAUTIFUL SIGHT is the single stem of an orange tree on exhibition at the Odd Fellows Library in this city. This stem was recently taken from a tree grown by Paul Kearns, of Los Angeles and contains seventy-five full grown oranges.

Mining Stocks. SAN FRANCISCO, Thursday Eve., Feb. 9. The Mining Share Market has been quite brisk during the past week, the most prominent facts being the advance in Belcher and Crown Point. The former reached \$15.75, the highest point it has attained for many months. Amador has been quoted twice at \$305, and Enreka twice, at \$76 and \$75. Gould and Curry declined considerably, as also Savage.

The following table gives last Thursday's quotations compared with to-day's, and the highest and lowest points reached by the several descriptions of stock,

New Incorporations.

The following have filed certificates with the County Clerk, San Francisco.

RAILROAD M. Co., Sutter Creek, Cal.—Feb. 1. Capital Stock, \$600,000. Trustees: D. D. Cotton, M. S. Latham and R. C. Harrison.

PROCE S. M. Co., Nevada.—Feb. 1. Capital Stock, \$2,000,000. Trustees: A. H. Rutherford, G. W. Rutherford, A. Hayward, J. D. Fry and C. N. Felton.

INDEPENDENT G. M. Co., Butte County.—Feb. 8. Capital Stock, \$250,000 in 20,000 shares. Trustees: J. F. Dinn, J. P. Thompson, C. Swift, W. Blackwood and J. S. Pond.

The following have filed certificates with the County Clerk, Sacramento.

NAPA COAL M. Co.—Feb. 3. Capital Stock, \$3,000,000 in 30,000 shares. Trustees: W. C. S. Smith, G. N. Cornwall, W. R. Brown, E. N. Boynton and J. Mudgett.

Meetings—Elections.

CHEROKEE FLAT BLUE GRAVEL CO.—Feb. 4. Trustees: A. Caselli, O. P. Sutton, H. Kozminsky, J. Bandmann and G. E. Rogers.

LATAWANA M. Co.—Trustees: J. H. Wise (President), J. A. Drinkhouse (Treasurer), E. W. McKinstry, P. Conklin, M. M. Baldwin, G. Southwell and G. A. Harris. Secretary, A. Martison.

CAL. POWDER WORKS CO.—Trustees: J. H. Baird (President), J. B. Haggin, N. G. Kittle, J. O. Earl and G. B. Lawton.

IMPROVED BEE-HIVE.—J. R. A. Williams, Colnsa, Cal. Mr. Williams has invented a hive which will tend greatly to improve the health of the bee, and afford protection against its enemies. For this purpose, the hive is so constructed as to secure perfect ventilation of every portion of the hive, where ventilation is necessary, and the entrance is so arranged as to provide against the inroads of the bee-moth or miller. These important objects are secured in a simple but ingenious manner, and advantages obtained thereby are such as to recommend the device to all lovers of sweets and persons owning apiaries.

CALIFORNIA WINES FOR CHINA.—Mr. Bigbey, shipped by the last China steamer 23 cases of his wines to Shanghai.

A GOON ACCOMMODATION.—The C. P. R. R. has lately attached a sleeping car to the freight trains between Sacramento and San Francisco, leaving each place in the evening. Passengers report it very satisfactory as they lose no time and arrive fresh for business or pleasure.

INDUSTRIAL MISCELLANY.

Reclaiming Alkaline Soils.

There are few agricultural districts in this State, or on this coast, where there cannot be found tracts of alkaline soils. In some places it will show itself in the salt-grass and weeds peculiar to such soils; in others it may be seen glistening like frost upon the surface, or blackening the water that settles upon it. In no one thing does the soil of this coast differ from that of the Eastern States, more than in its superabundance of these salts. There the soils are generally too acid, while here too much alkaline matter is frequently found. Our alkali would be good manure for many eastern farmers; while if we could get their sour, swamp soil, rich in vegetable mould, it would be just the thing to mix with our saline soils.

The various cheap compositions of lime, soda, and potash, make the best manures for the sour Eastern soils; while on our soils, already too full of such salts, they would be an injury, instead of a benefit to growing crops.

The plowing under, and plowing in, of straw, strawy manure and grain crops, will tend to correct the surplus alkaline matter in our soils, by absorbing, and through chemical decomposition, neutralizing the active principles that are injurious to growing crops; as also in making light and porous such soils as have become compact, by settling in low places.

In such places as can be flooded with water; where the water, after dissolving the alkaline salts, will readily drain off, such washing, is one of the best means that can be taken to get the surplus salts out of the soil.

Where the strata of alluvium containing the surplus salts is shallow or thin, this method will succeed admirably; while the plowing in of manure and green crops, with a cultivation of beets or some crop which absorbs the salts, will reclaim the land.

But where the strata of alkaline alluvium is deep, and the alkali is constantly rising to the surface, and being deposited, through capillary action and evaporation, there is something else necessary to be done to avoid it.

A thorough system of deep underdrainage will accomplish much towards such an end. The alkali from beneath will rise only as high as the underdrainage, and flow away with the water which holds it in solution. By such action the surface soil will soon lose its alkali, and, with proper tillage, become very valuable.

Our alkaline soils—now comparatively valueless—when once fairly reclaimed, make the richest and most productive tracts when rightly handled. The "mystery of farming" ceases to be a mystery when intelligently comprehended and understood. If the "power of mind over matter" was as fully realized in agriculture as it is in mechanics,—and the time is coming when it will be,—successful cultivation would be no stranger than successful engineering.

RAILROADS VS. FENCES.—The question as to whether railroad companies, were compelled to build fences along the line of their road and keep them in order to prevent the killing of stock along said line, has repeatedly been before our courts; but, until very recently, there has been no definite construction of the law given. We see in the case of McCoy vs. the California Pacific Railroad Company, the Supreme Court has decided that a railroad company is bound to build fences along the line of the road, and that in the absence of such fences they (the company) are responsible for the live stock they kill on the track. This is one of the most important decisions yet rendered by the Supreme Court of this State in the interest of farmers and stock-raisers, and more particularly does this decision beneficially apply to parties resident upon the lines of railroad.

A New Silk Project.

We have been shown a letter wherein a tract of some 3,000 acres of land, at the Mission San Jose, is offered for sale at \$400,000; the project being for the establishment there of an extensive silk producing and silk manufacturing establishment. The mover in this matter is Joseph Newman, the pioneer silk manufacturer of this state, who proposes to organize a company to make the purchase, and start the operation, which will be conducted on the co-operative plan.

Mr. Newman assures us that quite a number of capitalists have already expressed their willingness to take hold of the enterprise, and he feels confident that he shall soon be able to secure the additional amount required to place the scheme in a shape to commence operations.

The capital stock proposed is \$500,000, in shares of \$100 each, giving \$100,000 for a working capital. The plan is to purchase the above mentioned tract, to build tenements on the same for the benefit of the operatives employed, and to charge such rents as will be convenient for both capital and labor. Members will be entitled to hold as many shares as they want, but with limited rights of voting, as follows:—The holder of one share, one vote, three shares, two votes, five shares, three votes, and each additional five shares, one vote. The stock will have to be paid in full, in small monthly or quarterly installments.

Each operative at the factory, after found competent by the General Superintendent, must become a shareholder of the company. Operatives who occupy tenements for three or five successive years, and pay rent for the same will be entitled to a free deed.

In order to secure experienced and reliable labor it is proposed to set aside \$25,000, for the purpose of helping to this state such emigrants as may be needed, the amount advanced to them to be deducted from their wages in small monthly installments.

Apprentices, of both sexes will be taken, who, after serving their time, will be entitled, in addition to their regular wages, to two or three shares of the stock, according to the time and nature of service.

It is proposed that the company shall plant, buy, and sell everything connected with the silk interests, and manufacture silk in all its branches in conformity with the demands of the market, solely from California cocoons, or raw silk raised and reeled in California. If it goes into operation, 200,000 mulberry trees will be planted the present season.

No more opportune time than the present, has ever been presented for inaugurating such an enterprise. The recent advance in the price of silks, growing out of the European war, will probably be kept up for many years. Mulberry trees can now be had in this state, at a very low figure. The eggs being no longer in demand. Silk worm raisers in this state must this year turn their attention exclusively to raising cocoons, which will be furnished cheap to any establishment that may have the means of utilizing them. Moreover, the stoppage of the silk looms of France has closed a large market for raw silk, which will now seek purchasers nearer home and at greatly reduced prices.

Such advantages, coupled with the superior economy and efficiency of the co-operative system of labour, and the plan proposed of securing a proper proportion of skilled labor from abroad, ought, with proper management, to make the projected enterprise a paying one. If successful it would prove of immense benefit to the state at large in furnishing a ready, home market for the immense number of cocoons which must hereafter be produced here, and in giving a practical start to an industry which, fairly inaugurated, will furnish full employment, not only to our present population, but to any number of future millions which may hereafter be attracted to the Pacific coast.

Pacific Coast Industry.

The record of exports from this city shows, most unmistakably, that the general industry of the Pacific Coast is in a prosperous condition. The sum total of the products of our industry, aside from the precious metals, is considerably in excess of \$20,000,000. That of this State alone reaches very near or quite to that amount.

Our exports of wheat for the year 1870, were within a small fraction of \$8,000,000 in value. Though something less than last year, the larger surplus holding over, and the advanced price which it commands, will bring it fully up to last year's figure. Had the season been favorable there would have been quite a large excess.

Our wool product makes a still better proportional exhibit. The yield has increased from 897,938 pounds in 1866, to 3,655,000 pounds for 1870. This is surely most satisfactory progress. Some important facts and suggestions, with regard to this great industry, will be found in another column of our present issue.

Our leather interest presents an almost equally satisfactory exhibit. Although its increase may not be so rapid, its progress is healthy and highly creditable to the State. California leather takes the highest rank in the Eastern States, commands the highest price in the market, and has always a ready sale. One manufacturing house exported 100 tons of leather during six months, only, of the past year.

The general manufacturing industry of the State is steadily progressing in importance and value.

The Pacific Rolling Mill of this city has added the rolling of railroad iron to its other operations, and has taken a contract to furnish a large portion of the iron for a 25-mile section of the Northern Pacific Railroad.

The San Francisco Smelting Works, owned by our worthy Mayor, T. H. Selby, in company with an Eastern party, is doing a very large and profitable business; is working up the "mrtte" from our "baso metal mines." Large quantities of barlead, lead pipe and shot, not required for consumption here, is being shipped East.

Our woollen manufactures are also doing a thriving business and answering large orders from the East.

More than half of all the boots and shoes worn on this coast are now made here; while five years ago more than four-fifths of our supply was obtained from the East. Many minor manufacturing interests—large in the aggregate—have also become well established among us, and others are being constantly introduced. Mr. Strong, an experienced cotton planter from the South, is making preparation to enter largely into the culture of cotton in this state, where he believes the middling grades of that textile can be grown more advantageously than in the so-called cotton states. If his experiment succeeds a new industry of magnificent proportions will be opened up to the state.

The culture and manufacture of silk is becoming more and more promising, and there is every reason to believe that we shall soon be producing silk in considerable quantity, from California cocoons. Arrangements are now in progress which will result in the introduction here of a few skilled operatives from abroad, through whose instructions our own people will soon be able to utilize the thousands of mulberry trees, now coming to maturity in various portions of the State.

We have already in the market, sugar, the product of our own soil and manufacture, which will compare favorably with any imported article; and it is safe to say, that this enterprise, so suddenly and so practically initiated, will very soon take a stand as one of the leading and most important industries of the State.

We may truly say that the year 1871 dawns upon us under circumstances most encouraging for our future prosperity.

Lawn Mower.

There comes to us the description of a very neat lawn mower, which seems to embody the good points of many other machines, without their objectionable features. This is the so-called "Landscape" mower, an illustration of which is here given, and of certain points of which mention may be made.

For throwing the machine in or out of gear, in place of a ratchet and spring, a patent friction pawl is used, so that the mower is always in gear when going forward, and always out of gear, and noiseless, when going backwards. This pawl is entirely concealed, and, like the gearing, is protected from obstruction by grass, dirt and other substances.

By means of an adjustable roller, in the rear of the knife bar, an easily-running machine is produced, which, we are told, accommodates itself to any unevenness of the ground, mowing borders or lawn alike, complete without trouble of change, and thus dispensing with shoes or rollers in front of the cutter, which beat down the grass and make it impossible to cut evenly.

The cutting surfaces are made of the best cast steel, hardened and tempered, and attached to a heavy fly in a very substantial manner. The whole machine is built with great care, and weighs 65 pounds. It cuts a 15-inch swath and can be operated by anybody. The price is \$25. The manufacturers claim long experience with lawn mowers of every description, and that they can recommend this with perfect confidence in its merits. They seem to have a very good article. For particulars, apply to Hovey & Co., No. 57 State street, Chicago, Ill.

HORSE HARNESSING MACHINE.—A correspondent of the *Rural New Yorker* says that a gentleman of that city has arranged a device whereby a horse may be unharnessed and the harness be hung up in thirty-two seconds!

The device consists of two small iron pulleys, a small cord three yards in length and a hook. One pulley is fastened to a joist directly over the horse's back, the other a yard to the left. The hook is to draw the harness up with, the cord being through the two pulleys, with an iron ring through the left hand end of the cord to fasten upon a large nail to hold the harness up. The harness must be made with the collar open at the bottom, with the hames attached to the collar, so that the harness will raise up from the horse. The lines are left over the dash, nor are they unbuckled from the head-stall; the tugs are left hitched to the buggy, so are the hold-backs, and the shafts are left in the loops; the head-stall is taken off with the lines attached, and hung upon the back-saddle; the hame-strap is unbuckled, the two girths unbuckled, and all the harness, with the shafts, are drawn up together. Of course the harness must be suspended directly over where the horse stands as he is driven into the carriage house. In harnessing, the animal is placed in the shafts, the harness lowered upon his back, the straps which have been loosened must be again made fast, the hook disconnected and the work is done. The device is applicable to double as well as single harness.

DUMMY ENGINES FOR SAN JOSE.—We believe it is generally known that the Santa Clara and San Jose Railroad Co. have ordered from the East one or more dummy engines. A recent number of the *Detroit Inventor* says of this engine:—"We examined the dummy engine invented and constructed for the San Jose and Santa Clara Railroad, and find them to be perfect models of compactness, power and simplicity. They are said, by the makers, to be almost noiseless in their operation, thus overcoming the prejudice which has long existed against the use of engines on street railroads."

AGRICULTURAL REPORTS.—We are under obligation to Hon. A. A. Sargent, our able and industrious Congressman, for late copies of the U. S. Agricultural Reports.

POPULAR LECTURES.

Vaporization and Elastic Force of Steam.

[Prof. JOHN LECONTE before the MECHANIC ARTS COLLEGE, Mechanics' Institute Hall, S. F. Reported expressly for the PRESS.]

Steam Under Pressure.

LECT. IV. Feb. 4. I have before treated, said the lecturer, of the laws of the elastic force of vapor below the boiling point, and of boiling under the ordinary pressure of the atmosphere. I have now to speak of the laws under pressure greater than that of the atmosphere. When a liquid is converted into vapor, its volume is very greatly increased. For instance, one cubic foot of water has a volume of 1,698 cubic feet when converted into steam. This occurs under the ordinary pressure of the atmosphere; and, with this condition, steam (not in contact with water), or any vapor, if subjected to further increase of heat, takes a corresponding increase of volume.

If, however, we heat the vapor in the presence of the liquid, which we can do by heating it in a closed vessel, the elastic force increases more rapidly than does the temperature. This has two causes:—the vapor grows hot and strives to increase in volume, and fresh vapor is continually formed. Now this matter is very closely associated with the practical use of steam, and therefore is very important from a practical

point of view. So important is it that governments have engaged scientific men to investigate the matter, and have provided means for more extended research than would be possible for private parties, in order to ascertain the relations of increase of temperature and elastic force (or pressure) of vapors.

The first extensive and accurate experiments were commenced by Arago and Dulong, in 1829, at the instance of the French Academy. These were for the purpose of finding the elastic force of steam up to the highest pressure which can occur in practical life. They used an apparatus somewhat like this which we have here [and which is shown, in vertical section, in the accompanying cut].

Experiments.
We have here a closed vessel, A, of metal, in the lower part of which is placed mercury, B, and above this is water, C. On heating this by a lamp or fire below, at H, steam is formed, at D, which presses on the water and, through this, on the mercury. If we insert the bulb of a thermometer, F, into the steam, we can determine the temperature at all times, and if we insert into the vessel a glass tube, E, whose lower, open end extends into the mercury, we can also determine the pressure of the steam by the height to which the mercury will be forced to rise in this tube. G is a stop-cock or safety-valve, for allowing the escape of steam when the pressure gets too great for safety.

The inherent trouble in this experiment is, that the temperature and pressure both alter each minute, and consequently it is difficult to make exact observations. On this account, and to remedy one or two other errors, Regnault commenced, in 1841, a series of experiments which are still continued, unless the present war has put a stop to them. His work was done with the very greatest skill and accuracy. Arago and Dulong carried their researches up to a pressure of 24, and Regnault up to a pressure of 27 atmospheres, beyond which we cannot go in practice without great danger.

These experiments give the relation of pressure and temperature. [The lecturer showed tables found by experiment.] Above these pressures, we can only reckon by formulae deduced from the results obtained below them; but no formulae (although we have over 50) can be said to be exact.

The tables show why it is so dangerous to use steam at very high pressures. The danger arises not so much from the mere extent of the pressure, for we can make our vessels very strong, as from the fact that a slight variation of the temperature (which always varies in practice) at these high points causes a very great variation in the pressure.

As a vapor must have the same elastic force in all spaces which connect with one another, and as this force cannot be so great in the colder

er places as in the warmer, if we connect a number of vessels, filled with vapor, but some colder than the others, we find that the vapor in all takes the elastic force of the colder vessels. Watt's condenser is constructed on this principle.

The Most Economical Boiling Point.

We have seen that by increasing or decreasing the pressure on a liquid we can make it boil at almost any desired point. The question is then natural: Is it more economical to generate steam in practice at a high or at a low temperature? Watt was perhaps the first to investigate this subject, and he concluded that it made no difference. He found by experiment, if the boiling point is 100°, to heat one cubic foot of water from 32° to this point takes (100—32=) 68° of (sensible) heat, and to evaporate it takes 1062° of (latent) heat; total required to heat and evaporate, 68+1062=1130°. To heat from 32° to 212° and evaporate, takes 180° sensible heat and 950° latent heat; total, 180+950=1130°. To heat from 32° to 250° and evaporate takes 218° sensible heat, 912° latent heat; total, 218+912=1130°. The sensible heat is the heat required to raise the water to the point desired, the latent heat is the heat required to change a certain amount of fluid into vapor. We have seen that, no matter how much heat you apply to water (in the air), you cannot get the thermometer to rise above the boiling point. This excess of heat is not lost, but is absorbed by the water in changing into steam, and is called latent, because it disappears for the sense of feeling or the thermometer. [That heat is absorbed when a fluid evaporates can easily be made perceptible to the senses. If a person pours a little alcohol or other volatile liquid on the hand, he finds that the hand feels cold, for from it has been taken the warmth necessary to vaporize the liquid.]

Southern, a Scotchman, experimented and concluded that the latent heat was the same for all temperatures. Regnault's most careful observations show that both Watt and Southern were wrong, but that Watt was nearer the truth than Southern—was not very far out of the way in fact.

Persons acting on the idea that they could economize fuel by lowering the boiling point, introduced vacuum pans into sugar manufacture. They, of course, effected no economy of fuel; but, it may be remarked, they found an unexpected gain,—an increased production of sugar, because a smaller amount is changed into molasses.

Uses of Steam—A "Horse Power."

The uses of steam are two-fold: as a heating agent and as a mechanical agent. As a heating agent it is very valuable, because it can be so easily forced to any desired point, and because it has so large an amount of latent heat which it can be easily made to give up (by condensation) wherever it is required. As a mechanical agent its value is well known to all; it can be made to exert its tremendous elastic force one moment and then to stop, and thus can easily be utilized to perform work.

We often hear it stated by practical engine constructors that the evaporation of one cubic foot of water per hour is equal to one horse power; that, for instance, a 100-horse power engine should be constructed so as to evaporate 100 cubic feet of water per hour. We can calculate this as follows:

Suppose we had a very long tube, placed vertically and one foot square. At the bottom we put a cubic foot of water. There is a pressure on this water,—the pressure of the atmosphere, which is equal to 14.69 lbs. per square inch. Therefore the pressure on the surface of the water (1 square foot) is equal to 14.69 × 144 or 2,116 lbs.

Now if we change this water into steam, it will take up a space, as before said, of 1,698 cubic feet. But to do this it will have to raise this column of air, which weighs 2,116 lbs., up 1,698 feet. This requires a pressure of 2,116 × 1,698 or 3,589,200 foot pounds. We call a horse power equal to 1,980,000 foot pounds. Therefore the force of our steam equals 3,589,200 ÷ 1,980,000 or 1.81 horse power. But in practice we get only about six-tenths of the theoretical amount of work, and 1.81 × 0.6 = 1.08 horse power, which is quite near the amount stated.

The Most Economical Liquid—Distillation—Heat.

If we experiment with liquids, we find that many of them require less heat to evaporate a given amount than is the case with water. Would it, then, be not more economical to use them than it would to employ steam? Now the economy varies not only (inversely) as the total (sensible and latent) heat, but also directly as the volume of vapor generated. With many of these the volume is less, and when we consider that water is exceedingly cheap, we find that probably no other liquid will be substituted for it in practice, especially as many other substances exert a chemical action on the vessels which are used.

The process of distillation consists merely of successive vaporizations and subsequent condensations of a liquid. The object of distillation are: 1. To separate liquids from the solid mechanically mixed with them, as to purify water from dirt. 2. To separate liquids from (non-volatile) salts. 3. To separate liquids of unequal degrees of volatility, as alcohol and water. In this last case, several distillations are necessary, some water but more alcohol going over each time. We can thus get our alcohol nearly pure, with only 5 per cent. of water, but to get it absolutely pure is impossible by distillation. For this we must resort to chemistry.

Two hypotheses have been brought forward to explain the phenomena of heat. The older

one was that heat was a substance in bodies, a fluid surrounding the molecules. But to account for the heat generated by friction puzzled the upholders of the theory. Count Rumford made water boil by boring out a cannon immersed in the liquid, and Sir Humphrey Davy melted two pieces of ice, by rubbing them together, in a vacuum at a temperature below the freezing point. The latter theory, which is far more satisfactory, regards heat as the motion of the particles or atoms of bodies. When, according to this theory, we rub two bodies together, the motion of the mass is retarded, but motion is imparted to the molecules, and thus heat is generated. This hypothesis seems to explain all other phenomena of heat.

The "Novelty" Lantern.

The accompanying illustration shows sufficiently well the construction of a claimant for popular favor. It is so simple that a detailed description is not necessary. But the shape of the chimney may be remarked on. Instead of a round or pear-shaped globe, an ordinary straight lamp-chimney is used, which can be procured at

any country store for about fifteen cents. This is one of the great advantages of this contrivance which will be easily appreciated; for while the breakage of the glass renders the common lantern useless, this is not the case with the "novelty." The chimney is secured against all ordinary accidents, and can easily be replaced should it happen to get broken.

The lantern is said to give an excellent light, not to smoke the chimney, and to be particularly good in respect to not getting out of order. It answers the purpose of a house lamp or an out-door lantern, not being affected by wind or motion. A patent has been granted for it to Mr. A. Withmar, of St. Louis. Any enquiries with regard to it may be addressed to A. Withmar or to the Withmar Glass and Queensware Co., 113 North Main street, St. Louis, Mo.

STARTING NEWSPAPERS.—One peculiarity of our American people, and an encouraging one, is the eagerness which they show for starting a newspaper at a new place. The rapid growth of new settlements once astonished the outside world, but people have become accustomed to it now. But this feature of commencing a paper as soon as a town is founded, is now getting to be a common one, and to it we are indebted for the diffusion of a wide-spread intelligence among the inhabitants of our country. The excellent character and ability of many of the journals is really surprising; a "country paper" is by no means necessarily a dull, stupid sheet, but in our interior exchanges we often find matter which excels much in our "enterprising" city journals. We see it stated, by the way, that Kalama, a town just founded on the Columbia River by the Northern Pacific Railroad, is to have its paper. This is coming pretty near to reading before one is fairly born. The phenomenon can hardly be witnessed outside of the United States.

COAL MINE MONOPOLY.—The *Bulletin* states that it has ample evidence of the operations of certain capitalists here to secure a monopoly of the coal mines of the Pacific Coast. The Mount Diablo, the Bellingham Bay and all but the chief coal mine at Coos Bay are now within the control of these parties. The paper gives items with regard to their failure to secure the last-named mine.

Mount Rainier Firing Up.

Many of our readers will remember that, in the graphic account published by us of the ascent of Mount Rainier, by Messrs. Stevens and Van Trump, in August last, it was stated that they slept near the summit on a sheltered spot which was warmed by the fires of a nearly extinct crater, and they saw steam issuing from the crevices in the rocks. However incredulous others may have been of the existence of smoldering fires in the mountain, these gentlemen saw enough to remove any doubt from their minds.

Since winter set in, with its rains on the plains and its snows on the mountains, people living within daily view of Mount Rainier have observed strange and unusual sights on its rugged sides. One day it is seen covered, apparently at great depth, with snow from the summit to the base; the next day not a vestige of snow is visible. And so it is alternately white and gray from day to day; while some persons allege that they can plainly see smoke and steam ascend from the mountain. None who have witnessed these sights doubt the existence of fires in the mountain, to the heat of which they attribute the rapid disappearance of the snows. In support of this belief it is further stated that the rivers and streams in the vicinity, the Puyallup among others, have for some weeks been much higher than usual.

From all the signs it would appear that old Rainier is firing up for a grand pyrotechnic display. In former years, at this season, the mountain was clad in snow from the foothills to the summit, without a rent appearing in the raiment for months together. Only in summer, under the rays of a warm sun, was the snow partially melted, exposing small portions of its naked sides to the beholder. Should the fires continue to increase in intensity, it cannot be long before they will break through the crust which now confines them, and issue forth in flames and ashes and molten lava. What a grand spectacle that will be! If this exhibition comes off according to promise, we shall have another attraction to add to the many which now inspire with awe and wonder the tourist who comes to see sights in Washington Territory.—*Olympia Tribune*.

July 4, 1876.

Hon. John Bigelow has written a letter with regard to taking steps for an appropriate celebration of the 100th anniversary of the Declaration of Independence. He proposes that preparations should be commenced at once, that we may be able to give an adequate expression of our patriotism. The celebration should be national and universal, and the participation of foreign countries might be invited to some extent. As a commencement he makes several suggestions: The completion of the Washington Monument, of the Capitol buildings, and, as far as possible, of projected railway, telegraphic and other public works throughout the country; the restoration of the gold standard of values; redemption of the national indebtedness; making geological surveys in states which yet lack them; taking an extra Federal census in 1875. These may or may not be associated with the celebration.

He also proposes for consideration several ways of celebrating the day: coining a complete set of gold or silver current coins with appropriate devices; a poem from an eminent poet; memorials from every art, showing the degree of excellence attained therein; inviting foreign nations to participate; an American Congress for settling many grave international questions; preparation of a series of histories by which to measure the product and progress of civilization in the U. S. for the expiring century; founding a national museum.

The suggestions are worthy of consideration. Some may appear at first a little visionary, but then there is no limit to possibilities, apparently, in our country. The idea is certainly excellent of commencing immediately to prepare for a proper celebration of the most memorable anniversary in our history.

CENTRAL CITY, Colorado, is taking measures for a water-supply. It is estimated that an adequate supply can be obtained at an expense of about \$3,000.

ENCOURAGING.—The publishers of the SCIENTIFIC PRESS have been receiving most ample encouragement this year. Subscriptions have been more generally renewed than ever before, while new names have been added to our lists from various parts of the west and the east, and also from foreign countries. The conductors of journals, both on the Atlantic and the Pacific slopes, have given us the kindest and most flattering of notices, and from all sides we receive the most satisfactory proofs that the circulation and influence of our paper are ever extending. This is owing, we may be allowed to believe, to our efforts to make the Press a reliable paper, keeping pace with the progress of the times, containing the cream of what belongs in its scope, and ever striving for the best interests of its readers. Making a really good paper, we are more and more fully convinced, is the most profitable journalistic method. But our increasing success is also due partly, without doubt, to the increasing faith and interest in practical and legitimate mining, and to the general advancement of our mechanical industry. We therefore congratulate our readers in congratulating ourselves.

ACADEMY OF SCIENCES.—At the meeting on Monday, referred to elsewhere, a number of donations were made. Dr. Gibbons presented a fine specimen of petrified wood found on one of the Aleutian Islands. A large under-jaw of a sperm-whale was donated by J. C. Merrill & Co. Mr. Wackenreder gave a live specimen of *Filaria*, 2 feet long, found in a pipe connected with a well in solid rock, on the San Bruno road. E. Durand presented a specimen of cinnabar. The crystals presented a combination of the prism and rhombohedron not mentioned in Dana or Dufrenoy. On the piece were said to be specimens of metacinnabarite imperfectly crystallized. If this is the case, it disproves the assertion of Dr. Moore (who examined and named the mineral) that it is always amorphous.

Since the above was written, Mr. Durand has shown us specimens of cinnabar, the crystals being long prisms terminated by low rhombohedrons. With them (underneath) occur indistinctly crystallized masses of what is said to be black cinnabar or metacinnabarite. The occurrence is very interesting.

Academy of Sciences.

This institution has been in existence since the year 1853. It was founded by a few gentlemen who were interested in the cause of science, and it has continued to exist, although up to about 1865 the number of members was limited, and to labor quietly and patiently in the collection and comparison of facts in the natural history of the coast. Of late years, more interest has been taken in its proceedings, the collections have been increased, numbers of eminent men have contributed to its proceedings, more members have been added; and now it seeks to get the means for erecting a building of its own, in order to have the necessary room for its large cabinet of national production.

The plans for such a building are modest and do not involve the necessity of a large outlay. Nevertheless, it is necessary for the Academy to appeal to the public for assistance. It proposes to erect a building so located that it could derive some revenue from rent of stores, with ample room for the society in the upper stories, with a lecture room, library and reading room. Such a building would draw additional members, and would be an addition to our city.

The appeal to the public is proper, for the existence of such an institution is an advantage to the community. It adds to our general reputation, and certainly it is important to a people that they should stand well in the estimation of others. It adds to the welfare of the people in a "practical" manner; no one can deny that the Smithsonian Institute, our National Academy, is a direct benefit to the United States. Had we no scientific institutions and academies we should be far back in the dark ages.

To conform with the legal requirements, the academy will incorporate; and for this purpose trustees were elected last Monday. The gentlemen elected were F. L. A. Pioche, Samuel Hubbard, Dr. C. M. Hitchcock, Elisha Brooks, Gen. J. Hewston, Dr. J. Blake and H. P. Carleton. In a short time a plan will be presented by these gentlemen to the public, with an appeal for financial aid. We hope that their request may be promptly answered.

SMELTING WORKS AT EUREKA, NEVADA.—The *Sentinel* gives a description of the works of Ogden, Dunne & Co. The smelting furnace has a capacity of 13 to 14 tons daily. The capacity of the refinery is six tons daily, and the usual run is 30 to 40 tons weekly. The litharge produced (from 40 to 50 per cent.) contains about \$1.50 per ton in silver and is mostly shipped East. The mechanical arrangements are described as excellent. The whole cost of the works exceeds \$40,000, all of which has been paid. Another furnace (we hear elsewhere that it is to be substantially the same as that illustrated in the Press of January 14th) is soon to be built. C. Liebenau is the metallurgist of the works.

LAND PATENT DECISION.—In the case of an application for a patent for 160 acres of surveyed placer land in Montana, the Land Commissioner has decided that 10-acre lots on surveyed land in mining districts are legal subdivisions, and that such legal subdivisions may be either 10+10 or 5+20 chains, as desired, only the sides cannot run at an angle with the lines of the regular surveys. The commissioner remarks that "to require mining claimants in cases like the present to postpone making applications for patents until adjoining miners are willing to unite in making a joint entry of their respective claims, or to include in their application large areas of worthless land to be paid for at double the minimum price of good agricultural lands would not only be a hardship upon the miners, but inconsistent with the spirit and intention of the statute."

Wonderful Discoveries.

Every now and then, some enterprising, but uninformed individual, sees a mineral substance which he does not know, and immediately proceeds to guess what it is, and to publish his guess as a fact. In this way, we often hear of the existence of huge deposits of valuable minerals, which are reported in the papers West and East, but which prove, on examination, to be entirely different from what they were first guessed to be.

Borax is all the rage just now. We have seen the existence of acres of borax, many feet deep, asserted in the journals, but on how good authority we do not know. Consequently, we are unable to deny the assertions; but still we doubt. From the Owen's River locality, mentioned in another column, a lot of borax has been sent to this city. Mr. Henry G. Hanks has examined quite a large amount, which unfortunately contains not a trace of boracic acid, but is simply hydrous sulphate of soda. Now we cannot know but that the other fields of borax may prove equally deficient in this most essential component.

Tons of sulphate of soda have been sent to San Francisco, under the impression that they contained something more valuable; which they occasionally do in small amounts. We often discover, in this way, interesting specimens, but the senders probably feel hardly satisfied by the result. A little more mineralogical knowledge would save them much expense.

Borax is found in a number of places on our coast, but nowhere do we know of deposits so extensive as those at Borax Lake. Boracic acid exists in other minerals and in varying quantities. Armed with a lamp or candle, a blow-pipe and a piece of platinum wire, the prospector can easily make a preliminary examination of his suspected borax. The mineral, if really borax, will first puff up and then easily fuse to a transparent bead before the blow-pipe. This simple and easy examination will suffice to discriminate borax from many other minerals. Mr. Hanks recommends as the best test for boracic acid in minerals or compounds containing it, to powder the substance, put in a small evaporating dish, add sufficient sulphuric acid to make a pasty mass, then add alcohol, and heat with a spirit lamp. When heated nearly to boiling, remove the lamp and ignite the alcohol. The flame will be principally yellow (the sodium flame) but by blowing on it so as to agitate it violently (without extinguishing), a green flame will show the presence of the boracic acid.

AN APPEAL TO HUMANITY.—The S. F. Chamber of Commerce appeals to our California public to contribute towards the alleviation of the terrible sufferings of the French people. All political questions are laid aside, all opinions as to which nation is right in the present contest. The people are starving, dying,—that is the only point considered. Other states are contributing. Shall California refuse? Donations may be sent to C. Adolphe Low, 208 California street; J. C. Merrill, 204 California street; C. S. Hopkins, 318 California street; Jacob Deeth, 203 Sacramento street; or Albert Dibble, 38 California street, San Francisco.

COTTON LANDS WANTED.—A gentleman from the Mississippi is in correspondence with Maj. Means, of Stockton, with regard to securing a large tract of land in this state, with the view of transplanting thither a colony of cotton planters; 30,000 or 40,000 acres are wanted.

LARGE YIELD OF CORN.—A farmer on the Bolsas Rancho, in the Stearns Grant, near Los Angeles, is said to have raised the past season 700 bushels of corn on five acres of land, or at the rate of 140 bushels to the acre!

A Co-operative Gold Mine.

The Press has previously advocated co-operation among miners. In Victoria, Australia, as we learn from R. Brough Smyth's valuable book, a number of co-operative companies exist. A detailed account of the management and operation of one of these companies was given some time ago in the London *Gentleman's Magazine*, which we copy (in a condensed form) as worth reading by many of our subscribers.

On the Great Redan Reef of the gold fields of Ballarat, a company was established called "The Great Extended." It was first formed on the 10th of March, 1857, by eighty men on the co-operative principle, all being working shareholders and all sharing equally. Three officers were selected, namely, an underground manager, a secretary, and a treasurer. The miners were divided into three gangs, each to work eight hours, and with this arrangement they work day and night all the year round. They commenced sinking a shaft seven feet six inches long, by only three feet, three inches wide, being exactly the dimensions of an ordinary grave, the difference only being in the extraordinary depth. They were well aware at the outset that they might have to sink the shaft between three and four hundred feet, and that in doing this they would have to pass through several layers of rock. The reef on which they were sinking rises and falls like hills and valleys, and the gold, they knew, would have been lodged by its own weight in the very center of each of these valleys; which center, or lowest dip of the reef, is termed, with modest impropriety the "gutter." In bygone ages this gutter was a creek or water-channel, and it winds along underground just as a creek does on the surface. Now, although the miners knew that this gutter containing the "lead" or track of the gold ran along in various places below, they could not know where it was, nor at what depth; their minds were therefore made up to sink to the bottom of the reef and then commence "driving" (that is, tunneling) in various directions till they found it. But whether it was by singular good fortune, or that these eighty practical miners laid all their hard heads together, sitting in council before they began to dig their profound grave, yet it so occurred that they descended right upon the golden gutter. Thus they obtained a rich mass of gold immediately, and without driving an inch to find it.—[Smyth states that they bottomed within 15 feet of it.—ED. PRESS.]

The shaft of the Great Extended cost nearly \$700 per foot. The depth was between three and four hundred feet, in the course of which they had to pass through four layers of hard basaltic rock, rendering blasting necessary the whole time. These four layers amounted together to no less than two hundred and thirty feet of solid rock. The shaft was slabbled, that is, lined with massive timber planks, as they descended, and is thus lined from top to bottom. The sinking of the shaft, including the slabbing, occupied these eighty working shareholders, day and night, three years and four months, during which they never touched a penny. They had, moreover, to find themselves in food and clothing. An example of mutual good faith and honest co-operation, as of Anglo-Saxon perseverance, which seems to me well worth recording.

The cost of the undertaking may be thus roughly set down. Each shareholder contributed \$392.50, amounting to \$31,400. The Union Bank of Ballarat advanced them \$10,000. Eighty men's labor for 169 weeks, valued at \$15 per week per man, making \$202,800. The shaft, when completed, thus cost \$244,200 before a shilling of return was realized. Besides this, we are to bear in mind that they might have to commence driving in various directions had they not been so fortunate as to have alighted on the gutter.

The reward of all this persevering labor and expense soon came. In the first twenty-one days after arriving at the gutter the "wash-dirt" yielded eight hundred and eighty ounces of gold—value, \$17,100. On the 23d of June, 1860, the first dividend of \$220 per share was paid. Up to March, 1861, the mine had yielded over \$180,000, and there is every sign of the yield continuing the same for years.

HAVANA CIGARS.—We see it stated that there are eleven thousand factories in the United States, which make "pure Havana" cigars.

Sunset on the Coast.

We reproduce this week a fine marine piece by one of our most celebrated American marine painters, Mr. De Haas, of New York. The original painting has been chromo-lithographed by L. Prang, and the engraving is copied from the chromo.

We proposed, in a former article, to say a few words concerning chromos. As we owe the extensive application of this art to Mr. Prang, it may be of interest here to give a few facts in the history of this gentleman. These may be considered correct, as they are taken from his own paper.

Mr. Prang is by birth a German, and received in his native country and other continental States, as well as in England, a thoroughly practical education in everything pertaining to the application of chemistry to the useful arts. Becoming embroiled with the Government of Prussia in consequence of the active part which he felt it his duty to take in the revolutionary movements of 1848, he determined to emigrate to the United States, and, soon after his arrival here, took up his residence in Boston, where he has continued to live ever since. He has employed himself chiefly in wood engraving and lithography. At the beginning of the war, his local business as a commercial lithographer being entirely ruined, he commenced the publication of military maps, card portraits of the Federal Generals, album pictures and illuminated texts; and his immediate success in these ventures led him to attempt chromo, the monopoly of which hitherto had been enjoyed by Enrope. His first chromos were not successful, but the publication of a group of chickens, after Tait, won an instant popularity, not only for the picture itself, but for the new art. Since that date he has issued, in regular and quick succession, a series of chromos after American and foreign artists, but chiefly after native painters, which have been received with almost unvarying favor, and have won for his house a popularity that is seldom attained excepting after long years of honest work, great expense and untiring energy.

His art publishing house, the first building ever erected in the world for the sole purpose of issuing art publications for the million, was first occupied in October, 1858, and in it, at present, one hundred men and women are constantly employed. It is situated in what was once Roxbury, a city which has been annexed to Boston and now is called Boston Highlands.

Mr. Prang has been so successful, that he has found it necessary to establish agencies in every large city in the Union. The agents here are Messrs. Snow & Roos, who have a choice collection of chromos as well as of engravings and paintings. They are to be found at No. 21 Kearny street.

MR. JULIUS A. PALMER says that the number of Chinese in this country does not exceed 100,000.

Work at the City Foundries.

This is usually the dull season of the year for the foundries, yet we find that most of the works are kept very busy, this year, some having fully as much to do as they are capable of doing.

THE FULTON FOUNDRY is engaged making shafting (about 300 feet), pulleys etc., for the Oakland Cotton Mills. A saw-mill is being built for erection on Russian River. Work is still being done for Severance and Holt's Diamond Drilling Machines. For the Imperishable Block Pavement Company, a 10x20 inch engine, with boilers, etc., complete, is being constructed. The works are making machinery for the California Sugar Refinery, among which are two large 7-foot pans,—"Blow Ups". For S. M. and A. Duncan, of Russian River, a small, 10-ton locomotive is being built, together with cars, for the transportation of lumber. Cars are also being built for the Coos Bay Coal Company, and there is a large amount of miscellaneous work in hand.

THE ETNA WORKS are making propellers for the steamers *Kitty* and *Water Witch*, and are repairing the machinery of the *Senator*.

the Vulcan Works are making for this firm thirty-two double glue-pots of the largest size.

THE PACIFIC IRON WORKS are engaged on the castings for smelting and calcining furnaces for Ogden, Dunn & Co., at Eureka, Nevada; also on a considerable amount of machinery for the Nevada Land and Mining Company, at Reno. For the Pocahontas mine, El Dorado County, pumping and hoisting machinery are being built. They are putting in a new shaft for, and overhauling generally, the steamer *Nevada*, which is to be put on the new Australian line. They have a contract for putting up the city gas works at Woodland, Yolo County, for the Pneumatic Gas Company, and have other jobs which keep them very busy.

THE MINERS' FOUNDRY is at work on two pony-gang saws for a saw mill on Puget Sound. Each contains 32 saws, which are run by 12x18 inch direct-acting steam engines, placed under the saws. The massive frames are of iron, and the mill men assert that these saws effect a saving of twenty per cent in the lumber over the common circular saws. For another mill on the Sound they are constructing a heavy steam engine,

Electrical Machines.

Pursuant to an invitation from the superintendent of the Electrical Construction and Maintenance Company, a number of persons met at the office of the Western Union Telegraph Company to witness the working of instruments for transmitting messages and exploding blasts. These have just been introduced on the coast.

Electric Exploder for Mines.

One of these instruments was a frictional electric machine for exploding blasts. The machinery is enclosed in a circular case of vulcanized rubber, 12 inches in diameter and 3 inches through, with plates of iron on each side, to strengthen and protect the works, the whole fitting in a wooden box, and weighing 15 to 20 pounds. The rubber case renders it independent of the atmosphere so that it can be used in rainy weather or damp localities, where frictional machines are apt to be useless. The apparatus is so constructed, we are told, as to give an intense charge of electricity and to be free from the trouble of leakage or liability to get out of order. In the experiments, 40 cartridges were exploded at one time, showing the power of the machine. Another important point is the price, which is \$150. The intensity of

the electrical stream generated, its apparent protection from the atmospheric influences, its durability, lightness, ease of being transported and ease of handling, would recommend the apparatus to miners. Mr. Fields, one of the very first electricians on the coast and a gentleman who has had more experience than any other person here, in blasting by electricity, speaks highly of it, and his opinion is worth much. If our readers will read the article on "Gunpowder and Dynamite Blasting" in the SCIENTIFIC PRESS of Oct. 22d, 1870, they will find some valuable remarks on blasting by electricity and on the gain over the common methods where an ordinary gunpow-

der fuse is used. Experiments near Vienna, Austria, give this gain as about 50 per cent.

Printing Telegraph Machine.

The other instrument was Phelps Electric Printing Telegraph machine, which has many valuable points. It is intended for private use and seems to be an improvement over other machines of the kind with which we are acquainted. A description would require too much space to be given here. It not only prints the message at the receiving, but also at the sending station, so that the sender sees just what he is telegraphing and knows whether or not he has made any mistake. It does not require the presence of an operator to receive, but the message is printed and remains until the receiver may choose to read it. It is said to be exceedingly durable, easy to manage, requiring no special knowledge and but a comparatively small amount of experience to operate. It was patented by Mr. Phelps of the W. U. Tel. Co., of New York, and is used in that city by the Stock Board for transmitting messages to different brokers' offices, and by a number of firms in connection with their manufacturing establishments at a distance from their offices. The cost of two machines, one at each end of the line, is about \$600 where both receive and send; or about \$450 where both take but only one sends. These are not the exact, but only approximate, figures.

SUNSET ON THE COAST. BY DE HAAS.

They are fitting up complete the road wagon and steam plows according to the designs of Mr. Oliver Hyde, of Oakland, of which we have previously made mention. They are making a lot of Varney pans and settlers for Mexico, machinery for a new brewery in this city and castings for the State Capitol, at Sacramento. They are busy on repairs for the Mission Woolen Mills and also on iron house-fronts, of which last they always have several orders on hand. They are building a Johnson Hoist and a jig saw for the Mission Woolen Mills etc., etc.

THE VULCAN WORKS are building a very strong, substantial, 16x36 inch engine for Selby's lead works, with two tubular boilers, 50 in. x 15 feet. The engine is very heavy, the fly wheel weighing six tons. They are at work on a 5-stamp quartz mill, with steam engine, boiler, hoisting works, etc., complete, for Mexico. They are making the machinery for the new "Linden" flouring mills, near Stockton; also two 6-foot retorts for the Pacific Wood Preserving Company. The extent of the furniture business of Mr. N. P. Cole & Co., may be judged of to some degree from the fact that

with 26-inch bore, which is perhaps the heaviest engine ever built on the coast. The State Capitol castings and other work keep them at their very busiest.

THE RISDON IRON WORKS are kept busy on various jobs. The hydraulic pipe manufactured by them, of which we have previously spoken, is in successful operation and they have orders for similar pipe for the Quail Hill Mining Company. They are engaged in what is a new feature in our California manufactures,—constructing iron decks for steamers. For the *Mohonga* they are making one of these, and, indeed, have the whole contract for the wood and iron work, which is of a nature calculated to make the vessel a first class steamer. Besides, they have on hand a variety of other work, keeping a large number of men busily employed.

EARTHQUAKE.—It appears that we had an earthquake here last Monday, at 7.17 A. M. Duration, 2 seconds; shocks, 2; direction, north-east and south-west. It was perceived by only a few persons. Shocks, at the same time, were reported at San Jose and Santa Cruz.

HOUSEHOLD READING.

How to Bone a Turkey.

• Clean the turkey; remove the intestines; cut off the first joints of the legs; cut down the backbone; very carefully raise the meat from the backbone on each side; unjoint the wings, leaving the small part of the wing bone; raise the meat carefully from the breast, using a sharp knife with a narrow blade. The meat being now detached from the bones, and those unjointed, draw out the frame; only the merrythought will remain, which can be easily cut out. Break up the bones; put them in a stew-pan; cover them with cold water, and stew while the turkey is being stuffed with a rich force-meat. First sew up the slit and any holes that may have been accidentally made, making the stitches on the inner side. The force-meat may be of well-seasoned sausage meat, or veal, minced fine, and seasoned with spices to taste, or with mace only, or use sweet herbs. After it is stuffed, so as to look as before the bones were removed, put it in a large stew-pan, that will just hold it without cramping; strain over the gravy from the bones. If this does not cover the fowl, add warm water; add any vegetable or sweet herbs liked, several slices of cold boiled bacon, and a few slices of veal. It will require from an hour to two hours gentle stewing. Let it cool in the liquor; take up the fowl; scrape off the gravy; melt and strain the gravy. Season it to taste, if not already sufficiently seasoned; boil it down to a jelly. Strain over the fowl, or serve around it, upon the dish.

VEGETABLES.—Vegetables intended for dinner should be gathered early in the morning. A few only can be kept twelve hours without detriment. "When freshly gathered they are plump and firm, and have a fragrant freshness no art can give them again when they have lost it by long keeping, though it will refresh them a little to put them into cold water before cooking." A little soda in the water they are cooked in will help to preserve the color of those that are green. They lose their good appearance and flavor if cooked too long, and are indigestible if not cooked enough; close attention and good judgment are necessary to know the proper time to take them up. Always drain the water from them well before sending to table; have the dishes hot upon which they are placed, and never send them to table until the meats are served; when sent too soon, and often uncovered, they become chilled and unfit for use. Always put vegetables to boil in hot water.

VALUABLE RECIPES.—The Boston Journal of Chemistry gives the following recipes for the benefit of those—and they are legion—who are troubled with harassing and annoying coughs that frequently accompany many acute diseases, and arising from nervous irritation of the larynx, pharynx, palate or other parts of the throat; Sulph. Morphia.....gr. j.
Dil. Sulph. Acid.....dr. j.
Simple Syrup.....oz. ij.
Mix. Half a teaspoonful to be given upon the tongue, and swallowed slowly. The persistent hackings of bronchial difficulties, and even of consumption, are often speedily relieved by it.

An excellent cough mixture, for constant use in the office or family is this:

Syrup Tolu.....oz. j.
Syrup Peru.....oz. j.
Syrup Sanguinaria.....oz. j.
Syrup Lobelia.....oz. j.
Tr. Wintergreen.....dr. j.

Dose,—half a teaspoonful three or four times daily, or whenever indicated. Cut these recipes out and preserve them. When needed present them to a druggist to be put up.

TO MAKE IODINE COLORLESS.—Tincture of iodine, so extensively used as a local application for swellings, etc., may be rendered colorless, without its strength being impaired, by adding to it a little hyposulphite of soda. This is a most desirable discovery since it is often necessary, apply it to the face, neck and hands, where the ordinary brown preparation would make the patient present an uninvitable appearance.

HINTS TO HOUSEKEEPERS.—Rise early in the morning, or you will not get a fair start with your business. Rise earlier on Sunday morning than on any other day, that the children may be at Sunday-school in time; and domestics have time to arrange their necessary business as to be able to attend divine service.

The Skin and its Functions.

In concluding the article commenced last week, on the the functions of the skin, and referring to the illustration here again given, 6 and 7 are the perspiratory glands and ducts, which are so exceedingly small that, according to calculations of Wilson, the standard authority on the anatomy of the skin, there are twenty-eight hundred to every square inch of the body. The number of square inches in a man of ordinary stature is about twenty-five hundred, so that the number of glands and tubes would be about seven millions, and the length of tubing through the skin about twenty-eight miles. By this delicate and complicated apparatus are performed some of the most important functions of the system. The amount of liquid carried off through this apparatus, in insensible perspiration, and the effects of it in removing the impuri-

1. Cuticle, or Scarf-skin.
2. Rete Mucosum, or Mucous Web.
3. Corpus Papillae.
4. True Skin.
5. Cellular Membrane, or Fat Cells.
- 6 and 7. Perspiration, Glands and Ducts.
8. Roots of Hairs.
9. Oil Follicles.

ties from the blood and in regulating the temperature, is very important. It is estimated to be, on an average, eleven grains every minute. The amount of course varies very greatly according to the dryness of the atmosphere, the degree of activity of the circulation, the temperature to which the body is exposed, the amount of liquids previously taken, &c.

Besides this function of eliminating perspiration, and with it the impurities of the blood, the skin secretes an oil, which lubricates the hair, &c., as seen in the little glands at 9, and also secretes in different parts of the body odor peculiar to each individual.

The distinctive odor is not in many instances sufficiently strong to be recognized by human olfactories; but the dog, whose olfactories are much more acute, can recognize his master and follow him through a crowded city, by the effluvia which is transmitted through the leather of his boot to the sidewalk,—a fact that would seem incredible, but is nevertheless well known.

By the aid of the cut and description, we shall be able to understand the importance of friction and ablation. The scarf-skin is made up of laminae, which are constantly falling off to make room for new laminae underneath. They are placed obliquely on each other, like shingles on a roof, and serve as valves to prevent the access of air to the sensitive papillae and skin underneath, and when contracted by cold, or when the interstices are filled with concreted and dried effete matters from within; or dust and dirt from without, the mouths of the delicate ducts through which the perspiration is evolved are filled, and thus the important process of perspiration described is obstructed.

To keep the skin in good condition, friction and bathing are indispensable. A crash towel and flesh brush will serve as instruments for friction. Let any one who has never enjoyed the luxurious sensation of a thorough friction of every part of the skin, try it some night, when he comes home tired and dusty, and the pleasurable glow of health and the refreshing sleep that will follow, will make him wonder that he has so long neglected a duty, and one that so manifestly adds to his comfort. Everybody carries his horse, and knows that neither oats, nor corn, nor hay, nor all together will keep him in good condition without that operation. Can he give a good reason why he should not curry himself?

Domestic Receipts.

VOLTAIRE'S RECIPE FOR DYSPESIA.—Take no other nourishment than the yolk of eggs, beat up with the flour of potatoes and water.

SIR JOHN SINCLAIR'S RECIPE FOR DYSPESIA.—Beat an egg in a bowl, then add six table spoonfuls of cold water mixing the whole well together; then add two table spoonfuls of the farina of potatoes, to be mixed thoroughly with the liquor in the bowl; then pour in as much boiling water as will convert the whole into a jelly, and mix well. It may be taken either alone or with the addition of a little milk and moist good, pulverized sugar, not only for breakfast, but, in cases of great stomach debility or in consumptive disorders at the other meals. The dish is light, easily digested, extremely wholesome and nourishing. Bread or biscuit can be taken with it, as the stomach gets stronger. Potato starch and farina are one and the same.

CLEANSING VARNISHED PAINT.—In cleansing paint which has been varnished, there is nothing better than weak tea. All the tea leaves from several drawings should be saved and boiled over early in the morning of the paint-cleansing day. If boiled in an old tin pail or pan, the tea can easily be strained off for use. Wet a flannel in it and wipe off the oak-grained paint and you will be surprised at its brightness. No soap is needed, no milk; the tea is the most capital detergent ever invented. Wipe the paint dry with a soft cloth; you will find that very little elbow grease is needful. White varnished paint is cleansed as rapidly with it as the grained.

TO PREVENT BLISTERS.—Tannic acid can be obtained cheaply of any apothecary and is said to be an admirable remedy for perspiration of the feet and against blisters. It transforms the skin into leather and still permits perspiration to pass, but absorbs the ammonia and other bad odor of the feet. The skin being rendered tough by the tannin there is less danger of the formation of blisters.

RICE FLOUR CEMENT.—Mix the flour (as much as is needed) with cold water; pour into boiling water; let it simmer until a transparent paste is formed. When cold use it.

Mechanical Hints.

CEMENT FOR FASTENING INSTRUMENTS IN HANDLES.—A material for fastening knives or forks into their handles, when they have become loosened by use, is a much-needed article. The best cement for this purpose consists of one pound of colophony (purchasable at the druggists) and eight ounces of sulphur, which are to be melted together and either kept in bars or reduced to powder. One part of the powder is to be mixed with half a quart of iron filings, fine sand, or brick dust, and the cavity of the handle is then to be filled with this mixture. The stem of the knife or fork is then to be heated and inserted into the cavity; and when cold it will be found fixed in its place with great tenacity.

BLACK COATING FOR ZINC ORNAMENTS.—Dingler's Polytechnic Journal states that M. Neumann has instituted a series of experiments to point out the best materials to produce upon statuary or ornamental subjects made of zinc a pleasing, blackish coating, without impairing the effect of the natural color of the metal, as would be the case where an oil paint or varnish is used. The best results were obtained when nitrate of protoxide of manganese was employed. This salt, on being heated, is decomposed, yielding black peroxide of manganese, and the degree of heat required is not so high as to affect the surface of the zinc. The best solution for this purpose is fifty-four grammes of the salt in one litre of water.

TO TAKE BRUISES OUT OF FURNITURE.—Wet the part with warm water; double a piece of brown paper five or six times, soak it in the warm water and lay it on the place; apply on that a warm, but not hot flat iron till the moisture is evaporated. If the bruise be not gone, repeat the process. After two or three applications, the dent or bruise will be raised to the surface. If the bruise be small merely soak it with warm water, and hold a red-hot iron near the surface, keeping the surface continually wet—the bruise will soon disappear.

TO CLEAN AND RESTORE THE ELASTICITY OF CANE CHAIR BOTTOMS, COUCHES, ETC.—Turn up the chair bottom, and with hot water and a sponge wash the cane-work, so that it may be thoroughly soaked. Should it be dirty, use a little soap. Let it dry in the air, and it will be as tight and firm as when new, provided the cane be not broken.

Life Thoughts.

THE greatest truths are the simplest, and so are the greatest men.

THE body—that is dust; the soul, 'tis a bud of eternity.

HE who buys too many superfluities may be obliged to sell his necessities.

TOWERS are measured by their shadows, and great men by their calumniators.

WORK is the weapon of honor, and he who lacks the weapon will never triumph.

LET thy actions prove that thou art indeed a man in the highest and holiest sense of the exalted name.

SOUND ADVICE.—Never owe any man more than you are able to pay, and allow no man to owe you more than you are able to lose.

MANY person who appear to repent, are like sailors, who throw their goods overboard in a storm, and wish for them in a calm.

NECESSITY is the mother of invention and encouragement the nurse of it; what is brought forth by the one, should be propagated by the other.

TRUE piety is not a morose, but a cheerful thing; whilst it makes me joyful it delivers me from frivolity, yet it causes me to be pleasant and glad.

IF you wish to know a man's character, wait till some misfortune or disgrace happens to him; and you will soon see all his greatness or all his weakness.

A LADY once asked a minister whether a person might not be fond of dress and ornaments without being proud. The minister replied: "When you see the fox's tail peeping out of the hole, you may be sure the fox is within."

Whining.

There is a class of persons in this world, by no means small, whose prominent peculiarity is whining. They whine because they are poor, or if rich, because they have no health to enjoy their riches, they whine because it is too shiny; they whine because it is too rainy; they whine because they have "no luck" and others' prosperity exceeds theirs; they whine because some friends have died and they are still living; they whine because they have aches and pains, and have aches and pains because they whine, and they whine; and they whine no one can tell why. Now, we would like to say a word to these whining persons:

First. Stop whining that is no use, this everlasting complaining, fretting, scolding, fault-finding and whining. Why you are the most deluded set of creatures that ever lived. Do you not know that it is a well settled principle of physiology and common sense, that these habits are more exhaustive of nervous vitality than almost any other violation of physiological law? And do you know that life is pretty much as you take it and make it? You can make it bright, sunshiny, or you can make it dark, shadowy. This life is meant only to be disciplinary—to fit us for a higher and purer state of being. Then stop whining and fretting, and "go on your way rejoicing."

THE HUMAN HEART is like an artist's studio. You can tell what the artist is doing, not so much by his completed pictures, for they are mostly scattered at once, but by the half-finished sketches and designs which are hanging on his wall. And so you can tell the course of a man's life, not so much by his well-defined purposes, as by the half-formed plans—the faint day-dreams which are hung in the chambers of his heart.

LAZINESS grows on people; it begins in cobwebs, and ends in iron chains. The more business a man has, the more he is able to do; for he learns to save his time.

THE looking forward to enjoyment don't pay. From what I know of it, I would as soon chase butterflies for a living or bottle moonshine for a cloudy night. The only way to be happy is to take the drops of happiness as God gives them to us every day of our lives.

DARK HOURS.—To every man there are many, many dark hours, when he feels inclined to abandon his best enterprises,—when his heart's dearest hopes appear delusive,—when he feels unequal to his burdens,—when all his aspirations seem worthless. Let no one think he alone has dark hours. They are the common lot of humanity. They are the touch-stones to try whether we are current coin or not.

PACIFIC BUSINESS COLLEGE,

Mechanics' Institute, 27 Post Street,

BET. MONTGOMERY AND KEARNY, SAN FRANCISCO.

This College is now entering upon its sixth year, and is acknowledged to be the most thorough and practical Business Training School on the Pacific Coast.

Book-keeping, Penmanship, Commercial Arithmetic, Business Correspondence, Commercial Law, Telegraphing, Business Practice, Importing and Jobbing, Commission, Banking, Railroad, Political Economy, Orthography, Customs of Trade etc.,

thoroughly taught and illustrated. This is the MODEL TRAINING SCHOOL FOR BUSINESS on this coast, having the greatest corps of Professors and Teachers, and the greatest number of students in attendance of any in situation of the kind on the Pacific Coast.

THE PENMANSHIP DEPARTMENT,

of this Institution has a wide reputation for its completeness and thoroughness of instruction. Teachers of Penmanship can here perfect themselves for the most artistic execution of penmanship of all kinds.

Young men flock to this Institution from all parts of the Pacific States and Territories, British Columbia, Mexico, the Sandwich Islands and South America.

MR. M. K. LAUDEN, the founder of Business Colleges on this coast, gives his whole attention to this School—the Sacramento College having been consolidated with this, he is now prepared to make this the

Great Practical Business Training School.

Complete Volumes—Bound or unbound—of the SCIENTIFIC PRESS from Jan. 1, 1864, to date, can be had at reasonable rates at this office. They contain much valuable information.

HARD TIMES AND HIGH PRICES.

If there be anything especially notable at this time it is dearth of occupation. We have in San Francisco alone, ten thousand persons struggling against the force of a downward pressure, which may have long continuance. Small shopkeepers, innumerable, find business departing and high rents eating them up. Lodging houses numbered by thousands are half empty. A large army of speculators is sorely oppressed with homestead lots, falsely, so called, that show no prospect of having any value in our time.

It is time that such people he-think themselves about the future. Large numbers of people now in this city, would probably leave it, if they could be brought to see that their available money will be all spent in holding on for the expected revival. For four years past we have done little but puff up the bladder and admire its apparent increase of dimensions. We have been preparing for a rush of strangers eager to buy at any price. Our large land owners have driven off emigration, by holding for prices impracticable. No state in the Union, of the same population, and the same agricultural area, and so restricted a market, sets anything like such prices on land, naked, fenceless, treeless and waterless. Expected buyers have not come this way nor are they likely to. Meantime these large landlords have been borrowing, to hold on, instead of selling to pay off. So far the assessment system has made poor people pay the fair taxation due by the rich. This is at an end. Fair valuations are about to compel the subdivision of land, to the great benefit of the State.

If our remarks are justly founded, we can earnestly counsel the surplus population of our city to seek the country, and large land owners will see their interest in subdividing and pricing, so as to retain the population we have. For if the high price of land drive our own people away, it will be long before strangers will come to a place which their reports condemned. Pretty nearly all the fancy men who can be tempted to pay fancy prices, are already accommodated; and if we want to meet the requirements of the times, we must make our prices square with the public necessities. The gas that has been inflating the bladder must be let out. "The great rush" has not come and no one is so blind as not to see that it is not going to come, till the gas is out, and our prices square with those of other states. During the past season one real estate house has spent \$600 in advertising lands in the vale of Napa without finding a single person to buy at the asking prices!

Now let us suggest that those who want to sell land, will put it at prices to induce the current of buyers to come to our State. When the tide turns, prices may stand a gradual advancement, till, in time, present impractical valuations may be regained.

THE AMERICAN PRESS IN EUROPE.—Dr. Lœckler, in a lecture recently delivered in Berlin, on the "Influence of the Press," gives an interesting sketch of the history of the newspaper, and pays a special compliment to the progress of the American newspaper press. He regards the weekly edition of the New York Tribune as the very climax of the newspaper enterprise of the age, and tells his public that this edition of the Tribune weighs fifteen tons, and that if the numbers were placed one upon the other they would make an immense pillar, having a base of six German feet broad, and a shaft of one hundred and forty German feet high!

OPPOSED TO RAILROADS.—Nathan Hall, of Durham, Conn., in 1833, thanked God that he lived "in a hilly country, where it was impossible to build railroads." To-day the cars of the Air Line Railroad run through the door-yard of his place, between his house and barn, and within four feet of his side door.

PATENTS & INVENTIONS.

Full List of U. S. Patents Issued to Pacific Coast Inventors.

(FROM OFFICIAL REPORTS TO DEWEY & CO., U. S. AND FOREIGN PATENT AGENTS, AND PUBLISHERS OF THE SCIENTIFIC PRESS.)

FOR THE WEEK ENDING JANUARY 31ST.

HORSE HAY-RAKE.—Olpha Bonney, Jr., San Francisco, Cal.

DISINFECTING AND VENTILATING BURIAL VAULTS.—Benjamin F. Lyford, San Francisco, Cal.

FEEDING MECHANISM FOR SEWING MACHINES.—Walter B. Higgins, San Francisco, Cal.

ELECTRO-MAGNETIC SEWING MACHINE.—George Stevens and Joshua Hendy, San Francisco, Cal.

NOTE.—Copies of U. S. and Foreign Patents furnished by DEWEY & CO., in the shortest time possible (by telegraph or otherwise) at the lowest rates. All patent business for Pacific coast inventors transacted with greater security and in much less time than by any other agency.

MILLS IN THE STATE.—There are 158 grist mills in the State, with an aggregate of 358 run of stones. Seventy of these mills are driven by steam and 88 by water. Their aggregate cost was about \$2,000,000 and their capacity 16,000 barrels of flour.

The number of saw mills is 417; of which 231 are driven by steam, and 196 by water. Their cost was about \$3,620,000, and their daily capacity 4,300,000 feet of lumber.

There are seven woolen mills in the state; but the statistics with regard to their capacity or production is very meagre.

There is one knittling mill, one haggling mill, and one rope manufactory, all run by steam.

The quartz mills number 422; of which 207 are operated by steam, 198 by water and 17 both steam and water,—using the former only when the latter fails. The aggregate number of stamps is 4,673. The aggregate cost of the quartz mills has been about \$6,500,000. Nevada is the leading county for quartz mills, Tuolumne second and El Dorado next.

CENTRAL PACIFIC EARNINGS.—The annual earnings of the Central Pacific railroad, for five years, are set down as follows, commencing with 1865:—\$401,941; \$864,917; \$1,421,525; \$2,300,767; \$5,670,882, and closing with the earnings of 1870, at the enormous sum of \$7,920,708. This is certainly a most favorable showing. If the business continues to increase in the same ratio, the earnings for 1871 will be not less than \$10,000,000. One of the most important features connected with this exhibit is the fact that of the earnings for 1870, about 65 per cent. was for local traffic.

DISTINCTION BETWEEN ANIMALS AND VEGETABLES.—Professor Rolleston, of Oxford, in his late book on "Forms of Animal life," gives a new criterion by which to distinguish animals from vegetables. He says that in the case of all animals the embryo absorbs its yolk from the inside, while in vegetables the germ of the seed is surrounded by its albumen. This is a foreshadowing of the way in which the adult animal or plant absorbs its food; the former places it within itself for digestion and assimilation, while the latter takes it from outside.

THE DOLLAR ENGINE.—Our mechanical department is in receipt of this ingenious toy, which is a reciprocating engine, with cylinder, piston, fly-wheel, hoiler and patent safety-valve, yet weighs less than four ounces and can be covered with a tumbler. It is said to make over a thousand revolutions per minute, and to be upwards of 500-feet power. This last is a mistake in part. Its attractive power may be greater, but the repulsive power of 500 fleas, we speak feelingly, can't be equaled by any engine yet invented. Sent by mail (the toy, not the fleas), prepaid, on receipt of \$1.30, by Colby Brothers & Co., 508 Broadway, New York.

VAN NOSTRAND'S

Electric Engineering Magazine,

Commenced January, 1869.

Consists of articles selected and matter condensed from all the Engineering Scientific Serial publications of Europe and America.

The third volume of this Magazine is completed by the issue for December.

The growing success during the past two years demonstrates the correctness of the theory upon which the enterprise was founded. Communications from many sources prove that the Magazine has met a widespread want among the members of the engineering profession.

A summary of scientific intelligence, selected and sifted from the great list of American and European scientific journals is at present afforded by no other means than through the pages of this Magazine.

In the next volume, beginning with the January number, we shall commence some important improvements. Each number of the Magazine will hereafter contain something of value relating to each of the great departments of engineering labor.

More space than heretofore will be devoted to short discussions or elucidation of important formulae, especially such as have proved valuable in the practice of working engineers; our facilities for affording such items are extensive and rapidly increasing.

The progress of great engineering works in this country will be duly chronicled.

Selected and condensed articles, with their illustrations, from English, French, German, Austrian, and American scientific periodicals, will contribute to make this Magazine more than ever valuable to the engineering profession, and will afford a compilation without which the library of the working engineer will be incomplete.

112 Pages, Large 8vo. Illustrated Monthly.

Price \$5.00 a year in advance, single copies fifty cents.

Notice to New Subscribers.

Persons commencing their subscriptions with the 3d year (January, 1871), and who are desirous of possessing the work from its commencement, will be supplied with Volumes I., II., and III., neatly bound in cloth, for \$10.00, sent free by mail on receipt of price.

Notice to Clubs.

An extra copy will be supplied gratis to every club of five subscribers at \$5 each, sent in one remittance.

D. VAN NOSTRAND.

Publisher, Importer and Bookseller, 23 Murray and 27 Warren street, NEW YORK. 5v23-4t

THE SCIENTIFIC PRESS.

U. S. & FOREIGN

PATENT AGENCY,

ESTABLISHED IN 1860,

Is now the principal office West of the Mississippi River. By long and faithful attention

Messrs. Dewey & Co.,

Have built up an extensive business, and gained a large and successful practice and experience, which enables them to render greatly superior service to

Pacific States Inventors,

who can depend upon their advice regarding the patentability and worth of their inventions, the correct drawing up of their specifications in order to secure their full rights under firm patents which will stand the test of law in case of infringement by others.

Inventors securing really valuable claims through our Agency, will have our influence free in making the merits of their patents widely known through the columns of the press—the best authority and medium of recommendation in such matters on this coast.

If you have a valuable invention place it only in the hands of first class, responsible agents, who do not, for the want of experience or ability, assume false airs of superiority and dignity, nor exact exorbitant charges on account of transacting a limited business.

Circulars of Advice Free.

Our 48 page circular will be furnished free on application. It contains extracts of the Patent Law, 112 illustrated mechanical movements; hints to inventors, and much other desirable information concerning the obtaining of patents, etc., for inventors and patentees.

OUR FOREIGN PATENT CIRCULAR (free) gives information concerning the requirements of Foreign Governments regarding the granting and working of patents. THE SCIENTIFIC PRESS and the PACIFIC RURAL PRESS, both first class 16 page papers, are published at \$4 per annum each, by

DEWEY & CO.,

Patent Agents, Engravers and Publishers, No. 414, Clay st., San Francisco.

PHOTOGRAPHY.—FOR CABINET PHOTOGRAPHS, or Enamelled Cards, of the very best quality, you must go to the NEW YORK GALLERY, Nos. 25 and 27 Third street, San Francisco. Every picture warranted to give satisfaction. 0v13-6m B. F. HOWLAND

PERSONAL.—MR. L. P. McCarty, now traveling agent for the SCIENTIFIC PRESS of San Francisco, (by the way, an excellent paper), has succeeded in getting quite a number of subscribers.—Tolo Dem.

SUCCESS IN BUSINESS.—Success in the business world usually depend upon being thoroughly prepared for its duties. Young men! if you would succeed in your business career, secure a good practical business education. This question being settled, the next is where to go. Why, go to the best, of course. Go to HEALD'S BUSINESS COLLEGE, located in the new College Building, 24, Post Street, San Francisco. This is the only school upon the Pacific coast where young men can depend upon being thoroughly fitted for Bankers, Merchants, Clerks, and Book-keepers. This school is connected with the "International Business College Association" or Bryant & Stratton chain. Its scholarships are good for tuition in any of the forty colleges, located in all the leading commercial cities of the United States and Canada. There are many interesting features about the school which can not be discussed here. Call at the College and examine its workings. If unable send for circulars and HEALD'S COLLEGE JOURNAL, which will be sent free upon application. Address, E. P. HEALD, President, Business College, San Francisco, Cal. 23v22-3msm

MARAVILLA COCOA.—For Breakfast.—The Globe says: "Various importers and manufacturers have attempted to attain a reputation for their prepared Cocoas, but we doubt whether any thorough success has been achieved until Messrs. Taylor Brothers discovered the extraordinary qualities of 'Maravilla' Cocoa. Adapting their perfect system of preparation to this finest of all species of the Theobroma, they have produced an article which surpasses every other Cocoa in the market. Entire solubility, a delicate aroma, and a rare concentration of the purest elements of nutrition, distinguish the Maravilla Cocoa above all others. For homeopaths and invalids we could not recommend a more agreeable or valuable beverage." Sold in packets only by all Grocers, of whom also may be had Taylor Brothers Original Homeopathic Cocoa and Soluble Chocolate. Steam Mills—Brick Lane, London. 15v20-7

DEWEY & CO. Publishers, Patent Agents, and Engravers, 414 Clay Street, S. F.

AGENTS WANTED FOR

Zell's New Encyclopedia.

This work, the Best, the Latest, and the Cheapest ever published. It is not only a COMPLETE ENCYCLOPEDIA, Freshly written, and up with the times, but is also a thorough and complete

Lexicon, a Gazetteer of the World, a Biographical, Bibliographical, Legal and Medical Dictionary,

And the only book ever published containing all these subjects, with 2,000 Engravings. This really wonderful work is to render readily accessible reliable information on every conceivable subject. No human being could be found to whom it would not prove invaluable. It minutely describes every disease flesh is heir to; explains every legal term or phrase; gives the geography of the entire world; acquaints you with all noted men and women living or dead; describes every country, city and town; defines every word in use in the English language; pictures the birth-place and gives portraits of many distinguished personages; teaches the correct pronunciation of proper names; is a biographical dictionary of all nations; a biblical dictionary; describes every animal known to exist; acquaints you with authors, sculptors, travellers, warriors, painters, divines, historians, naturalists, etc., of ancient and modern times; speaks of all the battles and heroes of the late war; and explores the whole vast vegetable kingdom.

AGENTS WANTED.—Apply to F. DEWEY & CO., 546 California Street, San Francisco, General Agents for the Pacific States, and Territories. 19v21

PAPER-BOATS.

Have been rowed by the winners of NINETEEN races since their introduction in 1868. In January next, will be published our ILLUSTRATED CATALOGUE AND OARSMAN'S HANDBOOK FOR 1871, which in addition to containing fine wood cuts of our boats and latest improved models, will give

A complete list of all the Boat Rowing and Sporting Clubs in the U. S. and Canada,

besides much other information of interest to oarsman. Every one interested in boats or rowing could have a copy. For catalogues, circulars and price list, address

WATERS, BALCH & CO.,

23v24-3m

303 River Street, Troy, N. Y.

The Great Family Medicine.

TAKEN INTERNALLY, it cures sudden Colds, Coughs, Croup, Weak Stomach, General Debility, Nervous Sore Mouth, Canker, Liver Complaint, Dyspepsia or Indigestion, Cramp or Pain in the Stomach, Bowel Complaint, Painters' Colic, Asiatic Cholera, Diarrhea and Dysentery.

APPLIED EXTERNALLY, cures Rheumatism, Boils, and Old Sores, Severe Burns, Scalds, Cuts, Bruises and Sprains, Swelling of the Joints, Ring-Worm and Tetter, Broken Breasts, Frosted Feet and Chilblains, Toothache, Pain in the Face, Neuralgia and Rheumatism. It is a sure remedy for Ague, Chills and Fever.

PAIN KILLER.

Taken Internally, should be adulterated with milk or water, or made into a syrup with molasses. For a Cough, a few drops on sugar, eaten, will be more effective than anything else.

See printed directions, which accompany each bottle. Sold by all Druggists. 4t-1m

THE HESSE GRINDER AND AMALGAMATOR.

This machine is the most complete and desirable grinder and amalgamator now in use. Owners of Quartz Mills and Sulphuret Works will find it greatly to their interests to use this machine. The following are some of its many advantages, viz: The comparatively little power required to run it; the small wear of metal in comparison with other grinders; the large amount of work that may be accomplished in a given time, being about three times the amount usually performed in ordinary pans; the continuous working process, whereby the labor of handling the ore is avoided; the peculiar arrangements and action of the currents in the machine, whereby all the particles of ore are brought in contact with amalgamating surfaces, and are discharged as soon as ground to the required degree of fineness, thus saving an unnecessary waste of power and metal.

IN THE REDUCTION OF SULPHURET ORES,

this machine is especially valuable, the particles are ground exceedingly fine and uniformly sized, which greatly facilitates the concentration of the sulphurets, and leaves them in the best condition for roasting. The Hesse machines are successfully working in several important quartz mills and sulphuret works in this State. For further particulars send for Circular, or apply to

THE WILSON
Patent Steam Stamp Mill

This extraordinary Mill, now so justly popular in the East, is now offered to the miners of the Pacific Coast. Having been in operation now for about two and a half years, the Company feel confident that the

WILSON STEAM STAMP MILL,

For Durability, Efficiency,

AND ECONOMY OF WORKING,
HAS NO EQUAL.

The Wilson Steam Stamp Mill is the only Steam Mill that has had the severe ordeal of practical working, and proved itself eminently successful. It is now in operation in several of the Eastern States and Territories, and gaining an enviable popularity. The whole machine is so simple as to be readily understood by the most ordinary minds. In fact, its simplicity is its durability. The expense of crushing rock or cement with this Mill is less than one-half the expense of any other Stamp Mill, and less than one-half the cost. For further particulars inquire of

FURMAN K. WILSON,
San Francisco,
Or of THE WILSON STEAM STAMP MILL CO., 326 Walnut street, Philadelphia, Pa.

NOTICE.—All persons are hereby warned not to manufacture or use any Steam Stamp Mills that are an infringement on the Wilson Patents, as they will be prosecuted to the utmost rigor of the law.

F. K. WILSON,
Supt. W. P. S. S. M. Co., Philadelphia.

2v22-1yus 41 First st., San Francisco.

Varney's Patent Amalgamator.

These Machines Stand Unrivaled.

For rapidly pulverizing and amalgamating ores, they have no equal. No effort has been, or will be spared, to have them constructed in the most perfect manner, and of the great number now in operation, not one has ever required repairs. The constant and increasing demand for them is sufficient evidence of their merits.

They are constructed so as to apply steam directly into the pulp, or with steam hotions, as desired.

This Amalgamator Operates as Follows.

The pan being filled, the motion of the miller forces the pulp to the center, where it is drawn down through the aperture and between the grinding surfaces.—Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly passing a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.

Softers made on the same principle excel all others. They bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed.

Mill-men are invited to examine these pans and settlers for themselves, at the office, 229 Fremont Street, San Francisco.

WIESTER & CO.,
17 New Montgomery Street, (Grand Hotel), San Francisco.**Logan's Rubber Back Lash Spring**

Patented May 17, 1870. The attention of Manufacturers and Mill Owners is respectfully called to the above valuable invention for

Preventing Back Lash in Mill Gearing.

No argument is deemed necessary to convince an intelligent Miller of the importance of preventing back lash, as it is well known that both the quantity and quality of the flour depends largely upon the steadiness of motion of the Burrs. Whenever the motion is communicated by an engine having two points in the revolution of the Fly-Wheel where no power is applied, there must be an unequal motion, and consequently more or less back lash. By the use of every heavy fly-wheel or a high speed, this inequality of motion may be diminished but it cannot be entirely prevented, and more steam will be required than with a lighter fly-wheel or slower speed. By the use of

Logan's Patent Rubber Springs,

the Back Lash is entirely prevented. The pinion being loose upon the spindle, and the connection between them being by the springs, the action of the springs keeps the eggs of the pinion at all times firm against those of the driving wheel, while a continuous forward pressure is given to the spindle and through it to the Mill-Stones.

The Right to the Pacific Coast is placed in our hands for sale at a very low price. Parties interested will please write for descriptive circular or call at our office and examine the model. A large number have already been sold and put into use in the Eastern States, and three are in daily use in a flour mill in this state. Parties buying territory will be furnished with the springs at manufacturing cost from the Factory in Illinois, or will be furnished with a sample to manufacture from free of charge.

The Babcock Fire Extinguisher.

The Babcock Extinguisher, says the Secretary of the company owning the patent, is offered to the public, as a means not of extinguishing large conflagrations, but of preventing them. This seems to us a very fair claim. Many fires often end in fearful calamities which might easily be extinguished if taken in time; and in the case of small fires, where the steam-engine has stopped any progress of the flames, the damage done by water is often equal to what would have been caused by fire. Hence some such apparatus as this would appear very desirable; and this apparatus certainly seems to have fulfilled all the necessary requirements in very many cases.

The Extinguisher is simply a device for generating carbonic acid, saturating water with this powerful foe of the fiery element

and throwing the mixture to any point where it is required. The small cut shows the section of the apparatus. The leaden bucket, A, holds the charge of acid, and is kept in its upright position by the stopper, O, attached to the rod, B, coming through the cap, C. To prepare the Extinguisher for use requires about one minute. The directions are: Dissolve the contents of white package in water and pour into the Extinguisher—fill the Extinguisher with water to within three inches of the top. Pour the contents of glass bottle (acid) into leaden bucket, put in the stopper firmly, insert bucket in the Extinguisher and screw down cap hard and tight. In this condition it may be placed in position most accessible in case of fire, where it may remain any length of time, always ready for immediate use. In case of fire, pull up the knob, H; this draws out the stopper O, and the bucket, A, turns bottom side up, as shown by the dotted lines, R, being only supported after the stopper is withdrawn by pivots, P P, thus discharging its contents into the carbonated water. Instantaneous and powerful chemical action takes place, supplying sixty to ninety

pound pressure to the square inch to throw the stream, and securing perfect readiness to play upon the fire in ten seconds of time.

The larger engraving shows the way in which the machine can be transported by a man and used effectively wherever needed.

According to the accounts which we have received, this apparatus has proved a decided success. We have a list of 210 fires arrested and put out by the simple contrivance. It is estimated that the value of property saved by its use, during the past year, amounted to four millions of dollars. Government has adopted it in a number of cases, we are told. The Chicago Fire De-

partment has, by formal resolution, attached two of the Extinguishers to each hook and ladder truck, and detailed men for using them. Three times this machine has put out fires in the Chickering Piano Forte Factory in Boston. Tiffany & Co., the New York jewelers, and Frank Leslie, the publisher, acknowledge its good offices in their particular cases.

Many of the leading railroads at the East use the device. The Michigan Central saved three cars last September. Where water cannot readily be obtained, as in the case of persons residing in the country, the machine must be especially valuable. In mills, or steamers and elsewhere it has done good service. The testimonials as to its good work are very strong.

THE BABCOCK FIRE EXTINGUISHER.

The device is easily managed; all that the person carrying the machine has to do is

are exposed to deadly dangers every moment, procrastination seems but little better than murder. Either clean out the Indians, or else give up the country to them. If the government would furnish arms to the people, with perhaps a few officers who should have limited power, we should be willing to leave the matter entirely to the Arizonian volunteers.

REDUCTION OF FARE.—The price of tickets on the immigrant trains, between Omaha and San Francisco, is reduced from \$72 to \$50.

THE ANCIENTS employed only convicts as miners, just as in Russia political and other offenders are sent to the Siberian works. In San Domingo and Hayti, the Spaniard sent to the miners the natives, whom their bloodhounds had not killed or hunger destroyed.

COPPER.—The price of copper in England, according to Lewis and Son's Annual Report, has been steadily decreasing since 1864. But the prospects of the trade are now much better than they were twelve months ago. The production of Chile, in 1869, reached the enormous amount of 55,000 tons fine per annum, but has now diminished to about 49,000 tons, with every prospect of a further decline. Should the present war soon cease, it is probable that better prices will rule, for there has been a decided increase in consumption, witness the extended manufacture of telegraphic cables, which are largely composed of copper. There were imported into Liverpool,

Swansea and Loudon, during 1870, 60,652 tons fine of copper. The quotation for ore on Dec. 31st was \$3.12½ per unit.

STATE UNIVERSITY.—The Board of Regents met on the 7th inst. It was decided to purchase the portion of the Brayton estate necessary to complete the square on which the preparatory departments of the University are situated, for \$20,000; also to proceed with the erection of the Agricultural College building until the basement is completed. Dr. Taylor, of Santa Barbara, offered to sell to the University his manuscript copy of the Bibliography of California. The proposition was referred to the Committee on Libraries.

DURING the last fifty-one years, seven and a half million immigrants came to the United States.

MECHANICAL PROGRESS.

WEIGHT AND SHORT STROKE FOR HIGH SPEED.—The *Engineering and Mining Journal* prints a paper, read by Chas. T. Porter at a late meeting of the Polytechnic Club of the American Institute, which attracted much attention. He took the ground that the reciprocating parts of an engine, at the instant when the direction of their motion is reversed, exert a force which is precisely the same centrifugal force that would be exerted by them continually if they were revolving with the crank. Therefore, by combining rapid speed and short stroke with considerable weight in these parts, their centrifugal force may be developed to whatever extent we choose, and, if it is in excess of the force of the steam, the engine with the steam turned on, becomes in effect a rotary engine. We have not space for Mr. Porter's demonstration, but give his conclusion:—"The crank passes the centers under a strain not wholly relieved; the force of the steam does not reach the crank at these points, but is absorbed in the mass, and is afterwards gradually imparted to the crank during the stroke. The value of this action it is difficult to estimate too highly. By means of it the shock of the steam on the centers is avoided wholly or in a degree, the excessively intermittent pressure caused by working steam at a high grade of expansion is transformed, as by magic, into a steady and uniform rotative pressure on the crank, the fly-wheel is relieved of its most trying offices, the shaft from the excessive torsion in alternate directions that is produced by its action, and a smooth and gliding movement is attained, with a closer approximation to uniform motion than the crank has been supposed to be capable of giving. It is curious to observe how exactly opposite to the truth all the engineering traditions on this subject turn out to be. We have been taught that the reciprocating parts of an engine were passive on the centers, that the great difficulty encountered in the attempt to employ high speed was the necessity of reversing their motion, that they should therefore be made as light as possible, and long strokes should be employed, so that the changes in the direction of their motion might be as few as possible. Now we know that their centrifugal action on the centers is all important to a high speed engine, and that to render this most serviceable we must employ considerable weight and a short stroke. The field is a large one; I limit myself to the fundamental principle which I have endeavored to explain. This being established, all theoretical objection to the employment of high speed vanishes. When the dead center is stripped of its imaginary terrors, we must perceive the dawn of a new day in the history of the steam engine."

STEEL TIRES UNDER BRAKES.—It has always been understood in Prussia, that cast-steel tires should not be applied to wheels running under brakes. "The cast-steel tires, when checked by the brake and skidding upon the railway, get very hot by friction; in pulling up in a pool of water, a heap of snow, or even in a keen draught of wind, a cast-steel tire may, under such circumstances, get a hard chill or brittle temper, and, being so injured and deprived of elasticity, it may break at any time, either while running free or under a brake, and that without giving previous sign of existing danger." So says a correspondent of the *London Engineer*.

CHLORAL HYDRATE IN PHOTOGRAPHY.—The *Photographische Archiv* mentions, that to freshly prepared and slightly colored collodion (iodo-bromized) one per cent. of chloral hydrate was added. With a neutral silver bath it gave a good white film. The developer consisted of sulphate of iron and acetic acid. The plates were considerably more sensitive than those prepared without the chloral hydrate. The plates worked very clean.

IMPROVEMENTS IN PROJECTILES.—"An English device consists in applying the projective force by means of an annular cartridge approximately to the center of gravity of a hollow cylindrical or tubular projectile, instead of, as is usual, at the base; a rotary motion being, if desired, imparted to the projectile by rifling it externally and internally. The projectile or shot is in the form of a hollow cylinder, thus destroying the vacuum in the rear of the shot, and is of the same internal diameter throughout its length and for part of its length, such part being the rear end of the shot, of the same thickness."—*Sci. American*.

PROGRESS IN IRON SMELTING.—The following is a condensed extract from an article in *Engineering Progress* for Jan. 6, under the head "Engineering Progress, 1866-70":—"A few years ago the experience of iron smelters seemed to indicate a tendency to an almost unlimited increase of sizes of blast furnaces and temperature of blast. With a view to economy of fuel, furnaces exceeding 100 ft. in height have been built in the Cleveland district, and hot blast stoves have been set to work, which are capable of sending a blast of 1200 degrees and more into the furnace. The researches of Mr. Isaac Lowthian Bell have thrown a new light upon this subject, and the blast furnace has become an object of investigations, which will probably effect a beneficial change from routine to scientific management in iron smelting works. Mr. Bell has pointed out that there are certain limits to the sizes of furnaces and temperature of blast, which cannot be exceeded with beneficial results as regards economy of fuel. Mr. Bell's researches are still in progress, and they promise to become the foundation for a new and complete theory of the blast furnace, hitherto the least understood of all metallurgical branches. The records of the Patent Office show an entirely new train of thought underlying a great number of recent specifications referring to metallurgical inventions. The reductive influence of carbonic oxide and other gases which form the internal atmosphere of a blast furnace, is applied to the reduction of iron ores in many ways hitherto unattempted. Experiments are being conducted to bring these ideas to a practical test, and a new road of progress is being vigorously followed as a consequence of the new theories recently propounded. The researches above referred to are confined to the question of economy of manufacture, and principally economy of fuel."

UTILIZING WASTE HEAT FROM STEAM BOILERS.—A Vermonter has patented a method which consists in having a second boiler, filled with bisulphide of carbon, which boils at about 110 Fah., and heated by the exhaust steam from the first boiler. The vapor of the bisulphide of carbon was condensed in a short copper coil immersed in a tank of water, and pumped back into its boiler with no perceptible loss. To each boiler is attached an engine. The *Scientific American* notes a trial as follows: "The pressure in the steam boiler having been raised to 45 pounds, the steam engine was started, raising with the derrick a weight of 500 pounds. In five minutes after, the pressure in the bisulphide boiler went from 0 to 30 pounds to the inch. At this time the second or bisulphide engine was started, geared to a derrick, and commenced raising a weight of 500 pounds in the same manner that the steam engine was doing. The two engines were kept running simultaneously two hours, and during this time the steam engine made 38,000 revolutions, and raised 500 pounds 456 feet, while the bisulphide engine made 44,000 revolutions, and raised 500 pounds 528 feet. The pressure in the steam boiler ranged from 30 to 70 pounds to the inch, averaging about 45 pounds, and the pressure in the bisulphide boiler ranged from 30 to 60 pounds, averaging about the same as that of the steam boiler."

PEAT—THE OTHER SIDE.—It is but fair that we now quote a single word on the negative side of the question. The *Boston Journal of Chemistry* for February, says: "Dry compressed peat affords less than one half the heat afforded by anthracite coal of equal weight; and it has the disadvantages of giving off an exceedingly unpleasant odor, and leaving a huge mass of light and troublesome ash. It cannot be dug out, dried, and compressed for any sum that will bring it into competition with coal, and therefore it is preposterous to give the matter any further attention. There has been lost by victims of the peat delusion, in New England alone, nearly a million of dollars, and this has gone into the pockets of the owners of 'patent peat machines,' and speculators interested in keeping up the excitement."

TOUGH IRON.—The spathic iron furnaces in Plymouth, which draw from the only large mine of this peculiar ore in the United States, make iron so tough that a hundred sledge hammer blows are required to break a bar of the pig, while ordinary iron can be broken by half a dozen. They use this year nine thousand cords of hard wood in charcoal, and make six tons of iron a day.—*W. S. R. R. Register*, Dec. 24th.

SCIENTIFIC PROGRESS.

DARWIN'S LATEST.—Appleton & Co. give extracts from advance-sheets of Darwin's new work on "The Descent of Man" &c. We quote: "The early progenitors of man were no doubt once covered with hair, both sexes having beards; their ears were pointed and capable of movement; and their bodies were provided with a tail, having the proper muscles. Their limbs and bodies were also acted on by many muscles which now only occasionally reappear, but are normally present in the *Quadrumanus*. * * The most ancient progenitors in the kingdom of the Vertebrata, at which we are able to obtain an obscure glance, apparently consisted of a group of marine animals, resembling the larvae of existing Ascidians. These animals probably gave rise to a group of fishes, as lowly organized as the lancelet; and from these the Ganoids, and other fishes like the *Lepidosiren*, must have been developed. From such fish a very small advance would carry us on to the amphibians. We have seen that birds and reptiles were once intimately connected together; and the *Monotremata* now, in a slight degree, connect mammals with reptiles. But no one can at present say by what line of descent the three higher and related classes, namely, mammals, birds, and reptiles, were derived from either of the two lower vertebrate classes, namely, amphibians and fishes. In the class of mammals the steps are not difficult to conceive which led from the ancient *Monotremata* to the ancient *Marsupials*; and from these to the early progenitors of the placental mammals. We may thus ascend to the *Lemniscide*; and the interval is not wide from these, to the *Simiade*. The *Simiade* then branched off into two great stems, the *New World* and *Old World* monkeys; and from the latter, at a remote period, Man, the wonder and glory of the Universe, proceeded."

TUBERCLE GERMS.—We take the following from an article by Lionel S. Beale, F. R. S., which we find in the *Bowdoin Scientific Review*:—"There is reason to think that particles of living growing tubercle exist sufficiently minute to be supported by the atmosphere and carried long distances; while there are many facts which are considered by some sufficiently conclusive to justify the opinion that tubercular disease of the lungs is at least in some instances contagious. And it is certain that the most recent observations in connection with the subject of the nature and mode of propagation of tubercle, so far from militating against this view, tend rather to support it."

FUSION OF IRIOSMINE.—The following is one of the items of scientific news presented at a late meeting of the Polytechnic Club of the American Institute:—Mr. M. G. Farmer, of Boston, has succeeded in fusing iridosmine by a current of voltaic electricity from sixty large Bunsen cells. Grains of the mineral were placed in a groove made in charcoal, each end of which was connected with a large platinum wire. The temperature of fusion was estimated at about 10,000° Fahrenheit. His object was to obtain a pure alloy of iridium and osmium, to be used in electric illumination. On bringing one square inch of the alloy to near the fusing point, by means of an electric current, he found the light emanating from its surface equal to 2,800 candles. This new light threw shadows at midday, and had sufficient actinic power to produce excellent photographs.

GLYCERINE EXTRACT OF PEPSIN.—A short time ago Von Wittich published in *Pflüger's Archiv* some interesting results of an attempt to isolate, by means of concentrated glycerine, pepsin and other so-called ferments found in animal and vegetable bodies. The mucus membrane of a pig's stomach, washed and freed as much as possible from water, was finely minced and bruised, and then covered with pure glycerine. After standing twenty-four hours, a few drops of the glycerine, diluted with acidulated water, digested fibrin with remarkable rapidity. After pouring off the whole of the glycerine, a second, third, and even fourth glycerine extract could be made, all manifesting strong peptic powers. On treating, after filtration, these glycerine extracts with a large excess of alcohol, a slight precipitate was obtained, which, separated by filtration and re-dissolved in acidulated water, though giving only the faintest proteid reaction, was strongly peptic. In a similar manner sali-

vary gland and pancreas gave up to glycerine a starch-converting ferment; and almonds a ferment capable of acting on amygdalin.—M. Foster says, in *Nature*, "We certainly have in glycerine a new means of working out the intricate problems of these so-called ferments. The means hitherto adopted of preparing the so-called pepsin for medicinal purposes are confessedly clumsy and inefficient. By glycerine we can now extract, without any trouble whatever, a pure palatable peptic liquid, one which apparently will last any length of time."

FRANKLAND ON SPONTANEOUS GENERATION.—In *Nature* of Jan. 19th, Dr. E. Frankland details some experiments recently undertaken by him to refute the arguments of Dr. Bastian, who maintained that he had seen living organisms generated from non-organized matter, while Prof. Huxley considered that such a conclusion was not admissible, and declared that the motion of the particles was not proof of life. Prof. F. half filled four glass tubes with a liquid consisting of carbonate of ammonia 15 grs., phosphate of soda 5 grs., and distilled water 1 oz. The tubes were then hermetically sealed and exposed for four hours to a temperature of 155° to 160° C., in a digester; then cooled, and plunged, two of them into concentrated sulphuric acid, and the other two into a saturated solution of carbolic acid. This was to prevent the possible admission of atmospheric germs through invisible cracks in the glass. On Dec. 24th, five months after, during which the cylinders containing the immersed tubes were kept at a temperature of 60° to 70° F., two of the tubes, one from each liquid, were opened in the presence of Prof. Huxley and Mr. Busk, and the contents examined with the greatest care under the microscope. Particles such as Dr. Bastian saw were seen in active movement; and his language is in fact quoted by Dr. Frankland in description thereof. "But," says Dr. F., "the movement of the particles which we observed was obviously mere Brownian motion; and many of the particles were evidently minute splinters of glass. There was not the slightest evidence of life in any of the particles. The water on the slide containing these solid matters was evaporated off, and they were treated with hot concentrated sulphuric acid, the temperature of the slide being raised to about 100° C. There was no blackening, and the rounded and dendritic bodies remained as entirely unaltered as the glass splinters. Indeed, some of the larger spheroidal bodies were evidently rounded particles of glass which had become detached from the inner walls of the tube by the corrosive action of the enclosed liquid at the high temperature to which it had been exposed in the digester."

PROF. YOUNG'S ECLIPSE OBSERVATIONS. Prof. C. A. Young, who observed from Jerez, Spain, writes:—" * * But the most interesting spectroscopic observation of the eclipse appears to me to be the ascertaining at the base of the chromosphere, and of course, in immediate contact with the photosphere, of a thin layer in whose spectrum the dark lines of the ordinary solar spectrum are all reversed. Just previous to totality, I had carefully adjusted the slit tangential to the sun's limb at the point where the second contact would take place, and was watching the gradual brightening of 1474 and the magnesium lines. As the crescent grew narrower, I noticed a fading out, so to speak, of all the dark lines in the field of view, but was not at all prepared for the beautiful phenomenon which presented itself when the moon finally covered the whole photosphere. Then the whole field was at once filled with brilliant lines, which suddenly flashed into brightness and then gradually faded away until, in less than two seconds, nothing remained but the lines I had been watching. The slit was very close, and the definition perfect. * * This observation is a confirmation of Secchi's continuous spectrum at the edge of the sun, and I think tends to make feasible the original theory of Kirchhoff as to the constitution of the sun and the origin of the dark lines in the ordinary solar spectrum."

THE YALE ROCKY MOUNTAIN EXPEDITION.—Sillman's *Journal* for February, says: "The expedition was as a whole very successful, and the large collections made will be placed in the Peabody Museum of Yale College. The more important scientific results will soon be published."

CORRESPONDENCE.

Notes of Travel in Merced County.

[Written for the Press.]

Snelling.

Suelling, the county seat of this county, is situated on the north side of Merced river where the foot hills set in, about 65 miles from Stockton. Its population is about 650. There is a strip of country about 10 miles wide and extending north to the Tuolumne river, that was segregated as mineral land by the original government surveyors, but has since been surveyed and approved by the general government, and the land is now open to pre-emption and homestead. This land was thought to be worthless for anything except grazing until last year. Two years ago this spring, Mr. A. B. Anderson (who is the proprietor of the Galt House, Snelling) as an experiment, summer-fallowed 100 acres of this land, and in the Fall following sowed it in barley, from which, at the last harvest, he gathered 2,300 bushels; and he has just now completed sowing 800 acres of the same kind of land in barley.

From a high point on his land (which I visited), can be seen 20 distinct settlements, nearly all of which have been put up within the last 8 months. Mr. A. gives it as his opinion that this is the surest land for a crop of cereals of any land in the San Joaquin valley, from the fact that it always rains more here than on the level plains. He has sowed, as an experiment, this season, about an acre of the celebrated Norway Oats, and promises that you shall hear the result.

Complicated Fine Ranch.

H. F. Buckley & Bro's. ranch, situated 7 miles south-west from Snelling, and about 1½ miles from Hopeton, is one of the finest I have visited this side of San Joaquin county. It is known as the *Merced Stock Farm*. It contains 1,654 acres, and cost its present proprietors \$27,500. There are 12,000 grape vines, 1,500 peach trees and 2,000 apple trees upon the ranch. Last year, 300 acres of corn were sown, producing 60 bushels to the acre. In good seasons it has produced, and will again produce, 100 bushels per acre.

It is stocked with about 4,000 head of Cotswold sheep, about a quarter of which are thorough-bred, and the remainder is made up of ¼, ½, and ¾ thorough-bred. They expect this year to increase the number to 10,000 head by importation and increase. To go into the pedigrees of even some of this large band, would take more room than the space you allow me for this communication. Suffice it to say that the progenitors of this band have been imported by these gentlemen at great expense, and to those wishing to purchase thorough-bred Cotswold sheep, they need look no further than this ranch.

These gentlemen, together with Mr. J. M. Stroug, proprietor of Coulter's hotel, Snelling, and John L. Strong, of Anaheim, Los Angeles county, (and late of Memphis, Tenn.) will put in 300 acres upon this farm this season in cotton. As the latter named gentleman is thoroughly posted upon this subject, and is furnishing you with intelligent articles upon the matter, I shall not attempt to argue the cotton question, except to explain a few terms used, and answer a few questions as they have been given me.

Objections to Cotton Culture Answered.

My answers to objections will simply be quotations from published statistics of cotton raisers south. The first objection is, it cannot be raised here at all on account of the cold nights, and early frosts. In answer to this, it has been raised here by Mr. J. M. Strong, of Snelling, for three successive years, producing last year at the rate of over two bales per acre (a bale, Liverpool standard, is 443 lbs). While the nights are sometimes cool here, the ground is always warm. As to early frosts, in the Cotton States the average killing frost is about the 10th of October, while here we seldom have any until sometime in Dec.; and, again, it is necessary for the killing of the leaves, where the cotton grows very rank, so as to give the bolls a chance to ripen.

The remaining objections are, that the yield is not sufficient here, nor the staple as long, or the fibre as fine. Cotton pretenders in this country assert, when asked

what an average yield is in the south, "about a bale to the acre." Now, the convention of cotton raisers at Memphis, Tenn., in May, 1869, (which was represented by over 1,000 cotton raisers from all the states south), said that it requires three acres on the average to produce a bale of cotton. The average staple (which is the length of fibre) in the south, according to the same authority, is ¾ of an inch. I have measured it here from a variety of bolls, and it runs from ¾ of an inch to 1¼ inches. Lastly, as to the fineness of fibre, from promiscuous specimens sent from here, cotton commission merchants south pronounce it full middlings. A lot of 1,200 lbs. sent from here to your Oakland manufactory, was stated to be superior to anything they had ever worked, except one lot from the upper Sacramento river, although they were importing from half a dozen countries.

Mr. John Ruddle owns and cultivates, some 400 or 500 acres of very fine land situated between Hopeton and Snelling. Next adjoining him on the N. E., is the ranch of Silas March, containing nearly 1,000 acres. From the looks of his fine residence, he intends to make it his future home. J. J. Montgomery, Esq., is probably the largest land owner in the county. One of his fields is several miles square, all under fence. His speciality is cattle. Skelton, Turner & Co., and Simon Jacobs & Co. are the principal merchants here in Snelling.

Freaks in Nature.

Louis Hadlich, farmer and stock raiser, residing one mile west from Hornitos, in the adjoining county, had a ewe sheep that a few weeks since gave birth to a mammoth lamb weighing 20 lbs. The mother and lamb both died in a few moments afterwards.

J. M. Strong, of Snelling, has just been presented with a chicken, which I shall denominate a hermaphrodite, in the absence of a better term. This fowl is complete in both sexes. It has the comb, and spurs of a rooster, and crows like one; it also lays eggs as regularly as a hen but by trial it has been found that the eggs will not hatch. Please to set your scientific men after this extraordinary fowl.

Merced Falls Woolen Factory.

Merced Falls, 5½ miles from Snelling, on the Mariposa road, is quite a lively little place, and is where the Merced Falls woolen factory is situated. The capital stock of this company, paid up, is \$75,000, all held within the vicinity, except about \$1,500. A. Ingolsby is President and manager. The mill is run by water, from the Merced river. The manufacturing department is superintended by Messrs. Rector & Torr; 36 men and women are regularly employed; some by the day, the balance by the piece. It has been in operation, under its present management, but about 5 months. For the month of Jan. they manufactured 4,161 yds. of flannel, which will wholesale for about 45 cts. per yard; also 4,433 yards of cassimeres, which will wholesale about \$1.00 per yard; and 328 pairs of blankets, worth \$7.50 per pair. When running in their capacity, about 33 per cent. more can be manufactured.

L. P. Mc.

A Huge Manufactory.

[Written for the Press.]

How it Looks and What it Contains.

EDITORS PRESS—Thinking that a few lines concerning the great glass and iron manufacturing center, Pittsburgh, Pa.,—said to be the second city in wealth in the Union,—would be of interest to many readers of your valuable paper, I send you a short account of matters and things as seen through the "optics" of your humble servant.

On last Monday I beheld the noted "Smoky City" for the first time in ten years, and as I had just come from the rural districts of "way down East," my ideas of its cleanliness were not as elevated as they might be. As it was midnight when I arrived, I fully realized the saying of a Boston journalist—James Parton—on seeing the city by night, that it "looked like hell with the lid off." Surely it is a novel and interesting sight, and its like perhaps is not to be seen elsewhere in the United States; and the Bostonian may be pardoned for his trite saying when he beheld around him the lurid flames leaping from hundreds of stacks and chimneys, and heard the puffing of immense engines, the clanking

of powerful machinery and the thud and pounding of ponderous hammers,—hammers capable of striking a blow so light that a watch placed on the anvil might have the crystal broken without injuring the works, or a blow which has the crushing effect of ten or twenty tons, if desired.

To the observant stranger, Pittsburgh presents many things of a curious and interesting character, and no sensible person can look upon them without feeling that he is a wiser if not a better man. Here may be seen rolling mills, glass houses, old forts, a new city hall, handsome bridges, bridges worthy of antediluvian fame, coal pits vertical, and coal mines horizontal, foundries for big guns, a big depot and a bigger elevator, boat houses and celebrated boatmen, sporting men, good and bad, and a penitentiary warranted to reform the most hardened of sinners. It is often styled the Birmingham of America, and I think justly so. It will be remembered that here was cast the largest guns used in the rebellion, such as the Floyd, the Union, the Swamp Angel, and many others. Here also is the great Southern depot for the supply of coal.

Coal—Polished Iron.

Besides the coal used by the different manufactories that have their own coal mines, there was shipped, during the last year, the enormous amount of sixty millions of bushels. The mines being worked at present are those in which the veins of coal run horizontal, from the fact that they can be worked at much less expense than those vertical. Along the sides of the hills, on either side of the river, may be seen queer-looking holes, entrances to these subterranean caverns from which these "black diamonds" are taken. Inclined planes are run from the mouths of the pits to the river below, and, as a consequence, boats are loaded with ease and at small expense. I cannot give statistics of the amount of iron, steel and glass manufactured, but they are, I am assured, quite large. One manufactory—the American Iron Works, of Ormsby Borough, valued at some five millions of dollars,—is capable of turning out, annually, about 50,000 tons of finished iron and nails. If we reduce this to a lesser denomination, it presents the startling amount of one hundred millions of pounds. Connected with this establishment is a machine shop, 450 feet in length by 150 feet in breadth, where one of the specialties of the works,—polished iron,—is manufactured in all its branches. It is secured by letters patent, and has already proven to be of immense value. The old process of polishing iron was by the slow and costly way of hand-power, while by this method everything is done by machinery at fully one-fifth the cost, and, it is claimed, of a superior character. The process is simply immersing the iron in a steam acid bath, and then rolling it between heavy rolls, the same as when hot, a few minutes only being required to polish a heavy bar to the brilliancy of a mirror. It is said that rolling the iron cold improves its texture, making it closer and stronger. These works employ about three thousand men, and their pay-roll often reaches \$200,000 monthly.

Glass—Queer Stories.

In the manufacture of glass,—window and flint ware,—McKee Bros. returned last year \$500,000, and McCully & Co. a like amount. Hussey, Wells & Co., steel works, make a showing of one million dollars; and in copper, C. G. Hussey & Co. foot up a like amount.

This city claims the honor of being the first in this country to erect works for the manufacture of glass, steel and copper; and for the manufacture of these great staples of commerce, including iron, I have not seen, in the many thousands of miles that I have traveled, any other place approaching a comparison.

Many queer stories are told regarding the dirt and smoke of this place, such as, "at noonday, looking at the sun, it appears like a patch of red paint;" and "when a woman loses her child upon the street, in searching for it, if she finds a stray urchin, she has to wash the little one to know whether it is her own or some other person's." These stories have arisen from the fact that there is constantly hanging over the city a dense cloud of smoke, arising from the bituminous coal used by the manufactories, and also that everything outdoors is blackened and begrimed, to a greater or less extent, for the same reason.

J. H. DAVIS.

Pittsburgh, Jan. 18th, 1871.

A Remarkable Body of Water.

Prof. T. P. Stelle gives the following interesting description (in the *Am. Jour. of Microscopy*) of what he saw in the water of a lake in Central Florida.

I turned my attention to the water, and was soon convinced that I had, undoubtedly, met with a phenomenon, for it was so clear, so very transparent, that I could see through it in every direction with as much apparent ease as if it had been the atmosphere itself. Presently I saw one of the inhabitants hinted at, a little creature of a light brown color, looking, as it glided here and there, through the pure element, not unlike a common chimney swallow. Then came another, and another, and another, until all the waters of the lake seemed to be thickly swarming with them. They were very busy and very swift in their motions, darting, whirling, and angling with the greatest ease and the most charming grace; the guide said that like birds of the air they were in quest of their prey, feeding upon animals too small to be seen by us from our standpoint.

Suddenly, while I was gazing in wonder upon these strange creatures, a new actor appeared in the person of a larger animal, about the size, shape, and color of a huge musk melon. He was quite transparent, so much so that I could see through and through him as plainly as if he had been a glass jar; and as he moved leisurely about I noticed that he was catching and devouring the little "swallows" without mercy. His interior, which seemed to be a huge cavity—nothing more—was literally filled with them, some still alive and swimming about in their strange prison. The entire mass held within his gigantic stomach kept up a rapid whirling round and round in one direction, from which I inferred that he had no regular digestive organs, but simply wore out his food; that is, reduced it by friction to a proper condition for his sustenance.

Scarcely had I got fairly interested in this extraordinary animal, when along came something which looked, with its slim, arching neck, very much like a swan. Its course was so directed that ere long it was brought into contact with the "musk melon," and a fight was the consequence. It was a short fight, however, for neither of the parties seemed to relish the business, so they separated and struck off in opposite directions. A little distance, and the "swan" met another of its own kind, and they commenced billing and cooing like two mated doves; but their pleasures were destined to be of short duration, for just at that instant a large and hideous looking creature, with great horns and glaring eyes, pounced upon them from a covert hard by, seizing them both. A terrible struggle ensued, in the course of which one of the "swans" made its escape, but the monster gripped the other fiercely by its slender neck until it ceased to struggle, after which he settled down with it to the bottom of the lake, and very quietly began converting it into a meal.

About this time I noticed a second monster, equally as frightful in appearance as the one just referred to, though evidently of a different species. He was moving along on the bottom of the lake, and, unless his course were changed, would pass very near the other. The first monster's treatment of the "swans" had made me his enemy, so I was well pleased with the turn affairs showed a prospect of taking; I desired that his banqueting should be disturbed. And it was. The new comer found him, and went in for a share of the prey. A battle, the most frightful that I had ever before witnessed between two living creatures, immediately commenced. They seized each other and rolled over and over in a real death struggle, for several minutes, in the course of which they actually tore each other limb from limb. Finally, one of them yielded up and died, after which the other, with but two legs left out of six, dragged itself slowly away. And another installment of animals, some like gigantic leeches, and others like Oriental turbanes, and all effecting locomotion by stretching and pulling themselves into every conceivable shape, settled down and fell to regaling themselves upon the carcasses. They wore, doubtless, the vultures of this remarkable body of water.

A NEW TUNNEL MACHINE, built at the Fulton Iron Works, has just been completed. It is of large size with four drills. It was designed by the Diamond Drilling Machine Company for work on the Blue Gravel Company's tunnel near Smartsville. A trial last week was most satisfactory. We shall speak of it again at greater length.

MINING SUMMARY.

The following information is gleaned mostly from journals published in the interior, in close proximity to the mines mentioned.

California.

ALPINE COUNTY.

ITEMS.—*Miner*, Feb. 4th:—The Schenectady mine looks far better than ever before. The last 20 feet of drift in Monitor No. 3 shows good ore. Fine ore exposed in the Hercules, while blasting for Glohe Co.'s ditch. The same lode was then found in the main tunnel drift, and averaged over \$15 per ton by assay.

TARSHISH.—*Chronicle*, Feb. 4th:—We visited this mine yesterday. Tons upon tons of rich ore lay in the drift, 150 feet above the lower tunnel. The Co. have evidently got into an immense deposit of ore, extending from the point where the connection was made in the shaft to the upper tunnel, a distance of one hundred feet, and extending into the mountain to an indefinite distance. Few mines in the States show better.

MOUNT BULLION.—This tunnel is in 1700 feet. The rock is harder than usual. One hundred feet further will bring it to the Wellington—the main ledge of the Company.

THE GLOBE'S REDUCTION WORKS.—The work on the mill is progressing—the whistle sounded for the first time on Thursday evening. The rest of the machinery is being put in position as rapidly as possible, but the non-arrival of the settlers has retarded operations.

AMADOR COUNTY.

GOOD CLEAN UP.—*Ledger*, Feb. 11th:—The amount of gold obtained from 250 tons of quartz from the Kennedy mine, worked at the Mahoney mill was twenty dollars per ton. This does not include the sulphurets saved which were very rich.

A BIG PROSPECT.—Belding, Hatch & Co.'s shaft is fifty feet deep, and they have a vein of good rock seven feet wide. On the "dump" was three hundred tons of quartz, every piece of which showed more or less rich sulphurets with here and there free gold.

GOING TO WORK AGAIN.—Cosumnes Copper Mining Co. are making preparations to resume operations at Forest Home. They have levied an assessment and contracted for seven hundred cords of wood. We learn that works for reducing their ore at the mine will be put up.

GOOD HOPE MINE.—*Dispatch*, Feb. 11th:—The principal shaft is 80 feet down, where the ledge is three feet wide, well defined, and increasing. The rock now prospects \$18 to \$20 per ton by mortar-crushing.

CALAVERAS COUNTY.

NEW MILL.—*Chronicle*, Feb. 11th:—Clark's quartz mill at Railroad Flats is completed. The battery of eight stamps is to be run by water power. One hundred tons of rock have been already hauled to the mill and a large quantity will be ready as soon as facilities for crushing are afforded.

GLENCOE.—Cor. of same:—The Glencoe Co. are opening a very large quartz lead. Mr. Garland, of Lower Rich Gelch, has made several prospects, at different depths and I have heard it estimated that forty dollars to the ton is the average. The shaft is down thirty feet. An extension of three thousand feet has been taken up, with some heavy names attached to it. The Sam. Braunan lead, a mile north-east, has been reopened, a tunnel having been run to the main lead. The Co. are timbering their tunnel for permanent work. Belding & Co., have sunk a shaft twenty feet deep, on the old Chapman ranch, in a very extensive lead, which prospects satisfactorily from the surface. They have taken out several tons of rock which they propose to crush at their mill at Railroad Flat.

EL DORADO COUNTY.

NINETY-THREE DOLLARS TO THE PAN.—Placerville *Democrat*, Feb. 11th: On Saturday a rich strike was made in the Cedar Spring Tunnel, on Cement Hill. The deposit is gravel and cement, and the spot so rich—ninety-three dollars to the pan—is 800 feet in the hill from the mouth of the tunnel.

THE QUARTZ HILL CLAIMS.—The mines on Quartz Hill, known as the Porphyry Claims, are doing well. It is rumored that the claim of S. Lemons is paying well. The lode is a part of the original Hodge & Co. lode. Our quartz interests are looking up. Considerable prospecting is going on.

SPANISH HILL.—The hydraulic claims of Varozza & Co., and the Blair brothers, are doing well.

ROBERSON.—This mine, owned by Sher-

wood, Roberson & Co., has now a 10-stamp mill, and improved machinery, and is successfully worked through a 100-foot shaft. Fifty car-loads are hoisted daily.

DAVIDSON MINE.—The *Folsom Telegraph* says: "We were shown a few days since some very rich specimens of rock from the Davidson claim at the depth of three hundred feet. This claim is on the same ledge with Pocahontas claim, which is paying largely. A mill is shortly to be erected on the Davidson also. This claim is six miles from Shingle Springs.

INYO COUNTY.

CERRO GORNO.—*Independent*, Feb. 4th: Judge Hannah writes us concerning the Buena Vista Tunnel and the Jefferson mine: "The tunnel is 536 feet in length, with 800 feet of track in tunnel and drifts, the whole costing \$7,000. About 100 feet apart in the side drifts of the tunnel are two cuts across the ledge, in one of which it proves to be from 40 to 50 feet wide, and in the other they have run 30 feet and are not yet through the metal. It is one solid mass of mineral. Within the past two weeks, in making these prospects, they have extracted 400 tons of ore." The same in speaking of the Jefferson ledge, says: "The shaft is down 150 feet, which has paid every foot from the roots of the grass to the bottom, the ledge being from 10 to 20 feet in width. The Buena Vista tunnel taps the ledge 300 feet below the surface. This ore will average from 50 to 70 per cent., while assays resulted in finding it to be worth from 100 to 125 ounces of silver per ton.

DEEP SPRING.—Cor. of same: The Blue Bird has a 60-foot tunnel; the ledge showing plain all the way. On the dump they have twelve or fifteen tons of ore, worth \$400 to \$500 per ton. The Cinderella is 6 to 8 feet thick, and has a 30-foot shaft. Hiskey and Walker of the Deep Spring M. & M. Co., are building a verberatory furnace.

MONO COUNTY.

BRIDGPORT.—Cor. of the *Record*: "Operations on the Dunderberg mine have been suspended until improved machinery for amalgamating can be erected at the mill. Mr. Nieder, the new amalgamater, having worked a few tons by the present apparatus, considers it very imperfect.

NEVADA COUNTY.

THE SEASON.—*Transcript*, Feb. 7th: The season, notwithstanding the discouraging beginning, is likely to prove better than the last. Up to Sunday night the rain fell, according to the gauge at the office of the South Yuba Canal Co., was 25.75 inches. Last year, up to the 9th of February, the total was only 25.55. The storms of the last few days, have enabled some miners, heretofore unable, to start up.

Same of 9th says the snows are deep in the mountains, and will be a source of water supply in the spring. With plenty of rain during the remainder of the season, the yield from hydraulic mining will be larger than for many years.

NORTH BLOOMFIELD.—Same of 10th: The Gravel Mining Co. are running 1,500 inches of water in their new ditch, and still prospecting in the channel at Malakoff. It is expected that the tunnel from Humbug creek to open this ground will be started next fall.

GOOD PROSPECT.—*Gazette*, Jan. 9th: The Filibuster Co., above Hennessee's, have connected the deep prospecting shaft on their gravel claims by a bed rock tunnel. Near the point of intersection they drifted out eight feet square on the bed rock, and obtained \$20 from the gravel.

EUREKA MINE.—*Grass Valley Union*, Feb. 6th: Yesterday was the regular melting day, and the proceeds of the last twelve days' run of the mill were put into three hars of beautiful gold, valued in round numbers at \$38,000. The last six days' run gave \$22,000 of the amount.

REGULARLY AT WORK.—Same of 8th: The Baltic Co., on Squirrel creek, have commenced gravel washing. The Co. have made arrangements to have a supply of water all the time.

PLACER COUNTY.

ST. PATRICK.—*Herald*, Feb. 11th: The shaft on this mine is the deepest in Placer County, south of Colfax, it being down over 200 feet. We are told by a former owner, that they have now a drift along the ledge at the 200-foot level twenty or thirty feet long which shows quartz for the whole length that will average \$100 per ton by mill.

GOOD PAY.—Fifty-two tons of quartz from the Buckeye mine was crushed at the Empire Mill last week which yielded \$1,800 in free gold, an average of about \$35 per ton.

AGAIN CRUSHING.—The Baltimore Quartz mill of Graves & Putnam has been again pounding away this week, and intended to

make a second clean up yesterday. The previous crushing was not entirely satisfactory, from the want of more perfect gold-saving attachments.

MONTANA.—We were informed by Mr. Lobner, from Colfax, that this Co. have their steam hoisting works completed, the shaft pumped dry, and are rapidly going down on the ledge. The shaft is down 86 feet. This is a ledge six feet wide.

IOWA HILL.—*Stars and Stripes* Feb. 9th: Readers may remember the rich gravel deposits in the Morning Star mine, and crevice, eighty feet deep, several feet in width and a hundred feet in length, which was astonishingly rich but caved in and filled up last summer. Since that time the debris has been cleared away and a side drift run for prospecting purposes. We are informed that last week this drift struck into a large body of very rich gravel, in which coarse gold is visible in every direction to a height of five or six feet from the bed rock.

PLUMAS COUNTY.

FROZEN UP.—*Quincy National*, Feb. 4th: A friend from the East Branch informs us that the miners are all idle waiting for "a thaw." The season has been the coldest known for many years. There is a large quantity of snow on the mountains however, and the boys anticipate a good run as soon as spring commences.

"ELIZABETHTOWN."—Blakesly, Braden & Co., are making their claim pay "big." We are informed that for five days this week, with two men they cleaned up twenty-five ounces. One sack, holding three paus of dirt, "panned out" about twelve ounces, some of the pieces weighing twenty dollars.

MINING.—*Chico Enterprise*, Feb. 11th: Henry Bidwell, the superintendent of the Union Mine, near Greenville, Plumas County, writes to his father that since his return home he has cleaned up over 200 ounces of amalgam, the result of work done in his absence, amounting to \$2,000, being an average of \$25 to the ton of rock crushed.

SHASTA COUNTY.

FLUME DOWN.—*Courier*, Feb. 4th: The rain storm, on the 27th ult., broke down the main flume on Ludwig's & Fochler's Piety Hill ditch. The damage cannot be repaired short of a thousand dollars. A number of miners who depend on this ditch for water, will be seriously inconvenienced.

SIERRA COUNTY.

ITEMS.—*Democrat*, Feb. 9th: The Pioneer Co. at Grass Flat, Northern Sierra, have got through the hard rock, and are getting along fast with their tunnel. The Smith Brothers are getting good prospects in Slug Cañon.

TULARE COUNTY.

The Visalia *Delta* of Feb. 8th says that a man by the name of Sawyer living on Wilcox cañon, a branch of Cottonwood creek, twenty miles North-east of Visalia took a notion to prospect for gold in the gulch near his house and as the result of three days' work, brought into town fifteen and a half pennyweights.

TRINITY COUNTY.

INDIAN CREEK.—*Journal*, Feb. 11th: Mr. Silcox is crushing at his mill on Indian Creek, two tons per day. He has made no clean up yet. The owners of the north extension of the Silcox & Smith ledge are prospecting for the vein. They have tunneled in one hundred and fifty feet.

GONE TO WORK.—Nichols & Hartham have gone to work on Keno Flat near Junction City, with flattering prospects.

Nevada.

ELY DISTRICT.

ITEMS.—*Record*, Feb. 9th:—The Washington, or No. 9 Co., are down on the main shaft 145 feet and are having it well timbered. The Raymond & Ely Co. is getting along swimmingly. The Burke is yielding its usual amount of ore, which is improving in quality, and keeps the 10-stamp mill at Bullionville at work. The Creole, helouging to the same Co. has arranged matters with the parties who had contracts on the ledge, and are now preparing to work it themselves. The Gen. Washington has been shipping considerable ore to the Big Smoky mill at Hamilton, also to the Chicago mill now building at Bullionville.

We believe the owners have until the 1st of March to extract what they can, when the mine will pass into the hands of other parties. The Meadow Valley Co. are shipping on the average 50 tons of ore per day to their mill at Dry Valley, and their average shipment of bullion is \$50,000 per week. The contract on the Washington, taken by Daly and Doody, will expire with the rest. A rich pay streak has been struck on the ledge, which by the time the contract expires will pay the parties hand-

somely for their labor. The Juniper claim, owned by Church & Co., has struck another vein of rich ore. The Bowery owners keep steadily at work taking out pay ore of the best in the district.

BULLION.—Same of 5th:—The shipments of the Meadow Valley Co. for the week ending 3d inst., amount to \$41,718.13. The amount shipped by the Raymond & Ely Co. during the week ending 6th, \$2,4000. Shipped by Phillips, \$1,472.57; by Courtney, \$1881.11. Courtney, Flood and Co. shipped 6 bars valued at \$11,913, making total for the week, \$80,564.81.

EUREKA DISTRICT.

TAYLOR'S SILVER WEST.—*Sentinel*, Feb. 11th:—This furnace has been running for the last week to the satisfaction of the owners. The capacity is four tons of bullion per day, and the arrangements are as perfect as the work could be made. The ore to be worked will be from Taylor's own mine, the Silver West, and he has made arrangements with the owners of the Bullwhacker to smelt three thousand tons for them.

FURNACES.—This place needs 20 additional furnaces. There are many mines here that will produce ore that will make \$300 bullion, that are not worked because the ore cannot be sold.

RICH BULLION.—We believe that the richest bullion ever smelted in Nevada was made by Ogden, Dunne & Co. For the whole week they were making bullion that would exceed \$500 in value, and on Friday and Saturday, they made three tons that assayed \$1,231 per ton.

HUMBOLDT.

The *Silver State* of Feb. 11th says the Pioneer Mill is now running again on Inskip ore.

RYE PATCH.—Cor. of same:—The day has come when low grade ores of \$40 and \$50 per ton can be made to pay by the Akin process. The mill at Rye Patch, running five stamps crushes 7½ tons of ore per day.

REESE RIVER.

BULLION FROM MONTEZUMA.—*Reveille*, Feb. 10:—Ten hars of the value of \$6,000, brought to town day before yesterday, were the product of the new mill of McGlew, Dawley & Co. The mill has been running one month, during which it has produced silver to the amount of \$20,000.

WASHOE.

OPHIR.—*Enterprise*, Feb. 12th:—The "uprise"—a steep upward incline—has now reached the height of 190 feet above the drift from which it started. A heavy body of clay has been struck, and quartz is looked for soon.

CROWN POINT.—The raise from the 1,100-foot level looks well. The whole face is in good ore. It has reached 135 feet above the track floor. The south drift from the 1,000-foot level is progressing favorably. It is yet 60 feet north of the raise from the 1,100-foot level. The connection between the two will be made in about two weeks. The bullion yield of the mine for January was \$32,000.

YELLOW JACKET.—*Gold Hill News*, 11th:—The mine is yielding 130 tons a day, from the 800, 900, and 1,000-foot levels. Average assay from car samples, \$61. The 1,000 and 1,100 foot level drifts are still progressing at a good rate, northward, although slower than if there was a circulation of cool air.

SAVAGE.—The daily product is 125 tons from the third and fifth levels of the old mine and the second, eighth and ninth levels of the new mine. A great amount of prospecting is being done.

HALE AND NORCROSS.—The yield 225 tons per day, 200 of which is from the eighth level—the lowest depth yet obtained in the mine. Within the last two days an excellent body of ore has been cut on the lowest level 100 feet south of the shaft, in a portion of the mine heretofore considered barren.

IMPERIAL-EMPIRE.—In this they are still sinking main shaft for a new level at 1,400 feet. A prospecting drift for the Holmes mine is in 240 feet. The old upper levels of the Imperial are yielding sixty tons per day.

VIRGINIA CONSOLIDATED.—They are still pushing the northwest drift in the direction of the old Central mine.

SIERRA NEVADA.—The mine is yielding the usual ore. The mill is running constantly upon the ore. Sacramento and Meredith mill started up on it day before yesterday. The affairs are most encouraging.

HOPE.—The Hope mine and mill, Silver City, was shut down day before yesterday. The company is badly involved in debt in every direction as well as to the workmen.

CHOLLAR-POTOSI.—The Chollar-Potosi continues its most excellent yield, the Belvi-

dere section holding out splendidly. The January receipts were \$276,606.65.

OVERMAN.—The Co. are now taking out sixty tons per day, principally from the 226-foot level.

SEGREGATED BELCHER.—Little will be done until after the starting up of their mill on the river, as their ore dump is full.

DANEY. The drift from the engine shaft was yesterday in 63 feet. The rock continues quite hard.

GOULD AND CUNNY.—The daily yield continues as usual. The January receipts were \$17,014.24.

Arizona.

BRADSHAW.—Prescott *Miner*, Feb. 4th: Recent discoveries of rich and extensive silver mines in this District have greatly excited our community, and the result is a great rush to that locality. Dud Moreland and others returned last week, with five hundred pounds of the ore. As high as fifteen hundred ounces of silver, per ton of rock, were obtained, and the lowest assay exceeded eight hundred. The principal mine—the "Tiger"—is a well defined lode, cropping out continuously for nearly three miles, and in places where the ledge can be fairly seen, showing a width of six feet.

ITEMS.—In Hassavampa district, the placer mines are yielding handsomely. Some work is being done on the Davis lode. From Lynx creek we learn that parties are working on an extension of the Vernon. It is rumored that several extensive purchases of mines, in various portions of the Territory, have been recently made, chiefly by English Capitalists.

Colorado.

JIM CREEK.—Boulder *News*, Feb. 1st:—S. T. Turbleson is at work on the Christie and Yankee Blado lodes. Willard & Co., are down 35 feet, with a four foot crevice. Jesse Ora and Joe McPherson, are working the Mammoth lode for Pratt & Co. They have commenced a fifty foot shaft. Keen & Stanley on the Nodaway lode, have a four foot crevice.

GOLD.—Hiram Fullen's lode at the head of Akin's gulch, in Gold Hill District, yields under stamps from 10 to 12 oz. of gold to the cord, and has a four foot crevice.

ITEMS.—Central City *Register*, Feb. 8th: Mr. Martin treated 800 pounds of ore from the "Devil's Grip" lode in his pans and got over five ounces of gold. Root, Hall & Queen, yesterday struck some very rich gravel in their drain drift. Several pans full washed down at the rate of fifty cents to the pan. A later notice says the streak is likely to be permanent. At present it is paying an ounce of gold to every foot in length of the drain which is five feet in width. Two nuggets were taken out yesterday, one weighing 21 dwts. and the other 28.

GOLD SHIPMENTS.—The shipment yesterday, by J. Chaffee & Co., amounted to \$15,000 in currency. The R. M. National Bank shipped Monday, \$4,000. This week's shipments amount to \$34,000.

CARBON MINE.—Cor. of same:—Up to Jan. 1st, this mine yielded 450 tons of shipping ore, worth \$76,989, or \$171 per ton, nearly. This is good; but the real value of this mine consists, not in its rich ore but in its large amount of low grade. There are on hand 500 tons of fourth-class ore. Then the dump piles contain a considerable amount, as none of this class was saved till this season. By careful measurement, there are exposed 34,440 cubic feet of ground yet in the mine above the 2d level ready for stopping at any time without further expense. And from this level to the bottom of the shaft, there are 32,795 cubic feet. This total of 67,235 cubic feet at the usual estimate of 11 solid cubic feet to the ton, amounts to over 6000 tons. This 6,500 tons at \$20, over all expenses,—estimated from carefully averaged assays,—makes with the 450 tons already sold, the production and promise to date, \$207,000.

GEORGETOWN ITEMS.—*Miner*, Feb. 9th: Since our last the Stewart has shipped silver bullion to the value of \$4,739.90, coin. Last week the Brown shipped a "but-ton" weighing 611 lbs. Troy, valued at \$9,530 coin. The shaft on the Napoleon lode has reached a depth of 199 feet, and the tunnel to intersect it a distance into the mountain of 166 feet. Since our last report the German Reduction Works have shipped four bars of bullion. These aggregate in value \$1,616.49, coin. We have been shown the returns from 2,352 lbs. of ore from the Pelican lode. The price per ton paid was \$279.60, and the total net return \$468.60.

QUAKEN LODGE.—While drifting was going on, 6 1/4 tons ore gave, at the works of Hupeden & Co., \$568 coin. The net profit was \$200 over and above all costs.

CASCADE DISTRICT.—Capt. Griswold, on

the Bald Eagle lode, has a 15-inch pay vein. Assays as high as \$10,000 per ton have been obtained. Adams & Co. in the Ella Kimball, have a 30-foot shaft, and an 80-foot tunnel. The 1st. class ore runs 450 ounces per ton. J. G. Thorn employs one man on the Alps lode, who takes out, with Giant powder, one ton per day of ore worth \$200.

LAKE COUNTY.—The Pilot, one of the free gold lodes, has recently produced some very rich pay dirt, one pan of which yielded 57 ounces of gold. The Printer Boy lode, without affording much dirt so rich as that, is perhaps the better lode, as all the crevice material contains more or less gold. The ore from these lodes is easily treated, being "puddled" and the resulting gold cleaned up from the puddling boxes.

THE CLIFT MINE.—A rich body of ore, one foot in breadth, consisting of royal pay and rock coated with native silver, has been uncovered in the mine where the walls are well defined and stand about six feet apart.

Idaho.

THE BASIN.—The Idaho City *World* says: We have had several severe though welcome snow storms. About a foot, in the aggregate, has fallen during the past five days, and we learn that at Summit Flat and near the head of Elk creek the snow is 8 1/2 feet in depth. A few more such storms will provide us with sufficient snow to warrant a lively mining season.

OWHYEE BULLION.—*Aralanche*, Feb. 4th: Wells, Fargo & Co. shipped from here this week 17 bars of bullion, valued at \$37,239.50, making the total for the month ending to-day, \$166,185.50.

SNAKE RIVER.—*Democrat*, Feb. 4th: Messrs. Moore, Silvy, Lewis and Johnson, started on Thursday for Snake river. Many parties are leaving for those mines, and the indications are that much work will be done during the coming season.

Montana.

QUARTZ.—*Helena Gazette*, Feb. 5:—We were informed yesterday that silver quartz had been struck at Jefferson which turned out \$1,500 per ton in the furnace.

PHILLIPSBURG.—Cor. of same:—The mill works all the quartz from the Hope without assorting. A claim in the new mines, on Rock Creek, changed hands yesterday for \$300 cash. The Cable mill is paying well, we are told. We learn that this wonderful mine is looking better than ever. The two tunnel companies, the Miners' and Mechanics', and the Cameron, are pushing their shafts as rapidly as possible.

The Deer Lodge Independent of Feb. 4th says a large force is working in the Cable mine. A drift for draining the lode is to be run at once. The tunnel is in 500 feet. The Mechanics' tunnel is in 900 feet.

ITEMS.—*Missoula Pioneer*, Feb. 2d: Miners on Spring Bar, Quartz Creek, have struck 50 cents to the pan, and the bed-rock is still pitching into a supposed back channel. Miller, O'Brien & Co., on Nos. 32 and 33 in the gulch, are 31 feet down. They expect to reach bed-rock in about 5 feet more. In these claims gold has been got from the grass roots down. Other companies will commence work as soon as spring opens.

FOREST CITY.—Cor. of same:—An undivided one-sixth interest in the five claims from 67 to 71, inclusive, was sold a few since for \$3,500.

New Mexico.

LA MESILLA.—Cor. of Santa Fé *Post*, Feb. 4th: Prof. Low is at Silver City assaying with astonishing results from *La Providencia* mines; scarcely an assay goes below \$1,600 to the ton. It is reported that the Harpending Co. will commence operations at Ralston within a month; also that there is a big mill on the way from St. Louis to Silver City. Carson's mill will be on the ground by the 1st of May.

Oregon.

EAGLE CREEK DITCH.—The Baker County *Democrat* says that C. M. Foster, U. S. Surveyor of mining lands in Eastern Oregon, has staked out sixteen miles of the main line of the ditch. It will be twenty-two miles in length, and run three thousand inches of water in the Shanghai, Rooster and Powder river slope mining districts. Work will be commenced as early as April.

QUICKSILVER MINING GRANT.—Letters patent of the United States to the X. L. C. R. Mining Company, more commonly known as the Redington Quicksilver Mining Company, have been received at the Land Office in this city. The deed conveys lot 37 of township 11 W., range 4 E., and embraces 4,200 linear feet in the quicksilver mining district of Lake county.—*Marystville Appeal*.

Mining Stocks.

SAN FRANCISCO, Thursday Eve., Feb. 16.

The Mining Share Market has been quite irregular the past week, the fluctuations in several prominent descriptions being considerable. On the 10th, the following incorporations paid their monthly dividends: Chollar-Potosi, \$140,000; Golden Chariot, \$60,000; Hale & Norcross, \$40,000; Meadow Valley, \$60,000; North Star, \$9,000; Yellow Jacket, \$48,000. The Chollar-Potosi paid an extra dividend of \$5 per share on the 15th. The Eureka Consolidated have declared their first dividend, \$1 per share, payable on the 20th.

The following table gives last Thursday's quotations compared with to-day's, and the highest and lowest points reached by the several descriptions of stock.

METEOROLOGICAL OBSERVATIONS

AT SACRAMENTO, CAL., BY THOS. M. LOGAN, M. D.

Permanent Secretary of State Board of Health.

Lat. 38° 31' 41" N., Long. 121° 29' 44" W. Height of Levee above mean low tide, at San Francisco, 74 feet. Height of lowest surface of mercury, 34 feet. The amount of cloudiness is designated by figures, 10 being entire cloudiness; 5, half cloudiness; 0, entire clearness; and intermediate numbers in proportion. The force of the wind is also registered in the same manner; 4 being a calm, 1 a very light breeze, and 10 a hurricane. The means are derived from three daily readings at A. M., 2 P. M., and 9 P. M., in uniformity with the arrangements of the Smithsonian Institution.

*Thermometer at Rain.

REMARKS.—Cloudy and foggy weather has prevailed more or less during the entire week, which, with the absence of strong northerly winds, has secured the full benefit, for the growing crops, of the light rains that have fallen.

The rain-fall of the week sums up 0.411 inches, to fall the thousandth of an inch more from fog and mist on the 9th, must be added—making the total for the season, up to date, exactly 4 inches.

PHOTOGRAPHY.—For CABINET PHOTOGRAPHS, or Enamelled Cards, of the very best quality, you must go to the NEW YORK GALLERY, Nos. 25 and 27 Third street, San Francisco. Every picture warranted to give satisfaction.

BLOCK TIN AND SOLDER WIRE, broom wire, piano covering wire, etc., manufactured by Joshua Gray, 473 Broadway street.

THOMAS O'NEIL, Ornamental Glass Cutter, No. 10 Steventon street, up stairs. Stained, Ground and Ornamental Cut Glass to order on reasonable terms. 14y20

CONTINENTAL Life Insurance Co., 302 Montgomery street, corner of Pine.

FENCING THE TRACK.—The California Pacific Railroad Company is now engaged in fencing in the whole line of their track: the occasion of the work being the recent decision of the Supreme Court, holding railroad companies responsible for damages done to cattle killed upon any track not fenced in.

The Young of Oysters.

EDITORS PRESS:—I noticed in one of your late numbers that you assert that by opening an oyster and examining the liquor retained in the shell with a microscope, you can see many small oysters, covered with shells, swimming nimbly about. Well, you please inform your careful readers how they get there, and when they are set free by their mothers to take care of themselves; and if there are male and female oysters; if so, how do they multiply. This is a very interesting subject, and one but little understood. J. B.

San Francisco, Jan., 1871.

The oyster was formerly considered hermaphrodite; but it is now known that it is of separate sexes—the females largely predominating in numbers. They are ovoviviparous—they produce a living fetus, by excluding it from an egg covering. The eggs are expelled in a white, viscid fluid, called "spats" (common to all shell fish). This substance adheres to marine bodies and to the parent shells; by thus accumulating one upon another, immense banks of oyster beds are sometimes formed.

As the fish are all stationary, fecundation is effected through the medium of the water, which conveys the sperm to the ova. The eggs, as already intimated, are to a certain extent developed before being ejected by the female; and sometimes, after being ejected, instead of becoming fixed to the outside of the shell, or to some other neighboring body, they continue to float about until they are accidentally received within the cavity of the shell of the adult oyster, in the process of respiration. Here they often continue until developed, as described in the paragraph to which our correspondent refers.

There is a species of small crab that often finds its way within the shell of the oyster in the same manner. Neither the young oyster nor the crab can form any portion of the food of the adult oyster, as the softness of the mouth of the latter does not admit of its attacking any resisting substance, alive or dead. When the crab or young oyster becomes large enough to annoy the adult oyster, it is summarily ejected. The young oyster is attached to its bed first by the glutinous nature of the fluid in which its partially developed ovals enveloped; and when once fixed, a calcareous growth from the shell itself, perfects and permanently fixes the union.

A NOVEL WAY TO ALLAY HUNGER.—It is said that the hunters of Siberia, when hard pressed by hunger, take two thin pieces of board, and placing one on the pit of the stomach and the other on the back, gradually draw together the extremities, and thus allay, in some degree, the cravings of appetite. A similar practice is known among the South Sea Islanders. This is supposed to be a very economical kind of board.

PHOTOGRAPHS WANTED.—The publishers of the SCIENTIFIC PRESS and of the RURAL PRESS, being desirous of retaining more accurately in their memory the lineaments of their correspondents to whose interesting articles they feel deeply indebted, propose instituting a "Correspondents' Gallery," and therefore would be most pleased to receive the photographs of any and all of those who communicate with the papers. It is not proposed to "publish" these photographs at present, but it will be most pleasant to have the faces where they can be looked at, and where any reader or writer, on calling at the office, may have an introduction to those with whose ideas he or she has become acquainted. Will our many kind friends oblige us in this matter?

THE CHANGE OF COLOR IN LEAVES.—The Athenæum says: "Experiment has confirmed the conclusion that leaves turn red, at the end of the season, through the action of an acid, since one of the elements producing the green color must be a vegetable blue. Autumnal leaves, placed under a receiver, with the vapor of ammonia, in nearly every instance lost the red color, and renewed their green. In some, such as blackberry and maple, the change was rapid, and could be watched by the eye; while others, particularly certain oaks, turned gradually brown, without showing any appearance of green."

An Improved Flour Mill.

In our great wheat-producing state, any device which has to do with the production or treatment of this important staple is of interest. There is a gentleman, who thinks that he has an invention which will be particularly valuable to our farmers, as well as to others who need grinding machinery. An illustration of this invention is here given. It is called the "Iron-Clad" mill, and is constructed with a view to simplicity and efficiency. It has comparatively few pieces, small weight and great strength; and is said to grind better and faster than the common kinds.

As to its work, we give one example. We have a letter from Mr. M. A. Gee, of the North-Western Flour mills, at Milwaukee, and this we publish with a few unimportant alterations. The gentleman writes:

After a trial of four months, notwithstanding my strong prejudice at the beginning, I am delighted with the Iron Clad. We tested it by running it by the side of a very choice 4-foot buhr, both on the same wheat. We would try first the one and then the other. The facts are simply

let them down, and when run out, shut up the spout and let the mill run empty for hours, don't meddle with the lighterscrew, and yet get no dull stone. I consider this remarkable. Again, the motion being rapid, it bleaches out the middlings and makes them whiter than does any other stone I ever saw.

We shall be very glad to see any one who wishes to see the Iron Clad in operation, and will take pleasure in answering any questions in reference to it.

Mr. Geo. Littlefield, miller, witnesses to the correctness of these statements. The agent for the mill, who may be addressed for any further particulars, is Mr. J. A. Forsman, 70 South Canal street, Chicago.

California Sugar Making.

EDITORS PRESS:—The success of the Alvarado beet sugar works in placing upon the market an excellent grade of white, granulated sugar, at a cost that successfully competes with the sugars of the refiners, very naturally tends to awaken a lively interest as to the future of this great industry—Whether the five millions of dollars that are now paid annually for sugars to

the enterprise is sure to succeed, and then a better expenditure of the money can be made in using the \$20,000, in a whole and perfect apparatus from the start, than in the use of the half first, and then adding the other half to the inadequate machinery of the first year.

What the country wants, is a way by which the small farmer, with his own melon patch, can make all the sugar he consumes, if only brown sugar, and have a surplus to dispose of.

These brown sugars could be collected by the refiners and converted into the best white sugars. Then all interests would be subserved, and a new and exceedingly profitable industry introduced, that would soon tell upon the prosperity and wealth of the state.

Farmers can even make their brown sugars from melons at an expenditure of \$1,000 or less for equipment; but they must know how to make it; how to obtain the juice free from the rind and pulp; how to defecate the juice by the use of lime; and then how to take the lime from the concentrated juice, without the use of costly apparatus for carbonic acid, necessary in beet sugar making by the Alvarado process.

A melon sugar establishment upon some of our reclaimed lands, as, for instance, Sherman Island, at a cost of \$20,000, would not only demonstrate the complete practicability of an extension of similar enterprises all along the alluviums of our valleys; but would also pay two and a half per cent. per month upon the entire cost, including land, the first year, and better than that in years following.

I am ready to put money and my whole time into an enterprise of this kind, should there be others who will unite with me:—First, to promote our own pecuniary interests, and then, indirectly, the prosperity of the whole state.

I would have it a model sugary; a sugary of interest and instruction to all desirous of extending successfully this new and important industry. W. WADSWORTH.

Sacramento, Feb. 1870.

A GOPHER HOLE.—A gopher burrowed his way through the massive embankment of the new reservoir of the San Jose Water Company, and as a consequence the water commenced to find its way through the hole. The leak was discovered and the gopher killed, but he had already done his work. The great pressure of the water in the reservoir soon enlarged the small aperture to the size of a man's body, and the reservoir was soon emptied and all the land below it flooded. Several weeks time will be required to make repairs and fill up the "gopher hole." In the mean time, however, the city will receive its regular supply of water from the reservoir.

VEGETABLE PROFITS IN MASSACHUSETTS.—A correspondent of the Boston Cultivator reports his success in raising vegetables, four miles from a village. The two requisites adhered to were good soil and thorough cultivation. The entire grounds were a few acres, and a small part was occupied. —Half an acre of peas gave seventy-eight bushels (in pod of course) at \$1.90 per bushel, or \$148.20. Sweet corn amounted to \$70 from half an acre. Two hundred hills of pole beans gave \$50. Over \$300 were received in less than three months.

AMERICAN MECHANICS may feel a bit proud over the fact that some of our gun manufactures are now filling large orders for Russia, and that fifty Yankee mechanics have just departed for that country to take charge of government shops. England also sends over heavy orders for the Gatling gun, and Prussia and France are drawing constantly on the inventive genius of our craftsmen.—Sac. Bee.

CHEESE IN NEW YORK.—Cheese manufacture in New York State is growing to stupendous proportions; 1,200 factories are already in operation.

CENTRAL CITY, Colorado, is taking measures for a water-supply. It is estimated that an adequate supply can be obtained at an expense of about \$3,000.

FORSMAN'S "IRON CLAD" FLOURING MILL.

these: We can flour in the 4-foot buhr 15 bushels of No. 1 spring wheat per hour; with the Iron Clad we can flour 20 bushels of the same. This is with a full head of water. When the water gets so low that we cannot run the 4-foot stone, we can take it off, throw on the 30-inch Iron Clad, and run all day and night, making 1 bbl. of flour per hour; and the flour seems to be just as good as when running full head.

We have taken samples of flour to our regular Chamber of Commerce Flour Inspectors from both the 4-foot and the Iron Clad, and in every case the choice has been that of the latter. Not to stop here, we have taken the flour to the Board of Arbitrators appointed by the Chamber for their decision, with the same result. And as a still further test, we have had the flour from each stone baked by some of our most experienced bakers, and the Iron Clad is still ahead.

From 3 to 7½ lbs. less wheat are required to the barrel of flour with the Iron Clad, than with the 4-foot stone. This is a very important item, as every man accustomed to running a flour mill will readily see.

These experiments have not been made in a hasty manner, but the facts given are the results of very careful and very fair tests, giving the 4-foot stone all the opportunity possible. Again, it has not been for a day or a week, but right along every day.

To keep the Iron Clad in order does not require one-half the attention which is necessary with the ordinary mill. It runs equally well when grinding 5 bushels and when grinding 20 bushels per hour; this is not the case with any other mill I ever knew. In regard to grinding middlings it cannot be beat in the U. S. When we get ahead on middlings, we open the spout and

supply our wants, shall continue to flow away from us, to foreign countries; or whether within three years from this, California will be the producer of all she consumes and a large supply for a vast country east of the Sierras.

The works at Alvarado conclusively show that with the use of a large capital, ranging from \$100,000 to \$200,000, white sugar, equal to the best of the refiners' goods, is made and sold at a large profit. But the large capital required to make sugar upon this plan, entirely precludes the possibility of sugar making becoming that general industry that it would, if it could be prosecuted upon a capital within the scope of the small farmer's means, or an association of a few for that purpose.

One great item of cost in operating a beet sugary, is the transportation of the beets from the fields where grown, unless in close proximity to the sugary. Companies should always own land to the extent of six hundred or a thousand acres, in the immediate vicinity of their sugary. This almost necessarily involves the use of large capital to operate beet sugaries successfully.

It is not so with sugar from melons. An establishment for melon-sugar making need not cost more than \$10,000; but if it is proposed to enlarge the works after the first year, provided it proves a success, it would be far better that the original first investment be \$20,000; because, in the first place,

HOUSEHOLD READING.

A Few Hints About Cooking Game.

The following hints about cooking game-birds is taken substantially from *Hearth and Home*: The cooking of game is extremely simple, as very few kinds require a force-meat; stuffing and the sauce is easily made. The longer game is kept, provided it is not stale, the better—and it is better kept in the feathers and skins until just before cooking. When the feathers come off easily, the birds may be considered ripe for the spit or oven. Be very careful not to tear the skin while taking off the feathers. After removing the feathers, pass the blaze of a lighted white paper over the outside surface to singe off the hairs, which, if allowed to remain, would show very distinctly after the birds are roasted. Be careful in drawing the birds, and they will require very little washing. The less they are washed the better flavor they will be.

Do not soak game in salt and water, as recommended by some. They say, "It is to take out the game flavor." If the game flavor is undesirable, soaking in salt and water would not remove it. But the game flavor is just what epicures like. The heads of the birds, with the neck, should be cleaned, the eyes removed, etc., and skewered to the side of the wing and roasted with the game. This process distinguishes the bird from domestic fowls when it comes to the table. No stuffing is required. Sometimes wild ducks may have a mild force meat of bread crumbs soaked in port wine; but it is not usual. Put no water in the pan, but baste the birds every few minutes with butter and the gravy that runs from them. Woodcock or snipe are prepared for the roast without drawing or opening them in any way. The head, with the long bill is cleaned and fastened to the wing, and the feet left on.

Bread crumbs fried to a fine brown in butter, are served with game; also bread sauce and jelly. The bread sauce may be made as follows: Take a quantity of fine white light bread crumbs. Pour over them an equal quantity of boiling new milk. Let it soak a while, then stir in a little butter and salt. If desired, you may add cayenne pepper or a little mace. Some add a boiled onion chopped fine. It is very good without these additions, and suits the general taste better. It should have a boil up, and be allowed to stand, where it will not burn, on the back of the stove till wanted for the table. Small birds are very nice rubbed over with the white of an egg and then rolled in bread crumbs before roasting. Baste with butter and apply fresh bread crumbs to bare places till they have a uniform appearance. Some nicely toasted slices of bread, soaked a minute or two in the gravy from the pan, is served with game, and is very much relished by some persons.

NATURAL HISTORY OF THE NOSE.—The nose, says an observant writer, acts like a custom-house officer to the system. It is highly sensitive as to the odor of the most poisonous substances. It readily detects hemlock, henbane, monkshood, and the plants containing prussic acid; it recognizes the smell of drains, and warns us not to smell of polluted air. The nose is so sensitive that air containing a 500,000th part of bromine vapor will instantly be detected by it; it will recognize the 27,000,000th part of a grain of otto of roses, or the 15,000,000th part of a grain of musk. It tells us in the morning that our bedrooms are impure, and catches the first fragrance of the morning air, and conveys to us the invitation of the flowers to go forth into the fields and inhale their sweet breath.

SAVE A LITTLE.—Every man who is obliged to work for his living should make it a point to lay up a little money for the "rainy day," which we are all liable to encounter when least expected. The best way to do this is to open an account with a savings bank. Accumulated money is always safe, it is always ready for use when needed. Scrape together five dollars, make your deposit, receive your bank book, and then resolve to deposit a given sum, small though it be, once a week; according to circumstances. Nobody knows, without trying it, how easy a thing it is to save money when an account with the bank has been opened. With an account a man feels a desire to enlarge his deposit. It gives him lessons in frugality and economy, weans him from his habits of extravagance, and is the very best guard in the world against intemperance, dissipation and vice.

FRYING MEAT AND POTATOES.

None of the rapid processes of cooking is so generally abused as frying. The frying-pan has awful sins to answer for. What untold horrors of dyspepsia have arisen from its smoky depths, like ghosts from witches' cauldrons! The frizzle of frying meat is a warning knell on many an ear, saying, "Touch not, taste not, if you would not burn and writher!" There are two ways of frying employed by the French cook. One is to immerse the article to be cooked in boiling fat—emphasis on the word *boiling*—and the philosophical principle is so completely to crisp every pore, at the first moment or two of immersion, as effectually to seal the interior against the intrusion of greasy particles; it can then remain as long as may be necessary to thoroughly cook it, without imbibing any more of the boiling fluid than if it were enclosed in an egg-shell. The other method is to rub a perfectly smooth iron surface with just enough of some oily substance to prevent the meat from adhering, and cook it with a quick heat, as cakes are baked on a griddle. In both the cases, there must be the most rapid application of heat that can be made without burning, and by the adroitness shown in working out this problem, the skill of the cook is tested. Any one whose cook attains this important secret, will find such fried things quite as digestible, and often more palatable than others.

How Prof. Blot Fries Potatoes.

When Prof. Blot was in his glory at Saratoga, potatoes, fried under his supervision, were considered so delicious and unsurpassed for delicacy that they were sold in small great hotels, precisely the same as sweet parcels, and purchased by visitors from the meats, at a confectioner's. The frying was done, as suggested above, the potatoes being cut in thin slices, every piece of a uniform size and thickness. So perfectly were they cooked that they scarcely greased the delicate white paper in which they were put up! This hint of uniformity in size should also be observed in boiling the vegetable; select for any given boiling, potatoes of a uniform size.

Curing Meat.

To one gallon of water, add one and a half pounds of salt, half a pound of sugar, half an ounce of saltpeter, half an ounce of potash. In this ratio the pickle to be increased to any quantity desired. Let these be boiled together until all the dirt from the sugar rises to the top and is skimmed off. Then throw it into a tub to cool, and when cold, pour it over your beef or pork, to remain the usual time, say four or five weeks. The meat must be well covered with pickle, and should not be put down for at least two days after killing, during which time it should be slightly sprinkled with powdered saltpeter, which removes all the surface blood, etc., leaving the meat fresh and clean. Some omit boiling the pickle, and find it to answer well; though the operation of boiling purifies the pickle by throwing off the dirt always to be found in salt and sugar.

The Germantown *Telegraph*, good authority, says if this receipt is properly tried it will never be abandoned.

How to Jerk Beef.

Slice pieces from the round, or fleshy part, about two inches thick. If the operation is to be performed in a moist atmosphere it will be necessary to hang the pieces over a slow fire which is not permitted to blaze, so that the process may be aided by both heat and smoke. A scaffold may be constructed, the covering of which should consist of small poles or sticks, upon which the meat should be spread and frequently turned, and beneath which the fire should be placed. It is better in such a treatment to first dip the slices in very salt water.

In California and some other places, where the air is very dry, (during the dry season) meat may be jerked or dried by simply exposing it to the air and sun without salt. Fat meat of any kind cannot, however, be cured in this manner; as the chemical changes which make fat rancid are quite different from those that render red meat or muscle unfit for use. Salt, freely used, is the only agent that will preserve fat and keep it in good condition for food. In cooking jerked beef it should first be soaked about half an hour in warm water—according to hardness and dryness.

DR. J. V. C. SMITH tells the Farmers' Club of New York that much of the vinegar usually sold, is sulphuric acid, and that its use is the cause of the decay of the teeth.

Domestic Receipts.

How to Cook Old Fowls.—For the possible benefit of some of our young housekeepers, we will tell them how to cook an old chicken:—Prepare as for roasting, then boil three hours in a covered pot, with one quart of water, to which add two tablespoonfuls of vinegar; after which put in a pan, in a hot oven, for about one hour, to brown. The liquor in the pot to be prepared for gravy; should the water boil away to much, more should be added. The result is, the meat is as tender as young chicken, and some think richer and better.

To Make Leaven.—Stir corn meal in a pint of fresh buttermilk; add an old yeast cake dissolved in water; make it about the consistence of batter bread, and set in a warm place to rise. When well risen, add more meal, make it into cakes, and dry in the shade.

To Wash Black Calico Without Fading.—Put it to soak in weak suds made boiling hot; let it stand until cool enough to handle, then wash and rinse in the usual way. For stiffening, use strong coffee or old skim-milk.

How to Choose a Black Silk.—Pull out a thread of the filling and see if it is strong. If it stands the test, then rub one corner of the silk in the hands as though washing it. If on holding it up to the light, and looking through it, you see no traces of the rubbing, be sure the silk is good. The warp and filling should not differ much in size, or it will not wear well. If you choose a figured silk let the figure be small and well woven in, else it will soon present a frayed appearance, and you will have to pick off the little lags of silk that will dot the breadths. Reps silk wears about as long and well as any other kind. It does not wrinkle easily, and looks about as well after being dyed as before.

To Iron Velvet Ribbon.—Dampen the under-side slightly, and draw it backward and forward over a hot stove-pipe until the velvet is quite dry. A still better plan—though in winter it is not always as convenient—is to lay a wet piece of cotton-cloth on a hot flat-iron placed upside-down, and while the steam is rising from it, to draw the under-side of the velvet tightly backward and forward over the wet cloth.

Mechanical Hints.

BLACKING FOR HARNESS.—A good blacking is made of 4 ounces of hog's lard, 16 ounces neatfoot oil, 4 ounces yellow wax, 20 ounces ivory black, 16 ounces brown sugar, and 16 of water. Heat the whole to boiling, and stir it till it becomes cool enough to handle, then roll it into balls about two inches in diameter.

ANOTHER.—A cheap and good blacking can be made as follows:—Soften two pounds of glue in one pint of water, dissolve two pounds of soap (castile is the best), in one part of warm water; after the glue has become thoroughly soaked, cook it in a glue kettle, and then turn it into a large pot, place the pot over a hot fire and pour in the soap water, slowly stirring until it is well mixed; then add a half-pound of yellow wax cut in slices. Let the mass boil until the wax becomes melted, then add half a pint of neatfoot oil and a sufficient quantity of lamp black to give it color; let it boil a few minutes, and it will be fit for use.

FRENCH POLISH.—When a harness becomes soiled its beauty can be restored by the use of French polish, which is made as follows:—Take 4½ pounds stearine, 6½ pounds of turpentine, and 3 ounces of coloring or ivory black. Beat the stearine out to thin sheets with a mallet, then mix it with the turpentine, and subject it to a water bath. While heating it must be stirred continually; the coloring matter is to be thrown in after the mass has become thoroughly heated. It is thrown into another pot and stirred until it is cool and thick; if not stirred, the mass will crystallize and the parts become separated. When used, it must be warmed, and a small quantity rubbed on the leather with a cloth; use but little at a time and put on very thin. After it has partially dried, rub with a silk cloth, and a good polish will be produced.

WASH FOR CLEANSING SILVER AND BRITANNIA WARE.—Take one pound of common hard soap, three table spoonful of sp. of turpentine and half a tumbler of water. Allow the soap to dissolve; then boil ten minutes, and before it cools add six table spoonful of sp. of hartshorn. Make a suds of this preparation and wash the silver with it.

Life Thoughts.

It is undoubtedly a duty to require riches, not for the condition which they make, but for the power they confer. The wisdom, however, properly to employ them demands even more earnest study and honest endeavor.—*Simms*.

A WISE MAN has found a remedy for unhappy marriages. It is to abolish the institution of marriages entirely.

A GOOD conscience is some times sold for money, but never brought with it.

MORE flies are caught with a drop of honey than a hogshhead of vinegar.

A MAN had better be poisoned in his blood than in his principles.

DEATH has nothing terrible in it but what life has made so.

The glory of a people and of an age is always the work of a small number of great men, and disappears with them.

SOME often repent, yet never reform; they resemble a man traveling a dangerous path, who frequently starts and stops, but never turns back.

FIGHT hard against a hasty temper. Anger will come, but resist it stontly. A spark may set a house on fire. A fit of passion may give you cause to mourn all the days of your life.

Do daily and hourly your duty; do it patiently and thoroughly. Do it as it presents itself; do it at the moment, and let it be its own reward. Never mind whether it is known or acknowledged or not; but do not fail to do it.

If you are a wise man, you may treat the world as the moon treats it—show only one side of yourself; seldom show yourself to much at a time, and let what you show be calm, cool and polished; but look at every side of the world.

EVERY lady who educates her servants into greater truthfulness, fidelity and orderly ways of life, is doing missionary work of the best kind.

"BY FITS AND STARTS."—Spasmodic efforts amount to little or nothing. It is steady application that accomplishes. One may be easily "fired up" to do something, and as suddenly cooled off. The team—of men or horses—that pull together, and pull steadily, will do the work. But those who are always beginning, and never finishing, have more of the spasmodic than of the persevering. Moral: Teach your children to do one thing at a time, and to finish what they begin.

WHAT A MAN KNOWS.

What a man can write out clearly, correctly and briefly, without book or reference of any kind, that he undoubtedly knows, what ever else he may be ignorant of. For knowledge that falls short of that—knowledge that is vague, hazy, indistinct, uncertain—I for one profess no respect at all. And I believe there never was a time or country where the influences of careful training were in that respect more needed. Men live in haste, write in haste,—I was going to say think in haste, only that the word thinking is hardly applicable to that large number who, for the most part, purchase their daily allowances of thought ready made. You find ten times more people now than ever before who can string words together with facility, and with a general idea of their meaning and are ready with a theory of some kind about matters. All that is very well so far as it goes, but it is one thing to do this and quite another to know how to use words as they should be used, or really to have thought out the subject which you wish to discuss.—*Lord Stanley*.

NEWSPAPER.—A man eats up a pound of sugar, and the pleasure he has enjoyed is ended; but the information he gets from a newspaper is treasured up in his mind, to be used whenever occasion or inclination calls for it. A newspaper is not the wisdom of a man or two men; it is the wisdom of the age—of past ages, too. A family without a newspaper is always half an age behind the times in general information besides, they never think much, nor find much to think about. And there are little ones growing up in ignorance, without a taste for reading. Besides all these evils, there's the wife who, when her work is done has to sit down with her hands in her lap, and has nothing to amuse her mind from the toils and cares of the domestic circle. Who would be without a newspaper?—*Franklin*.

The Ohio State Library has been presented with a deed 222 years old. It was made for the conveyance of land in Wales.

Gold and Legal Tender Rates.

San Francisco, Wednesday, Feb. 15, 1871.—Legal Tenders buying @90; selling @90½. Gold in New York to-day 111½.

Table of Contents.

Babcock's Fire Extinguisher, Ill; Arizona; Copper; State University.....	97
MECHANICAL PROGRESS.—Weight and Short Stroke for High Speed; Steel Tires; Chloral Hydrate in Photography; Projectiles; Iron Smelting; Utilizing Waste Heat; Peat; Tongh Iron.....	98
SCIENTIFIC PROGRESS.—Descent of Man; Tubercle Germs; Iridosmine; Glycerine Extract of Pepsin; Spontaneous Generation; Eclipse.....	98
Notes on Merced County; A Huge Manufacturing; Remarkable Body of Water.....	99
MINING SUMMARY; Mining Stock Market; Shareholders' Directory; Market Rates.....	100, 101
INDUSTRIAL MISCELLANY.—Young of Oysters; "Iron Clad" Flouring Mill, Ill; Cal. Sugar Making.....	102
HOUSEHOLD READING.—Cooking Game; Natural History of the Nose; Frying Meat and Potatoes; Domestic Receipts; Mechanical Hints, etc.....	103
Notes to Correspondents; Curious Gold-Quartz Crystal; Utilizing Nature's Stores of Energy; Hallidie's Improved Wire Rope-Way, Ill; Recent Patents.....	104, 105
Vaporization and Elastic Force of Steam, Ill; Ice-Boats and Fast Trains; Lowest Type of Humanity.....	108
Bull Run District, Nev.; Banner District, Cal.; Engineering Projects; Rainy Season for Twenty-One Years; New Publications.....	109

Notices to Correspondents.

QUARTZ.—About the only way to "determine the weight of gold in quartz, without breaking up the quartz," would be to take the specific weight of the whole mass and then calculate the amounts of gold and of quartz, the specific gravities of which are known. If there were absolutely nothing but gold and quartz in the piece experimented with, no air-bubbles, etc., this method would give good results. But as such a case never exists, probably, we should not care to recommend the method. A careful guess from an experienced hand would be just about as trustworthy. As to sawing through the crystals, one way is to fasten the stone on a stand, and cut it with a fine iron or copper wire stretched in a bow and moistened with emery and water.

TWO OF OUR READERS.—The thermometer will indicate the same (or very near the same) temperature whether inserted in the steam or in the water. It must be remembered that the water is under pressure, and the effect in this case was given in lecture III.

Curious Change in Gold Quartz.

At the meeting, last year, of the British Association, Mr. T. A. Readwin read a note on a gold-quartz crystal which he had picked up near Bala Lake, Wales, in 1863. At that time it was quite transparent, but tinged slightly with gold-yellow, and under the microscope the color disappeared entirely. The crystal was labelled and put away in his cabinet, where it remained unnoticed until 1869.

The crystal had then become more opaque and has now all the appearance of a solid crystal of gold, which it has been taken to be quite frequently. The color is pale, but all the gold found in the locality whence it was taken is light colored, as it contains a large percentage of silver, sometimes as high as 20 percent. Mr. Readwin wished to bring to the notice of the association this curious mineralogical fact, which gives room for much interesting speculation.

A NEW BAG FACTORY.—Theodore Metzler is about to start a bag factory at Santa Rosa.

Utilizing Nature's Stores of Energy.

In the report of Prof. Le Conte's lecture, on another page, will be found a classification of the stores in which nature has laid up energy. Now the fact that great loss of power inheres in all our engines for converting heat into motion, and the great amount on our coast of the power included in the professor's third class—the natural motion of air and water—makes the subject of better utilizing this energy especially important to us.

We are greatly interested, both in the cities and in the country, in finding some power cheaper than steam. The alarm has already been sounded that our forests are being thinned out with dangerous rapidity. Moreover, especially in many mining districts, the want of fuel is a fatal drawback to the development of rich natural resources. If we could only use the superabundant energy furnished by the moving waters and winds, it would be a very great advantage. Too little attention has been paid here to these stores of power. At the East and elsewhere, the subject is attracting more attention, although certainly no more important to the development of the country.

Utilizing distant waterfalls, to compress air which can be conveyed in tubes and distributed for general manufacturing purposes, has been suggested but not acted upon. The experiment is now, however, about being tried at Rochester, New York. A company has obtained a charter, and the consent of the city authorities, to use the great Genessee Falls in this way. Pipes will be laid in the streets so that every manufacturer can be supplied with air compressed to the density of say 5 or 6 atmospheres. He has only to turn a stop-cock, and the released air will rush upon the piston of his engine and drive it after the fashion of high-pressure steam. There does not seem to be anything impossible in the idea. The imprisoned water in our hydrants shows how easily the gushing stream might turn a wheel proportioned to its volume and to the height of the reservoir whence it flows. Such powers for petty manufacturers, were provided in Paris, and air-power has advantages which readily occur to one: No dirt, no accidental inundation, no waste pipes, no freezing, no dry seasons, while ventilation is secured to the fullest extent. For the smallest forms of industry, such as sewing machines, it would be admirable.

The Rochester Company is also looking seriously to supplying Buffalo with this power from Niagara Falls, distant 20 miles, (where enough power is wasted to drive all the machinery in the world); and the tidal force at Hell-Gate is being considered with a view to compressed-air power for New York and Brooklyn.

It may well be asked whether something cannot be done for San Francisco. Some two years ago, a proposition was made to harness the tide-wave outside the Heads and make it condense the atmosphere for useful purposes. We believe that the projector had a plan for reservoiring the power thus obtained. The wind-power here is sufficient during eight months of the year to drive any quantity of machinery if it could be harnessed to the works. If there be a useable power in the tidal-wave to compress air, why may not our glorious surplus of winds be utilized in the same way?

If we should cherish the memory of the man who makes two blades of grass grow where only one grew before, how much more should we esteem him who, from what is a nuisance, brings forth benefaction? One of the most money-making companies in France is that which confines itself entirely to the utilization of waste products. Refuse of all kinds is examined, and chemistry usually detects in what we throw away, some valuable product. The sewage of cities in Europe is now being generally utilized, and from the disgusting refuse of coal and petroleum, we get our beautiful aniline colors. Now, why can't we make our savage summer winds work for us as well as against us? The same power that bucks against us, bucks against a windmill to give it rotation, and can certainly drive an air pump, to give compression to the atmosphere, and thus by proxy to turn our machinery. The subject is worthy of consideration.

It would be difficult to over-estimate the

value of such a motive power to our city, if it were furnished at a price that would pay reasonable interest on the investment. The power would be unlimited, and one great obstruction to industry would be withdrawn. Let us hope that the inventive genius of California may be stimulated by the great reward in store for him who succeeds in this enterprise.

Three points are to be considered in this connection: how to catch the power, how to transmit it to the desired point, and how to store it up in a convenient position until directly needed.

In regard to the first point, nothing need be said at present. Our windmills and water-wheels are already very good, for the want of them has been felt in practical life, and attention has been and is being given to the improvement of their construction.

The second point, the transmission of force, is now being studied quite extensively. The use of compressed air has been experimented on to the greatest extent at the Mout Cenis tunnel, and the engineers of this mighty work have expressed themselves strongly in favor of the view that the plan is economical, and that by this method power may be transmitted long distances. Experiments have been made elsewhere, and the question of loss of power by friction, leakage, etc., has been investigated quite extensively.

Hirn's telodynamic cable gives another method. It rests on the principle of the substitution of velocity of motion for mass of matter moved, and consists in employing a cable, supported on pulleys, and driven at a high rate of speed. In France the cable has been used very extensively. In Russia, there is one in use transmitting power from turbine wheels over a distance of some 4,800 feet. In Germany and in Denmark the cable is used; and at the mines of Falun, Sweden, a more than 100 horse power is transmitted over three miles. It is stated that, in this way, 100 horse power may be carried six miles without losing over 25 per cent.; and the expense is given as about \$10,000 for such a cable in Europe.

The idea of conveying power by electricity has been suggested. Dr. Partz, of Oakland, has taken some steps in the matter, and, if we are not mistaken, has applied for a patent on the subject. The general plan would be to convert mechanical force, where such is abundant, into electricity by means of what are known as magneto-electric generators, to convey the currents over proper wires to the required point, and then to re-convert the electricity into motion by the "electro-motors." There is much to be said in favor of such a method, as it would admit of the transmission of power over much greater distances than would be possible by the other plans mentioned.

In regard, finally, to accumulating force in reservoirs, we can as yet state nothing of a satisfactory character. Compression of water, raising water or other material to a high elevation, using springs, accumulation in fly-wheels (as the Mahovos, which have been previously described in the Press), and other ways have been tried; but we know of no method at all applicable for general use and to any great extent, which can be called a success. But if we could only store up the power of our summer winds for winter use, for instance, what a revolution it would make in our manufacturers.

We have merely thrown out a few hints in the matter. The subject is most important and worthy of consideration. Although much may appear visionary just at present, we believe that at no distant period the problem will be forced on man's attention, and will be solved by man's ingenuity.

THE GOLDEN AGE.—This is the name of a new weekly journal devoted to the free discussion of all living questions in church, state, society, literature, art, and moral reform, which is issued in New York. Mr. Theodore Tilton, having retired from the *Independent* and *Brooklyn Union*, will have editorial charge of the paper, and his excellent reputation is a guarantee that the new journal will be of high standard. Subscriptions, \$3 per year, may be sent to him, P. O. Box 2,848, New York City.

NARROW GAUGE.—A telegram from New York, dated Feb. 12, says that the Erie Railroad will expend considerable money, some six millions, in laying a third rail between New York and Buffalo, and "purchasing the equipments for the connections with narrow gauge railways thence to Chicago.

PATENTS & INVENTIONS.

Hallidie's Endless-Wire Rope-Way.

We illustrate to-day an invention, recently patented by Mr. A. S. Hallidie, of this city, for the rapid and economical transportation of such material as ores, lumber or goods, over a rough and otherwise accessible country, as well as for the transmission of power from one point to another. The invention is one of very considerable merit, and as it concerns a matter of the greatest importance to miners and many others on our coast, we describe it fully.

The invention consists in the use of endless iron or steel wire ropes, supported on peculiar sheaves, placed on posts, actuated by the gravity of the descending loads, or by an engine attached to a grip pulley, and carrying hurdens in the manner hereafter described. Similar inventions have been made before, and the merit of this, therefore, depends on the peculiar construction and adaptation to the wants of the localities.

Fig. 1 shows a section of a rough mining region, with the undulations and depressions incidental to such a country, over which it is desired to transport ore from the mine, A, to the mill, B, distant, say, one mile or more. At proper points, from 200 to 600 (usually 250) feet apart, are erected posts, c, with guide-sheaves, on which the rope travels. For the sake of illustration, sacks, d, are shown, in the cut, suspended by proper devices to the rope. Near A and B, at each end of the rope-way, are placed horizontal grip-pulleys, devised by Mr. Hallidie, 8 to 12 feet in diameter, around and in the groove of which runs an endless wire-rope of sufficient length to extend from one pulley to the other and back, so that the full sacks, or cars, can be run down on one side and back on the other.

Fig. 2 shows the construction of the supporting posts. These are set firmly in the ground, and have on top a cross-beam, on each extremity of which are placed grooved sheaves, a, b, freely revolving on spindles attached to the cross-arm, and so arranged, one over the other, that the rope will run between them. The lower sheave, b, supports the rope, and the upper one, a, keeps it from jumping out of place. In order to give a clear idea, a car, C, is shown on one side, and a sack, D, on the other.

Attached to the wire rope at equal distances apart, usually about every 50 feet, are peculiarly constructed carriers. Figs. 3 and 4 show these and the manner of attaching them to the wire; Fig. 3 giving a side view and Fig. 4 an end view. Here a and b are the sheaves, c the rope, and C, the carrier. This carrier is placed in a frame d, which is hung on standards, e, in such a manner that the carriers will always maintain a horizontal position, whether going up hill or down. The standards, e, are attached to a bar, f, shown on a larger scale in Fig. 5. The end of the bar is swaged out into a band which encircles the wire rope and is riveted to the bar, so as to hold the rope tightly. The bar, f, is about one half the size of the rope and as the center of gravity of the load comes vertically below the wire, this bar always stands out horizontal, and thus allows the load to be carried past the sheaves and pulleys without interference. One end of the carrier is an apron, g, which enables the load to be easily dumped.

Instead of such a carrier, sacks may be used if preferred. The simpler arrangement for attaching the sacks, essentially the same as in the case of the carriers, is shown at g, Fig. 2.

Fig. 6 shows the patent grip pulley employed at each end of the line; Fig. 7 is a section of the rim of the pulley, showing the mode of construction. The rope is denoted by k; i, i are clips working on a fulcrum, j, j. The rope pressing on the clips at the bottom, as it enters them, causes them to close over it, gripping it securely and preventing its slipping. The part of the rim, k, is cast separately, and bolted to the main wheel, l, by the bolt, m, m. The rim of the wheel is cast with recesses to take the clips, fitting them and allowing them to work freely; while the clips cannot possibly be displaced, except by removing the part, k, which is cast separate for this purpose.

From this it will be readily understood that the rope is grasped as soon as the

pressure begins to act on the clips, and is released as soon as the pressure is removed, the whole acting automatically and invariably. For conveying power over long distances, this feature is of the greatest value.

A carrier is shown in Fig. 8, which may be found very useful in certain cases, as it economizes in manual labor. A car, *n*, is mounted on wheels so that it can be run into the mine. It has a carrying frame, *p*, above it, the longitudinal beam of which is inclined so as to correspond with that of the standards, *r*. Both are toothed, the former on its lower, the latter on its upper side. Now if the car be run into position, when the standards, *r*, which are attached to the rope, come around, they will catch and carry off the car without any manual labor. The teeth on the beams prevent any slipping.

The general system and manner of working of the rope-way will now be understood by a glance at Fig. 1. By it, material can be transported from a higher to a lower, or from a lower to a higher point. In the last case, power must be applied, which can be done directly from a stationary engine at one end by means of the grip-pulley; in the first case, often no extra power will be needed, the gravity of the descending loads being sufficient to keep the rope in motion.

In erecting this system, after the route has been decided on, posts are placed on

Fig. VIII.

the prominent points, being of a sufficient height that the rope may be clear from all obstructions on the ground,—as snow, rocks, cattle, etc. At suitable distances between these (which serve to fix the principal points of the line), say, 300 feet apart, other posts are erected to support and lead the traveling wire. The height and number of these are regulated by the configuration of the line and the necessities for sustaining the rope.

The posts being in position and the grip-pulleys being in working order, the coil of wire rope is placed at the upper terminus of the line, and one end is put in the grip-pulley and carried along from one post to another, being placed between the sheaves on the posts. A brake attached to the grip-pulley regulates the paying out of the rope. One coil being exhausted, the end of the next one is joined to it by a long splice, and the operation is continued until the rope has been carried down one side. Another wire rope is then, in a similar manner, brought up the other side, and the two ends are spliced, the wire rope being placed in the groove of the upper pulley. By means of a powerful purchase at the lower end, the rope is stretched tight, spliced and put in the lower pulley.

At the lower end, provision is made, by a suitable frame and apparatus, for taking up the slack which occurs for some days after the rope is put on, and then disappears. The carriers are then attached and the line is ready for work.

Cost and Running Expenses.

The following is the estimate of the cost per mile for a line with sufficient descent to run itself by gravitation:

2 Miles of 2-in. Circ. Steel Wire Rope.....	\$2,534
2 Grip-Pulleys and Frame.....	400
17 Posts, with Sheaves complete and erected at \$30.....	510
21 Carriers (plain hook) at \$6.....	1,266
Erecting and Splicing Wire Rope.....	300
Total Cost per mile.....	\$5,010

The life of a steel wire rope may be placed at four years; of end-apparatus, four years; of posts, seven years; of the running posts, two years.

The running expenses, per year, may be estimated as follows:

1 Brakesman at \$100 per month.....	\$1,200
1 Supply man at \$65 per month.....	780
1 Delivery man at \$65 per month.....	780
1 Line man at \$75 per month.....	900
	4,660

Oil and Grease.....	180
Tar Mixture for Rope.....	240
Wear and Tear of Rope.....	635
Wear and Tear of other parts.....	9.0
Interest on Cost, 10 per cent.....	501
Incidentals.....	884
	3,340

Total per annum.....	\$7,100
Average per day (300 working days).....	\$23.33
Average per ton per mile (100 tons per day of 10 hours).....	23.33 cts.

The running expenses depend on the wear and tear of rope and apparatus, and in the fact whether extra power is required,

Fig. I.

ing or road building is required. It can work under all circumstances of weather, with great depths of snow on the ground, during heavy storms and freshets. It can run constantly without rest; as well during a dark night as a clear day. It can cross deep gorges and chasms. It can pass around precipitous bluffs and perpendicular cliffs. The rope can never leave the posts or sheaves. It can furnish and transmit power when there is sufficient descent by its own gravitation, or by an engine attached to either end. It can be constructed and worked cheaper than any other system or road can be constructed and worked. By using the duplex carrier it can convey

or whether the line will work by gravitation. Assuming the line to be 2 miles long, that is, the distance between the mine and the mill,—10560 feet; the difference in al-

Fig. III.

Fig. II.

titude, 2000 feet; speed of rope, 4 miles = 21120 feet; distance between carriers, 50 feet; load of each carrier, 50 lbs. (this may be 150 lbs.)—then the result is, 21120 ÷ 50 × 50 = 21120 lbs. ore delivered per hour = 10½ tons.

Application—Advantages.

The foregoing system is applicable for the following purposes: For conveying ores from the mine to the mill. For conveying light loads of any material from place to place. For transporting lumber across difficult points, and to shipping in an offing. For conveying passengers across gorges, chasms, and over hazardous roads. For supplying water to reservoirs across chasms, etc.

The advantages claimed are: No grad-

any material, such as lumber, goods, ores and even passengers, from place to place.

A reference to the article on the preceding page shows that such a contrivance

the patentee, Mr. A. S. Hallidie, San Francisco, Cal.

WOODEN SHOES IN MAINE.—Nice wooden shoes are manufactured by the Swedish colony in Maine. A pair costs forty cents, and two hours time is consumed in the manufacture.

Notices of Recent Patents.

TIRE FOR TRACTION ENGINE.—O. Hyde, Oakland. The advent of the Thompson Road Steamer has awakened a new interest in the matter of traction engines, and rendered any subject connected with them of special importance. The rubber tire being the principal point, there is nothing more natural than that efforts should be made to improve this. Mr. Hyde has introduced a very ingenious device of the kind. He employs cylindrical or polygonal blocks of rubber placed side by side around the wheel. These blocks can have a central hole in order to have greater contractive and expansive power. The triangular spaces between the outer parts of the blocks are filled by wooden or metallic wedges, which are secured to the vertical rims of the wheel by links, which extend downwards at an angle and are bolted to the rims, the bolts passing through slots so that they can play back and forth as the wedges are compressed and return to their original position. These wedges unite the whole into a compact tire and prevent the elastic cylinders from being displaced. By this combination and arrangement, the metallic tires of traction wheels can be encircled with a cheap, substantial and efficient elastic tire which can easily be fitted and easily repaired in case of necessity.

DIRECT ACTING STEAM ENGINE.—W. D. Hooker, San Francisco. This is an ingenious and, apparently, very efficient improvement in that class of steam engines which are particularly adapted for steam pumps and the like, where it is necessary to be able to start the piston from any point in the stroke,—an important object which it is difficult to obtain with certainty. Mr. Hooker's invention consists in a combination of valves to effect this, and a combination of the main and auxiliary valves with the main piston of the engine, so that the action of the valves is made certain. For a pin projects into the cylinder, in such a way that the piston strikes this and thereby moves the auxiliary valve, so that no ordinary trouble can prevent its admitting steam to the main valve. It consists also in an arrangement for arresting and cushioning the piston at the end of the stroke, this being in connection with the action of the auxiliary valve just alluded to. The details of the construction cannot, of course, be plainly and fully described without the aid of explanatory drawings, and we can therefore merely touch on one or two points in a general way; but the invention deserves the careful examination of mechanics.

CO-OPERATION WITH EMPLOYERS.—At the extensive Consett Iron Works, in England, where employment is given to some 5,000 workmen, there is much done both by the company and by the men for the mutual benefit. The company keep up schools with reading rooms, etc., and means for recreation, possess 1,500 workmen's cottages, provide a surgery and an infirmary for men injured in the works. A staff of five surgeons is employed and paid by the workmen, who have also a co-operative store.

IS IT A SWINDLE?—Mrs. S. T., 222 Chestnut street, Manchester, N. H., having spent considerable money on stock of the Garner Gold Mine, on the Main Tuolumne river, Tuolumne county, Cal., desires to know whether the affair is a swindle. Can anyone tell her or us?

CANCER article next week.

OMITTED.—We are obliged to omit this week communications from Bull Run, Banner District and Cerro Gordo, report of the N. Y. Society of Practical Engineering, notices of publications, and other matter which was already in type.

NOTICE.

THE undersigned having completed arrangements
through one of the first "Promoters" in Europe, for
placing CALIFORNIA MINING SECURITIES ON THE
LONDON MARKET, is now able to offer superior facili-
ties for disposing of reliable mines of gold, silver or
other minerals, as above stated. All properties given in
my charge will be placed direct, without loss of time,
upon the London Market, through a perfectly reliable
party, long resident and entirely familiar with the busi-
ness. Every advantage offered to parties owning shares
in American mines worked by English capital, to dis-
pose of the same. Advances made and ample security
given when required.

STEAM JET PUMP.
Blakes & Williams' Patent, for
Water, Oils, Acids, Etc.

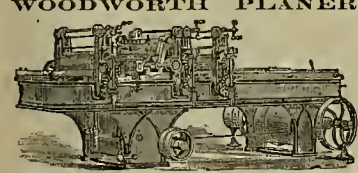

The best COLD WATER
PUMP for filling tanks for
stationary or portable
Steam Engines. Also high-
ly recommended for
MINES, BISTILLERIES,
SALT WORKS, STONE
QUARRIES, and similar
places, and saves the ex-
pense of putting up and
running an engine.
We ask the attention of
all proprietors of steam
power to the following
points of merit:—It is
operated by steam taken
directly from the Boiler
into the Pump; it has no
valve or wearing parts of
any kind; it requires no
belts, pulleys, or machin-
ery of any kind; it oper-
ates entirely independent of an engine; it will not choke
up with foul water; it costs much less to put up and
start; it will not wear out in a lifetime, or require re-
pairs; it is reliable, and certain to work at all times; it
is not liable to injury from freezing.
Satisfaction guaranteed or the money refunded.
Send for Circular. **PARKER & HUNT,**

Complete Volumes—Bound or unbound—of the
SCIENTIFIC PRESS from Jan. 1, 1864, to date, can be had
at reasonable rates at this office. They contain much
valuable information.

STEVENSON'S PATENT MOULD BOARD AMALGAMATING PAN.

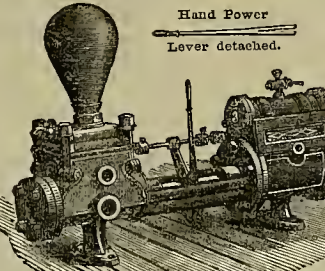

This Pan is far superior to all others
in several important particulars. The
grinding mullers are near the center, re-
quiring less power. The plow-shaped
grooves raise the quicksilver with the
pulp regularly, with less power, without
violence, and with better amalgamating
effect, besides admitting of a larger
charge. The inclined-shaped housings
of the muller-plate openings efficiently
force the pulp directly under the mul-
lers.

It has been constantly running for
over eight months, and has proved, in
comparison, to produce a higher per-
centage of bullion, with less power and
with great saving of quicksilver, over
any other pan in use. It is simple in
construction and operation, and cheaper
in first cost and economy in wear.

Manufactured at the Golden State Iron Works (Co-operative), 19 First street, S. F.,
Where it can be examined and further particulars be learned; or persons may apply to the inventor and pat-
entee, Mr. C. C. STEVENSON, at the Douglas Mine, GOLD HILL, STATE OF NEVADA, where the Pan has been long
been in constant operation. 15v20-1m, lam1f

BLAKE'S PATENT STEAM PUMP.

These Pumps have been tested, and found to be indisputably without an equal wherever tried. They are constructed
in the most simple style, and built in the most thorough manner—especially calculated for simplicity, durability and power.
Some of the advantages of the Blake Pump may be summed up as follows: It is positive under any pressure. May be
run slow or fast, as may be de-
sired. Will discharge more water
than any others of the
same dimensions. Has no leaky
joints, the steam part being cast
in one entire piece. The steam
valve is perfectly balanced, is
cushioned at each end, and
slides with the greatest facility
having no cams, nor complex
Rotary arrangements to get out
of order. Will start at any
point of the stroke, and will dis-
charge all the water of condensa-
tion. The Pump has no crank
or fly-wheel, thereby saving a
considerable item of expense to
the purchaser. Having no dead
points, it therefore needs no
watching, and is consequently
ready to start without using a
starting bar or any hand work
whatever. The Blake Pump is
extensively used on Railroads
and Steamboats; in Hotels; for
Mining and Fire purposes; in
Breweries, Tanneries, Sugar
Pump on Exhibition. The agents have recently imported several of the largest sized Mining Pumps for water works, and
deep mines, and will be pleased to refer parties to them; we claim for it, that it is the most simple and durable, and conse-
quently the best Steam Pump ever built. For sale by **BERRY & PLACE,** Machinery Depot, 112 and 114 California st.,
San Francisco, who will be pleased to send circulars to any address, or show its advantages to parties calling on them.

VAN NOSTRAND'S
Electric Engineering Magazine,
Commenced January, 1869.

Consists of articles selected and matter condensed
from all the Engineering Scientific Serial publications
of Europe and America.
The third volume of this Magazine is completed by
the issue for December.
The growing success during the past two years demon-
strates the correctness of the theory upon which the en-
terprise was founded. Communications from many
sources prove that the Magazine has met a widespread
want among the members of the engineering profession.
A summary of scientific intelligence, selected and sifted
from the great list of American and European sci-
entific journals is at present afforded by no other means
than through the pages of this Magazine.
In the next volume, beginning with the January num-
ber, we shall commence some important improvements.
Each number of the Magazine will hereafter contain
something of value relating to each of the great depart-
ments of engineering labor.
More space than heretofore will be devoted to short
discussions or circulations of important formulae, espe-
cially such as have proved valuable in the practice of
working engineers; our facilities for affording such items
are extensive and rapidly increasing.
The progress of great engineering works in this coun-
try will be duly chronicled.
Selected and condensed articles, with their illustra-
tions, from English, French, German, Austrian, and
American scientific periodicals, will contribute to make
this Magazine more than ever valuable to the engineer-
ing profession, and will afford a compilation without
which the library of the working engineer will be in
complete.
112 Pages, Large 8vo. Illustrated Monthly.
Price \$5.00 a year in advance, single copies fifty cents.

Notice to New Subscribers.
Persons commencing their subscriptions with the
3d year (January, 1871), and who are desirous of possess-
ing the work from its commencement, will be supplied
with Volumes I., II., and III., neatly bound in cloth, for
\$10.00, sent free by mail on receipt of price.
Notice to Clubs.
An extra copy will be supplied gratis to every club
of five subscribers at \$5 each, sent in one remittance.

THE AMERICAN CHEMIST

EDITED BY
CHAS. F. CHANDLER, Ph. D., and W. H. CHANBLER.

TABLE OF CONTENTS
For September and October, 1870

Articles:—
On the Analysis of Coal-Tar Colors. By W. H. Perkins.
London Gas Refractories and the Sulphur Question. By W.
Electro-Deposition of Copper and Brass upon Iron. By W.
H. Walcott.
Electro Coating Iron with Copper and Brass. By W. H.
Walcott.
The Various Qualities of Sugar produced in Cuba, and the
Different Modes of Manufacture. By Edward Beates.
Carbonic Photographs. By W. H. Chandler.
On some circumstances which favor the simultaneous Pre-
cipitation of Alumina and Magnesia by Ammonia. By
Laurence F. J. Winkler.
On estimation of Ferrous Oxide in Presence of Ferric
Oxide in Siliceous Minerals. By Charles A. Wilbur and
Walter Whitteley.
The Nineteenth Meeting of the American Association for
the Advancement of Science.
On the Temperature and Heating Powers of Flames. By
W. M. Watts.
Experiments on the Effect of Alcohol (Ethyl Alcohol) on the
Human Body. By E. A. Parkes and Count C. Wol-
lowitz.
Composition and Quality of London Waters.
Analysis of a Zinc Ore from Blair Co., Pa. By L. Preston
Ashland.
On the Precipitation of Metals of the Magnesium Group in
the Form of Oxalates. By W. Goud Leeson.
Heinrich Gustav Magnus. By A. Oppenheim.
Analysis of Deep Sea Water. By John Hunter.
On Animal Charcoal in its use in Sugar Refining. By Dr.
Wallace.
On the Estimation of Peroxide of Manganese in Mangan-
ese Ores. By John Pattison.
Assay of Manganese Ores. By Edward Sherrin.
Zinc and Sulphurous acid. By E. W. Gibson.
Determination of Carbon in Steel. By W. D. Herman.
Presence of Potash in Chromate of Lead. By T. L. Philip-
son.
Concentration of Bisulphide of Carbon. N. V. Wartha.
Determination of Iron in Cast-iron. By C. Menz.
New Method of Heating Stoneware Vessels. By J. A.
Coffey.

Chemical Notices:—

POPULAR LECTURES.

Vaporization and Elastic Force of Steam.

[Prof. JOHN LECONTE before the MECHANIC ARTS COLLEGE, Mechanics' Institute Hall, S. F. Reported expressly for the Press.]

Heat and Work.

LECT. V., Feb. 11.—In my last lecture, said the Professor, I stated that heat was convertible into work and work into heat. It is of importance to find out how much work is necessary to generate a certain amount of heat, or how much heat is required to perform a certain amount of work. The most accurate experiments to determine this were made by J. P. Joule, of Manchester, England, who was engaged from 1843 to 1849 in these researches. Before speaking of these, I must say something about what the units of heat and work are. If we measure anything, we must have a unit to refer to. Thus, for distances we have a unit of length; for weights a unit of weight, etc.

All units are necessarily arbitrary, and unfortunately different nations have chosen different units. The English unit of work is that required to raise one pound one foot high, or, as it is called, one "foot-pound." The French unit is a meterkilogramme, raising one kilogramme one meter. The English unit of heat is the amount of heat necessary to raise the temperature of one pound of water from 32° to 33° Fah. The French unit is the amount required to raise the temperature of one kilogramme of water from zero to 1° Cel.

Joule sought to ascertain the relation of heat and work by means of the apparatus here shown. In a copper vessel, A, were sixteen metallic paddles, *a*, eight in a horizontal row, attached to a shaft, *d*, and revolving between eight strips of metal, *c*, which were fastened to the sides of the vessel. The vessel was filled with water and the paddles made to revolve by the weights, B and D, which sank down a distance of 63 inches. When these touched the ground, the pin, *o*, connecting the shaft and the cylinder around which was wound the cords, was taken out, the weights wound up without moving the paddles, the pin replaced and the operation continued. When the weights had sunk 20 times, the temperature of the water was taken and the heat generated by the motion of the paddles thus found, and the mechanical work of the weights was calculated. The experiments were repeated with mercury and an iron vessel; also by rubbing two metals together. In each instance the increase of heat was found and the work performed; thus was obtained the relation of the heat developed and the work done. Then he calculated how much work was equivalent to the unit of heat.

Result of Experiment—Heat and Motion.

Joule's experiments established two things: 1st. The quantity of heat produced by the friction of bodies is always proportional to the work performed and is independent of the surfaces employed. 2d. The mechanical equivalent of a unit of heat is 772 foot pounds. That is, the work necessary to raise 772 lbs. one foot, or one pound 772 feet, is sufficient to generate heat enough to raise one pound of water one degree. Or, in other words, 772 lbs. falling one foot, or one pound falling 772 feet, would suffice to generate the same heat. The experiments of Joule's are regarded as most delicate and the results most accurate, the probable error being not over 1-300 of the figure given.

We can reduce this to horse-power. As one horse-power is taken as 33,000 foot pounds per minute, it is therefore equal to 42.75 lbs. of water heated 1° (Fah.) per minute.

The principle of the convertibility of heat and motion leads us to interesting conclusions. If a mass of lead weighing 38.6 lbs. fall 100 feet, this would be sufficient to heat one foot of water 5 degrees. For

$$\frac{38.6 \times 100}{772} = 5 \text{ units of heat.}$$

If the motion is horizontal the case is the same. If a cannon ball strikes a target, heat is generated, and we can easily calculate the amount of heat. In firing a lead ball against an iron (or other hard) target, we often get heat enough to melt the ball, as has been proved. Fairbairn says that at Shrobury, England, where experiments have been made with the Whitworth and the Armstrong cannon, he has seen,

even in daylight, a broad sheet of flame when the balls struck the target.

Best Possible Work of Steam Engines.

If we compare the mechanical effect obtained by our steam engines with the heat used, we find that only a small portion of the mechanical equivalent of the heat is obtained. It has been claimed that some of the best Cornish engines have given 20 per cent. or one-fifth; but this statement is doubted. The ratio varies from 1-50 to 1-5, the former being exceedingly low and the latter very high; we may say for ordinary cases from 1-25 to 1-8.

The total heat produced by the combustion of our fuel is expended in producing the following effects:

1. The waste heat of the furnace; say, all the way from 15 to 60 per cent.
2. The necessarily rejected heat used up in internal work.
3. The heat wasted by the engine, by conduction, etc.
4. The useless work of the engine, as in overcoming friction, etc.
5. The useful work performed.

Now in regard to points 1, 3 and 4, the mechanic can do much, but in regard to point 2, the case is different. If we had an engine of absolute perfect theoretical construction, with no waste heat, friction, or other imperfection, it would give only a partial return of the heat produced by combustion of the fuel. The amount of this necessarily rejected heat has been reckoned. The following formula gives the maximum work possible with a perfect engine:

$$\text{Maximum Work} = H \times \frac{a-a'}{a} = H \left(1 - \frac{a'}{a}\right)$$

Here *H* is the whole heat going into the engine, *a* is the absolute temperature of the boiler, and *a'*, that of the condenser.

By the absolute heat, we mean the heat reduced to the absolute zero of the gas thermometer; that is, to the point where the gas loses all elastic force, viz. at about 273° below zero, Celsius.

Now if the temperature of the boiler = 152° (Cel), and therefore its absolute heat

= 152 + 273 = 425°; and the temperature of the condenser = 30°, or absolute temp. = 30 + 273 = 303°,—the maximum effect will be

$$H \times \frac{425-303}{425} = H \times \frac{122}{425} = 0.28\frac{1}{2} H, \text{ i. e.}$$

the maximum effect can be only 28½ per cent. of the whole amount of heat used. If the temperatures were 180° and 30°, it would be about 33 per cent. If they were 202° and 30°, it would be about 36 per cent. If they were 134° and 30°, as is about the case with Cornish boilers, it would be about 25½ per cent. If they were 400° and 100°, it would be 44 per cent.

Now there are several ways in which we can reduce this amount of necessarily rejected heat used in internal work, and thus hope to better our engines. One is by keeping the boiler and also the condenser at fixed temperatures, which is already pretty well accomplished. Another, as is obvious from the formula, is by having the greatest difference between the temperature of the boiler and that of the condenser (*a* and *a'*). This may be accomplished in two ways: by making the condenser very cold or the boiler very hot. But we cannot practically very well cool down the condenser below the temperature of its surroundings, the air etc. Hence the only way left is to make the boiler very hot.

But so far as saturated steam (steam generated and heated in the presence of water) is concerned, we have already nearly reached the limits of safety. Hence we are

forced to look to the use of super-heated steam (not in the presence of water) for an advancement. Or we may look to some gas or vapor. To obviate the loss incurred in the manner just treated of, Ericsson has attempted to use heated air, and his "caloric engine" will be remembered by many. If the mechanical difficulties thereby incurred can be overcome, hot air may play an important part in this way.

In What is Energy Stored up?

The stores from which man derives energy may be reduced to the following:

1. Food of Animals. The food is burned up, and thus is obtained the heat necessary for existence and also for work. If we reckon the mechanical equivalent of the heat thus produced, we find that the horse-machine or the man-machine is far more perfect than the steam engine. [A ton of hay will produce much more work if eaten by a horse than if burned under a boiler.]
2. Solid matter in elevated positions. This is limited in amount.
3. Natural motion of water and air.
4. Natural combustibles, as wood, coal, etc.
5. Artificial combustibles, as prepared chemicals. Limited.
6. Natural heat.

Now we can trace all the energy accumulated in these stores to three sources:

- A. Solar heat and light.
- B. Motion of Earth; action of moon and sun.
- C. Terrestrial sources; hot springs, native sulphur.

As far as man is concerned, we may say that all his energy is derived from the sun. His food is vegetable; either directly, or derived through animals. Now the vegetables grow exclusively through the influence of solar light and heat. Their leaves

are the laboratories in which these agencies work with tremendous force, decomposing carbonic acid and storing up the carbon. This force come again into play when man, by eating, burns up this carbon. So with the combustibles, coal and wood, etc. So with water-power; the sun has heated and evaporated the water, which is condensed and falls in high places to again return to the sea. With tides, it is different. Yet nearly all energy may be referred to the sun.

The Sun's Heat—Man Condensed Sunlight.

Is this supply of power (in the sun) sufficient for all these purposes? Pouillet has calculated that the heat expended on each square meter of surface every minute is equal to about 0.4 horse power, or a total of 211,000,000,000 horse-power per minute. If we estimate the amount of water evaporated by the rain-fall, this is sufficient to form a stratum five feet deep, while this heat of the sun would be able to evaporate a stratum 12½ feet deep. Hence we have heat enough to evaporate a stratum of water 7¼ feet deep left to sustain the growth of vegetables, give rise to winds, etc., etc. It would seem, however, only a question of time as to how long this source of energy will exist.

Looking from this point of view, it does not seem so strange that the Orientals should have worshipped the sun, although they knew not how much they were indebted to it. In one sense, men can be called merely condensed sunlight. The monarch and the peasant are but children of the sun; but to this brotherhood belong just as much the Ichthyosaurus, the Trilobite, the spider and the fly.

You will remember how Gulliver in his travels came across a certain set of abstract philosophers who were engaged in extracting sunbeams from cucumbers. After what has been said, this does not appear altogether so ridiculous; the sun's light and heat can be obtained in part therefrom. The proverb says that "love-sick swains and languishing maids feed on moonbeams;" and philosophers show that the moon's feeble light does do something for the growth of vegetables, and therefore may be converted into the energy expended in a sentimental serenade or a long-drawn sigh.

In concluding his remarks, the lecturer

expressed the opinion that of all the discoveries of the century, that of the correlation of forces will be hereafter esteemed the greatest. He dwelt on the importance of this and the great influence it has on other subjects. This lecture finished Prof. John LeConte's series. E. S. Carr, Professor of Agriculture and Agricultural Chemistry, will deliver the next course.

Ice-Boats and Fast Trains.

The Dutch amusement of steel-runner boat-sailing on the ice has been introduced upon the Hudson. There is a club at Poughkeepsie which owns a number of such boats, two of which are called the Zephyr and the Icicle. A short time ago these boats had a race with the Chicago Express train on the Hudson River Railroad. The race is thus described by a correspondent of the New York Times.

On the day named, the wind blew hard from the southwest, striking the boats on the quarter. Both vessels were on the ice north of the Whale Dock, and at a standstill within one hundred feet of the east shore, when the whistle of the locomotive of the train with which they were to race sounded. This to the tiller-men of the Zephyr and Icicle was a starting signal. In an instant they were in their boats lying at full length, when they "down stick" and put their crafts on the wind. Then came the race. The passengers on the cars raised the windows and waved their hats and handkerchiefs; the engineer blew tantalizing whistles as his train thundered through the rock-cuts and over bridges, leaving the ice-boats gradually way astern.

Suddenly the breeze freshened. The canvas on the boats swelled out, the rigging tightened, the steel runners commenced humming over the clear, smooth, black ice, and then the tiller-men of the boats knew they had their iron-bound adversary. The Zephyr rapidly overhauled the lightning train with "bow dead to the north," and then the excitement all over the train, from the engineer to the hind brakeman, was of the liveliest nature. Close behind the Zephyr followed the Icicle, boats flying along with lightning rapidity. Again the waving of handkerchiefs and hats and the blowing of the locomotive whistle added excitement to the scene. Soon the novel craft had passed the fast train and were far ahead, slipping over the ice at the rate of a mile a minute. Never was there a prettier race and never was a railroad train, and a fast train at that, so very badly beaten. Running into the poor ice district the victors whirled about like a flash and headed down the river, again giving the engineer of the train as it came along a parting wave, the latter sending whistling shrieks from his machine in response, and the passengers also giving farewell waves of hats and handkerchiefs.

The winter has been unusually favorable for such sport. Reports from all points east and north, on Sunday last, showed intensely cold weather. The Hudson was frozen up again above Peekskill. At Montreal the thermometer marked 26° below zero, and at Toronto 17°.

THE LOWEST TYPE OF HUMANITY.—

On the Island of Borneo there has been found a certain race of wild creatures, of which kindred varieties have been discovered in the Philippine Islands, in Terra del Fuego, and in South America. They walked unusually, almost erect on two legs, and in that attitude measure above four feet in height. They are dark, wrinkled and hairy. They construct no habitations, form no families, scarcely associate together, sleep in caves or trees, feed on snakes and vermin, on ants, eggs, and on each other. They cannot be tamed or forced to any labor, and are hunted and shot among the trees like the great gorilla, of which they are a stunted copy. When they are captured alive, one finds with surprise that their uncouth jabbering sounds like articulate language. They turn up a human face to gaze at their captors, and females show instincts of modesty; and in fine, these wretched beings are men.—*Atlantic Monthly*.

WALKING.—A scientific lecturer on walking says his experiments show that one side of the body always tends to outwalk the other side. It is not possible when the eyes are shut to walk in a straight line for any length of time, and it will be found where persons lose their way, that they almost invariably wander off to the right rather than to the left.

UNWORKED COPPER VEINS.—The *Territorial Enterprise* thinks that Nevada has copper veins rich enough to pay for working. It cites a couple of instances of rich deposits, thus:

In 1861, a friend of ours discovered a copper mine near Pyramid Lake, and brought in from the lead ten or fifteen pounds of specimens of native copper; but no one would look at copper at that time, and our friend never went back to his mine. The mine is still there and the native copper is to be seen upon the very surface for a space of over 1,000 feet where the lead runs through the serpentine rock. A day or two since, a man who is herding stock near the lake brought in from the lead a whole barley sack full of native copper. Some of the specimens were six inches in length and of beautiful forms resembling oak leaves and the leaves of maples and other trees. Although all admired the specimens, not a man could be found who cared enough about the mine to accept a share as a free gift, and the gentleman who brought in the specimens left the town disgusted with his mine and all our capitalists. There the lead lies, native copper on the surface for over 2,000 feet, and as yet no one has ever dug into it even to the depth of one foot. They all cite Copperopolis, California, and with a shrug of the shoulders say, "Copper don't amount to anything."

NEW NARROW GAUGE PROJECT.—A narrow gauge road between San Francisco and Menlo Park is projected. According to the *San Mateo Gazette*, residents along the proposed route are working for it, and nearly enough money has been subscribed to meet the expenses of a preliminary survey. The route will probably be along the Bay between San Mateo and this city, and the estimated cost is about \$300,000.

1000 Farms

In Los Angeles County,

For Cotton, Wheat, Corn, Grapes, Oranges, etc. The "Abel Stearns Ranch," 200 square miles in sections, quarter sections, etc., on Government system survey, forming blocks one mile square, with road on each side, fronting on the ocean, the railroad to San Francisco to pass through them, the unsold portions subdivided, for sale on long credit, or rent. The famous Anaheim is on this tract. For Maps, Circulars, etc., apply to E. F. NORTHAM, 432 Montgomery st., San Francisco, or TIMO, LYNCH, at Anaheim and Los Angeles. 1722-2ms

SUCCESS IN BUSINESS.—Success in the business world usually depend upon being thoroughly prepared for its duties. Young men! if you would succeed in your business career, secure a good practical business education. This question being settled, the next is where to go. Why, go to the best, of course. Go to HEALD'S BUSINESS COLLEGE, located in the new College Building, 24, Post Street, San Francisco. This is the only school upon the Pacific coast where young men can depend upon being thoroughly fitted for Bankers, Merchants, Clerks, and Book-keepers. This school is connected with the "International Business College Association" or Bryant & Stratton chain. Its scholarships are good for tuition in any of the forty colleges, located in all the leading commercial cities of the United States and Canada. There are many interesting features about the school which can be discussed here. Call at the College and examine its workings. If unable send for circulars and HEALD'S COLLEGE JOURNAL, which will be sent free upon application. Address, E. P. HEALD, President, Business College, San Francisco, Cal. 2372-3ms

MARAVILLA COCOA.—For Breakfast.—The *Globe* says: "Various imitations and manufacturers have attempted to attain a reputation for their prepared Cocoas, but we doubt whether any thorough success has been achieved until Messrs. Taylor Brothers discovered the extraordinary qualities of 'Maravilla' Cocoa. Adapting their perfect system of preparation to this finest of all species of the Theobroma they have produced an article which surpasses every other Cocoa in the market. Entire solubility, a delicate aroma, and a rare concentration of the purest elements of nutrition, distinguish the Maravilla Cocoa above all others. For homeopaths and invalids we could not recommend a more agreeable or valuable beverage." Sold in packets only by all Grocers, of whom also may be had Taylor Brothers' Original Homoeopathic Cocoa and Soluble Chocolate. Steam Mills—Brick Lane, London. 1572-3

At the age of forty or thereabouts the eyesight requires the aid of magnifying glasses. Miller's Brazilian spectacles are acknowledged to be the best in use.

LEA & PERRINS' CELEBRATED

Worcestershire Sauce.

Declared by Connoisseurs to be the only good SAUCE. The success of this most delicious and unexcelled Condiment having caused its name to be applied to the name "Worcestershire Sauce" to their own inferior compounds, the public is hereby informed that the only way to secure the genuine is to ask for LEA & PERRINS' SAUCE, and see that their names are upon the wrapper, labels, stopper and bottle.

Some of the foreign markets having been supplied with a spurious Worcestershire Sauce, upon the wrapper and labels of which the names of Lea and Perrins have been forged, L. and P. give notice that they have furnished their correspondents with power of attorney to take instant proceedings against manufacturers and vendors of such, or any other imitations by which their right may be infringed.

Ask for LEA & PERRINS' Sauce and see name on wrapper, label, bottle and stopper. Wholesale and for export by the Proprietors, Worcester: Cross and Blackwell, London, &c., &c., and by Grocers and Oilmen universally. Agents, CROSS & CO., San Francisco. 1722-1700w

THE FULTON IMPROVED PLOW.

Patented September 27, 1870.

See last No. of the Press for description, or address the inventor for circular, DAVID FULTON, St. Helena, Napa county, Cal.

The California Powder Works

NO. 314 CALIFORNIA STREET, SAN FRANCISCO.

Manufacturers and have constantly on hand

SPORTING, MINING, AND BLASTING POWDER,

Of SUPERIOR QUALITY, FRESH FROM THE MILLS. It being constantly received and transported into the interior, is delivered to the consumer within a few days of the time of its manufacture, and is in every way superior to any other Powder in Market. We have been awarded successively

Three Gold Medals

By the MECHANICS' INSTITUTE and the STATE AGRICULTURAL SOCIETY for the superiority of our products over all others. We also call attention to our

HERCULES POWDER,

Which combines all the force of other strong explosives now in use, and the lifting force of the most ELASTIC POWDER, thus making it vastly superior to any other compound now in use.

A circular containing a full description of this Powder can be obtained on application to our Office. 16720-3m JOHN F. LOHSE, Secretary.

Mining and Other Companies.

Owing to the time necessary to mail the present large edition of the SCIENTIFIC PRESS, we are obliged to go to press on Thursday evening, which is the very latest hour we can receive advertisements.

Deep Spring Milling and Mining Company.

Location of Works, Deep Spring Valley Inyo County, California. Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the 14th day of January 1871, an assessment of \$1 per share was levied upon the capital stock of said Company, payable immediately in United States gold coin, to the Treasurer at his office 306 Clay street, San Francisco.

Any stock upon which said assessment shall remain unpaid on the 25th day of February 1871 shall be deemed delinquent and will be duly advertised for sale at public auction, and unless payment be made before, will be sold on Saturday the 4th day of March 1871, to pay delinquent assessments, together with costs of advertising and expenses of sale. By order of the Board of Trustees. A. H. JORDAN, Sec'y pro tem. j228 [340 Montgomery st., San Francisco Cal.

Eagle Quicksilver Mining Company.

Location of works, Santa Barbara County, California. Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the 5th day of February, 1871, an assessment of twenty (\$20) dollars per share was levied upon the capital stock of said Company, payable immediately in United States gold and silver coin, to the Secretary, at his office, Room 5, No. 302 Montgomery street, San Francisco, California. Any share upon which said assessment shall remain unpaid on Tuesday, the 4th day of April, 1871, shall be deemed delinquent, and will be duly advertised April 6th, 1871, for sale at public auction, and unless payment shall be made before, will be sold on Monday, the 10th day of April, 1871, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees. WM. H. WATSON, Secretary. Office, Room 5, No. 302 Montgomery street, San Francisco, California. fil-5w

El Refugio Petroleum Company,---Location Santa Cruz County, State of California.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company held on the 18th day of January 1871, an assessment of sixty five (65) cents per share was levied upon the capital stock of said Company payable immediately in United States gold coin, to the Secretary R. Wegener, No. 414 California street San Francisco, California.

Any stock upon which said assessment shall remain unpaid on the 21st day of February 1871, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Tuesday the 14th day of March 1871, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees. R. WEGENER, Secretary. j221 Office, 414 California street, San Francisco, Cal.

General Agents for the

NATHAN & DREYFUS

SELF OILERS.

These Oil Cups are too well known
to require any lengthy description;
the following are the main points
of advantage.

We guarantee a saving of

75 PER CENT OF OIL.

They are composed of a transpar-
ent Glass Cap, mounted in Brass,
provided with a hollow tube, inside
of which is placed a loose acting
solid or hollow wire, which acts as
a Feeder and Regulator. The wire
rests constantly upon the Journal,
thereby acting with the bearing in
its motion. The wire is so regu-
lated inside the tube as to feed ac-
cording to the demand only. There
is no flow of oil whatever while the
machinery is not in motion.

They are as reliable in Winter as in Summer.

Being a perfectly air tight vessel, the oil will never gum in them, as this has been proved by four years' con-
stant use.

They are constructed in a very neat and substantial manner.

We spare no pains in making them as perfect as it is possible for them to be made, and guarantee them to give
perfect and entire satisfaction.

DIRECTIONS.

Fill the Cup full of Oil, then screw the Cap down air tight. Place the tube in the oil hole in an upright position
or upon an angle of 45 degrees. Permit the Rod to rest upon the journal, and have a perfectly free action. If you
desire to have the oil flow faster, reduce the size of the wire.

Take Notice.

All persons are hereby cautioned against buying, selling or using any Cup with a wire resting upon the journal
that is not stamped with our name and date of patent, May 21st, 1867, as we shall prosecute all infringement, signed
NATHAN & DREYFUS, New York, Jan. 1st., 1871.

WE ARE ALSO GENERAL AGENTS FOR THE

GARDNER & ROBERTSON AUTOMATIC SAFETY STOP GOVERNOR.

After an experience of eleven years in the manufacture of the above Governor, during which time several im-
portant improvements have been made and two additional patents obtained
we feel justified in recommending it to all parties using Steam power, and
warranting it to be the most perfect
regulator in the market.

The Gardner Governor is so well
known that we think it unnecessary
to enter into a detailed explanation of
the principle involved, or details in its
construction, merely giving the leading
objects realized by this important in-
vention. The Governor combines with
the greatest simplicity of construc-
tion, accurate regulation of speed, pos-
itive insurance against all accidents
liable to occur from slipping or parting
the Governor or driving belts, and a
convenient arrangement for adjusting
the speed of the Engine while in mo-
tion, without change of pulleys.

The construction of the Governor is
extremely simple, having no springs,
inside joints, swivels or parts liable to
disarrangement, all the several parts
are duplicates of each other in the same
series; the most skillful workmen are
employed, the best material used and
the machinery employed especially
adapted to their manufacture. Thus

we warrant these Governors to give perfect regulation of speed under all circumstances, and we will cheer-
fully refund the money, after a trial if not satisfactory. We keep a large assortment on hand.

When ordering, be particular to say Governor with THROTTLE VALVE OR WITHOUT THROTTLE VALVE; and either
BLACK OR FINISHED, as you may require. We are also Agents for the

Nathan & Dreyfus Automatic Cylinder Lubricator.

In introducing this valuable Cup to the public, we desire to call very particular attention to its many special ad-
vantages.

FIRST—Notbing but clean oil or tallow is admitted into the Cylinder; no lime or sediment of any kind.

SECOND—Its great economy of both tallow and fuel.

THIRD—It is self-acting, and supplies the lubricating material only while the Engine is in motion.

FOURTH—Its certainty and regularity of feeding, and increase of the power of the Engine.

The principle upon which this apparatus is founded is that, instead of admitting tallow into the Cylinder in con-
siderable quantities at uncertain intervals by means of tallow cups, grease cups, and other crude contrivances, and
allowing it to be instantly blown out at the exhaust (as must necessarily be the case), this cup, by its peculiar
action, delivers the lubricant in drops into the body of the steam, which thereby becomes thoroughly impregnated
or gassed before passing into the steam chest or Cylinder; the consequence is that instead of falling to the bottom
of the Cylinder, as it does when admitted through a tallow cup (which passes the lubricant from the bottom of the
cup to the Cylinder), it enters into the form of minute globules, and hence the whole of the internal parts of the
engine become regularly and constantly greased. The result of its action has been proved in a very great number
of cases to be an enormous saving of tallow, a considerable increase in the power of the engine, a great saving in
fuel, and reduction of internal friction to a minimum.

These Lubricators will save you 75 per cent of the Lubricating Material, and cost
no more than the common Compression Cups.

The Above Goods are Sold at Factory Rates.

large quantities.

Are now Prepared to Take Orders
AND MAKE CONTRACTS.

This Company will manufacture Pipe and guarantee
it to stand any pressure required; it is lighter than iron
pipe and more durable, it is not affected by chemical
action, cannot corrode, and being glazed imparts no dis-
agreeable taste to water. To miners and farmers it is
invaluable; any body can put it down; it is twenty per
cent cheaper than iron pipe and ten times more durable.
For further particulars, apply at the office of the Com-
pany, Room No. 2, 645 Market street.
Circulars sent on application. 16v21-tf

**THE WILSON
Patent Steam Stamp Mill**

This extraordinary Mill, now so justly popular in the East, is now offered to the miners of the Pacific Coast. Having been in operation now for about two and a half years, the Company feel confident that the

WILSON STEAM STAMP MILL,
For Durability, Efficiency,
AND ECONOMY OF WORKING,
HAS NO EQUAL.

The Wilson Steam Stamp Mill is the only Steam Mill that has had the severe ordeal of practical working, and proved itself eminently successful. It is now in operation in several of the Eastern States and Territories, and gaining an enormous popularity. The whole machine is so simple as to be readily understood by the most ordinary minds. In fact, its simplicity is its durability. The expense of crushing rock or cement with this Mill is less than one-half the expense of any other Stamp Mill, and less than one-half the cost. For further particulars inquire of

FURMAN R. WILSON,
San Francisco.

Or of THE WILSON STEAM STAMP MILL CO., 325 Walnut street, Philadelphia, Pa.

NOTICE.—All persons are hereby warned not to manufacture or use any Steam Stamp Mills that are an infringement on the Wilson Patents, as they will be prosecuted to the utmost rigor of the law.

F. R. WILSON,

20v19-tf Supt. W. P. S. S. M. Co., Philadelphia.

TRAVIS & WAGNER!

AGENTS FOR

Dufour & Co's.,

Celebrated Dutch Anchor Brand Bolt- ing Cloths; Smit Machines; Bran Dusters; Mill Picks; Mill Picks dressed; Mill stones repaired, rebuilt and balanced.

MANUFACTURERS OF French Burr Mill Stones, Portable Mills of all sizes, from 16 to 36 inches, for grinding Corn, Barley, Feed, Salt, Paints, Drugs, &c. Mills specially adapted for grinding Quartz.

2v22-lyms 41 First st., San Francisco.

Varney's Patent Amalgamator.

These Machines Stand Unrivaled.

For rapidity pulverizing and amalgamating ores, they have no equal. No effort has been, or will be spared, to have them constructed in the most perfect manner, and of the great number now in operation, not one has ever required repairs. The constant and increasing demand for them is sufficient evidence of their merits. They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.

This Amalgamator Operates as Follows.

The pan being filled, the motion of the miller forces the pulp to the center, where it is drawn down through the aperture and between the grinding surfaces. Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly passing a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.

Settlers made on the same principle excel all others. They bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed.

Mill men are invited to examine these pans and settlers for themselves, at the office, 229 Fremont Street, San Francisco.

Gold Saving Amalgamated Plates.

ADAPTED

FOR

Smelting.

Foundry.

Mining

and

Steamships.

REQUIRES

Fifty Per Cent.

LESS POWER

Than any Blower

Now in use.

One of these Blowers may be seen on exhibition at W. T. Garratt's Brass Foundry, corner of Mission and Fremont street. They are also in use at the Almaden Quicksilver Mine; Gridley's Foundry, Gold Hill, Nevada; Etna Iron Works, San Francisco, and many other places.

CAUTION.—Purchasers will find it to their advantage to apply direct to the Stockton Agency, as certain parties, not authorized to manufacture the Blower, have put in the market machines of inferior construction, which do not answer all the requirement of the genuine article.

Quartz, Saw and Grist Mill Irons, Steam Engines, Horse Powers, High and Low Pressure Steam Engines, Steamboats and Propellers, made at short notice.

THE HESSE GRINDER AND AMALGAMATOR.

This machine is the most complete and desirable grinder and amalgamator now in use. Owners of Quartz Mills and Sulphuret Works will find it greatly to their interests to use this machine. The following are some of its many advantages, viz: The comparatively little power required to run it; the small wear of metal in comparison with other grinders; the large amount of work that may be accomplished in a given time, being about three times the amount usually performed in ordinary pans; the continuous working process, whereby the labor of handling the ore is avoided; the peculiar arrangements and action of the currents in the machine, whereby all the particles of ore are brought in contact with amalgamating surfaces, and are discharged as soon as ground to the required degree of fineness, thus saving an unnecessary waste of power and metal.

IN THE REDUCTION OF SULPHURET ORES,

this machine is especially valuable, the particles are ground exceedingly fine and uniformly sized, which greatly facilitates the concentration of the sulphurets, and leaves them in the best condition for roasting. The Hesse machines are successfully working in several important quartz mills and sulphuret works in this State. For further particulars send for Circular, or apply to

Lubricator for Steam Engines.

This valuable instrument consists of a vertical, cylindrical oil chamber, of glass or metal, provided with two openings at the top, through one of which the chamber is charged with oil, while through the other the oil is ejected by the fluid pressure brought to bear upon the lubricant. The oil chamber is also provided with two openings at the bottom, one for the discharge of water before filling, and the other for the introduction under the oil of water acted upon and impelled by the pressure within the steam boiler. All the openings into or out of the oil chamber are controlled by small screw valves, by means of which the injection of the lubricant is brought fully under control. The exit pipe is provided with an inverted syphon, to prevent steam from any chamber, into

which the oil is being fed, from entering the oil chamber. The induction pipe, through which the water is introduced, is provided with a vertical condensing pipe, for the purpose of providing, by condensation of steam therein, a full supply of pure water for use in expelling the lubricant from the oil chamber. The instrument is constructed on scientific principles and is beautifully and substantially made. It has been in use now more than a year and has given, we are told, the highest satisfaction to those engaged in steam engineering on this coast. It is manufactured by Mr. Wm. T. Garratt, corner of Mission and Fremont streets, S. F.

ORNITHOLOGICAL AND PISCATORIAL 'ACCOMMODATION SOCIETY OF CALIFORNIA.—This Society held a meeting Feb. 9th, 1871, in the rooms of the Academy of Sciences, No. 622 Clay Street. The following named gentlemen were elected officers for the ensuing year:—President, W. A. Newell, M. D.; Secretary, John Williamson Esq.; Treasurer, James Rolph Esq.

THE loss of life in the present European war is estimated to amount to half a million. Nearly four hundred thousand prisoners have been taken by the Germans.

Improvement in Vehicles.

Besides the blows which may be inflicted on horses by the drivers, there are other blows and shocks which the animals receive from the shafts of trucks when the front wheels, as usually placed, strike against obstructions on the road-bed. These blows, although their effect is somewhat deadened by the harness, are often much severer than a humane driver would willingly inflict.

To relieve the draft-animals from such blows and strains, and to gain certain other advantages, Messrs. Ross and Burk, of Truckee, have invented an improved construction of vehicles, applicable more particularly in the case of heavy trucks, which is here illustrated. The invention consists in so mounting the front part of the vehicle that it will ride upon one or two wheels, whose axle is supported in boxes

ROSS & BURK'S IMPROVED VEHICLE CONSTRUCTION.

on a horizontally-rotating rim; it also relates to the use of a device for relieving this horizontal rim from friction when turning from side to side.

The floor, A, of the truck, may be rounded or otherwise suitably formed at its front end, and has a circular opening made through it large enough to admit the rim or fifth-wheel, whose upper surface is flush with the top of the floor. At the lower edge of this rim is a flange, a, on which run the rollers, c, c, c, which support the front end of the truck. These rollers work in openings in an independent rim, E, which thus keeps them in position. They are conical or tapering in form, and consequently the rim or band which is attached to, and protects, the lower part of the floor, where the rollers come, is beveled. The upper part of the rim or fifth-wheel may be kept in place by buttons or lugs or by a flange, if desired.

Upon the rim, at each side, is secured a box, G, in which turn the journals of the axle of the front wheel, J; or, if found more desirable, the ends of the axle may be made fast and the wheel be allowed to turn upon it. The hub must be of sufficient length to insure steadiness and firmness in its attachment to the axle. The wheel, J, is made strong, with dodge-spokes and a broad, heavy tire, to prevent its sinking too deeply in soft spots or wearing too rapidly. The shafts are attached to the rim in a suitable manner. The seat is mounted

on springs and attached to a cover or housing, M, which protects the driver from the dirt thrown from the wheels. If it be found preferable in any case, instead of one wheel, J, two wheels may be employed, placed a short distance apart, so as to be within the rim.

By this arrangement, the object mentioned above would seem to be completely attained. Moreover, the truck or other vehicle can be easily turned in either direction; and the horse can be turned to one side, so as to be entirely out of the way, in cases where there is not sufficient room for him to stand in front of the track.

The inventors of this construction are Messrs. John D. Ross and Martin Kecer Burk, of Truckee, Cal., whose patent, obtained through the SCIENTIFIC PRESS Patent Agency, is dated December 20, 1870. Any letters concerning the invention may be addressed to the patentees.

Water Rights in the Mines.

Judge Sawyer, of the U. S. Circuit Court for California, Nevada and Oregon, has given an important decision in the case of the Cole Mining Company vs. the Virginia and Gold Hill Water Company, granting an injunction restraining the latter from using the water diverted from the Cole Company's tunnel. It appears that the Cole Company, in driving a mining tunnel, found and appropriated the water in question, several years ago. Recently the Water Company, under pretense of seeking ledges belonging to them, ran another tunnel below the one mentioned and thus diverted the water. The pretended ledges are not shown to exist, and the tunnel was run on the mining company's land. The Judge grants the injunction until the rights of the two parties are settled, the case coming up for judgment next month. He says in his decision:

"It may be, that in a mining country situated as this is, a court would not restrain a party from merely running a tunnel through his neighbor's ledge, far below the surface, in order to reach his own, when it could be done without material damage, and there is no appropriation of his neighbor's property involved in the proceeding. To do so might be to throw unreasonable obstacles in the way of carrying on great and highly important enterprises. But, however that may be, I know

of no principle that would justify the owner of one ledge or mine in absolutely destroying the mine or property of another, in order to conveniently reach his own. This would be a palpable violation of the maxim cited.

Water is a highly important element in conducting mining enterprises in California and Nevada, and it is very generally known that it is scarce in Virginia, and the supply of this indispensable necessity for domestic and other uses to the people of Virginia City is almost all, if not wholly, derived from mining tunnels. A stream of water, therefore, thus found in a tunnel excavated for mining purposes is often as valuable to the possessor as the mine itself; and to take away such a supply of water from one who has acquired a right to it, by means of a tunnel excavated by another party for the purpose of prospecting or working his own mine, is as clearly a violation of the maxim as the destruction of his neighbor's mine in the same mode."

Tension Wheel for Sewing Machines.

For the purpose of keeping the thread tightened sufficiently in operating a sewing machine, Mr. John H. Mooney, of this city, has invented a very ingenious con-

trivance, patented under date of May, 31st 1870, which is illustrated below. The following shows how it is operated:

The thread, passing from the spool through the guide over the wheel, is placed one and a half times around the wheel, between the two corrugated disks, and from thence is carried to the eye of the needle. The required tension is obtained by turning the thumb nut on the end of the stud, which presses the spring against the wheel, making it turn more or less easily as may be necessary. The friction on the thread is produced by its bending itself against the half circles made by the teeth or corrugations in the two flanges of the wheel; the teeth on one side being distant from those opposite a greater space than the diameter of the thread, it cannot bind or fasten itself, but will draw freely and evenly from the wheel.

The device operates, we are told, exceedingly well, and is now in use on the Florence machine. It can be applied to any sewing machine. It may be obtained of Mr. Samuel Hill (under the Grand Hotel, S. F.) or of any of his agents for the Florence on this coast.

We could probably give no illustration of greater importance to our lady readers than one relating to the sewing machine, an article which is most highly prized by those who possess one, and which is greatly longed for by those who are not the present owners of the very useful mechanism. Therefore the present illustration will be particularly interesting to the gentler sex.

MECHANICAL PROGRESS.

SEYFERTH'S PROCESS FOR SYRUP PURIFICATION.—The London *Artizan* describes the method devised by Dr. Seyferth for the neutralization of the acids in sugar making. We quote:—"The process consists essentially in the introduction of sulphurous acid in very weak aqueous solution into the vacuum pans. By this it is possible to bring all particles of the sugar solution into contact with sulphurous acid, and to eliminate, by the joint action of heat and vacuum, any excess of the acid, which, however, not only saturates free alkalies and carbonate of lime, but also sets the organic acids, which might be present as alkaline salts, free from these combinations; the sulphurous acid taking hold of the bases they were combined with, while the greater part of these organic acids are volatilized along with the steam, and thus the sulphurous acid promotes the crystallization of the sugar, while its action as a decolorizer comes also advantageously into play. The acid is manufactured at the works by burning sulphur in ovens, and carrying the products of combustion, previously cooled, into a leaden vessel wherein the gas is met by a current of water so as to become absorbed. The solution thus obtained is put into casks, or other suitable vessels, and from these a tube, provided with taps, leads to the vacuum pans, into which the liquid is sucked simultaneously with the sugar solution. The party in attendance upon the hoiling in the vacuum pans, takes care to test from time to time by blue litmus paper, so as to insure the contents of the pan remaining alkaline; but if by a mishap the acid is in excess this is remedied by sucking in a fresh quantity of sugar solution, while a slight increase of the rapidity of evaporation (the turning out of more cold water to the condensers) will rapidly eliminate and volatilize any excess of sulphurous acid."

ALLOYS OF TIN AND IRON.—The following is from the *Technologist* for February: "According to Karsten, pig-iron with one per cent. of tin, yields a somewhat cold-short wrought iron with about 0.19 per cent. of tin. Such iron, it is stated, works well under the hammer, but at a white heat, white vapors escape. With more tin, the iron in welding gave much waste and produced cold-short iron, with a fine, white and dull grain. For specific purposes, however, especially where great hardness is required, iron with a small amount of tin, not exceeding 0.3 per cent., seems to be well adapted. Sterling, in England, hardens the tops of rails with tin, and according to a report of the English Commission for testing iron in regard to its adaptability for railroad purposes, the best Dundee bar-iron, if alloyed with 0.22 per cent. of tin, supported, without breaking, a weight of 23.39 tons to the square inch. Adolph Ott, of this city, fused wrought iron with 0.5 per cent. of tin, and arrived at results similar to those of Karsten. Whilst at a welding heat, it worked very well, the smith stating that it was some of the toughest iron he had ever worked. The grain was found to be fine and steel-like, with strong luster and bright color."

THE BRONZE GUNS FAILED.—*Engineering* says that the three bronze 9-pounders taken for testing as samples of the lot recently cast at Woolwich, "all failed after about 200 rounds had been fired from each of them, large holes and deep fissures being developed in the bores. Probably the metal—which is that of some of our old bronze guns—suffered in remelting, the tin, which has to be added at each remelting, not properly amalgamating with the body of the metal, but collecting in small pockets. These would form soft spots on which the action of firing would soon tell. Guns of this metal, when made sufficiently hard to withstand friction and erosion, are too brittle to resist the shock of the explosion of the charge. On the other hand, if the metal be of sufficient degree of toughness, so as not to break, it will be too soft to withstand the action of the powder when fired. When smooth bores and round shot were the fashion, the percentage of defective castings in bronze guns was very high, whilst with rifled ordnance that percentage has greatly increased. With new metal these results are bad, but when old guns are remelted, it is infinitely worse."

ELECTRIC SIGNALS FOR BRAKEMEN.—This plan has been introduced upon one of the trains between Boston and Worcester. The *Gazette* of the last named city describes the apparatus as "consisting of an electro-magnetic telegraph extending through the entire train, and connecting with the cab of the locomotive. There is a battery of six cups, and an alarm-bell in the cab and in each car. There are two wires passing between the cars, covered with tarred twine. One end of the cable is securely fastened to the car, while at the other end is a copper link, which is placed on a sort of a spring-hammer on the other car. This link, when in its proper position, keeps the connection open. It is so arranged that, should a part of the train become detached, the link is pulled off; the circuit is broken, and the bell in the locomotive and on each car is kept ringing until the circuit is again closed. Besides automatically indicating the breaking of a train, the apparatus is useful in signalling between the engineer and his brakemen. Instead of blowing the whistle to notify them to apply or let off the brakes, the engineer simply touches a little knob that rings the bell on each car almost instantly. By this method the brakeman on the rear car is notified as surely as though on the first car, which is not the case by the present arrangement, for it frequently happens that the sound of the whistle does not reach the end of a long train. If there is trouble in any car the conductor or brakeman touches a little knob, the signal is given, the engineer and the other brakemen are warned, and the train is stopped."

TAPIOCA PAPER FOR PHOTOGRAPHERS.—This paper, for copying photographs by artificial light, is thus prepared: Two hundred grammes of tapioca are soaked for 2 days in an equal weight of water; 10 liters of water are added, and afterward, for every liter of liquid, 10 grammes iodide of potassium, 30 grammes chloride of potassium, 1 gramme bromide of potassium, are dissolved, and the whole hoiled for ten minutes, allowed to stand for a day, and decanted and filtered through fine linen. The paper is immersed in it 12 to 20 sheets at a time—or can be floated upon it—for 15 to 20 minutes; it is then hung up to dry in a dark room. If it has assumed a dark color, that is of no consequence, as it disappears in the silver bath. This is to be prepared in the proportion of 1:15, and for every ounce of nitrate of silver, 50 to 60 grains of citric acid are to be added. The developer is made of 50 grains of pyrogallie acid and 80 grains citric acid in 30 ounces of water. The time of exposure varies from 10 seconds to 25 minutes, according to the picture to be copied and the actinic force of the light. —*Jour. of Applied Chem.*

STEEL WELDING.—We have spoken of the Rothwell flux. Following is evidence of its value from the correspondence of the *Iron Age*:—"At the shops of the New York and New Haven Railroad Company, welds were made of the worst specimens of steel which the ingenuity of the foreman could produce. A bar of American Bessemer, apparently one of a lot which has exhausted the mechanical ability of the shop to work, was welded in several ways and broken cold, showing a clear fracture across the weld. At the works of the Spring Company, the welds of spring heads are made with borax, which is both costly and uncertain. Welds were made of these with the Rothwell process, at one-tenth the cost, which were equal in every respect to those of borax, and superior in that there was no imperfect work—no failure out of seventy-five—while with the borax the failures are frequent. At a tool company's works, high and low grade cast steels were welded in every form, burned to a sponge, and perfectly restored."

EXTERNALLY ADJUSTABLE PACKING FOR PISTONS.—We see described a newly patented arrangement by which the packing may be tightened at will by simply turning a nut at the outer end of the piston rod. A conical head is by this means pressed down into the cup shaped leather packing with which the piston is provided, or is partially withdrawn, as the case requires. The same device is applicable to syringes and pumps.

THE DOLOMITE LIGHT.—"A new use has arisen for this mineral as a substitute for lime in the calcium light. Small prismatic pencils are cut out of it, and exposed to the oxyhydrogen flame by which they are rendered white hot and give out powerful photographic rays. The material can be used for hours without exhibiting anything more than a slight indentation on the side which was exposed to the flame."

SCIENTIFIC PROGRESS.

ALL VERTEBRATES FROM A COMMON PROGENITOR.—"With respect to development, we can clearly understand, on the principle of variations supervening at a rather late embryonic period, and being inherited at a corresponding period, how it is that the embryos of wonderfully different forms should still retain, more or less perfectly, the structure of their common progenitor. No other explanation has ever been given of the marvellous fact that the embryo of a man, dog, seal, bat, reptile, etc., can at first hardly be distinguished from each other. In order to understand the existence of rudimentary organs, we have only to suppose that a former progenitor possessed the parts in question in a perfect state, and that under changed habits of life they became greatly reduced, either from simple disuse, or through the natural selection of those individuals which were least encumbered with a superfluous part, aided by the other means previously indicated. Thus we can understand how it has come to pass that man, and all other vertebrate animals, have been constructed on the same general model, why they pass through the same early stages of development, and why they retain certain rudiments in common. Consequently we ought frankly to admit their community of descent; to take any other view, is to admit that our own structure, and that of all the animals around us, is a mere snare laid to entrap our judgment. This conclusion is greatly strengthened, if we look to the members of the whole animal series, and consider the evidence derived from their affinities or classification, their geographical distribution, and geological succession. It is only our natural prejudice, and that arrogance which made our forefathers declare that they were descended from demigods, which lead us to demur to this conclusion. But the time will before long come when it will be thought wonderful that naturalists, who were well acquainted with the comparative structure and development of man and other mammals, should have believed that each was the work of a separate act of creation."—*Darwin.*

THE OHIO GAS WELLS.—A paper in the *American Chemist*, by Dr. Newberry, says that at one point, near the mouth of the Kokosing, the augur, on reaching the depth of 600 feet, struck into vertical crevices and sunk several feet without resistance; and from two crevices a volume of carburetted hydrogen issued which was unparalleled in all the oil explorations made in the country; the wells gave out salt water intermittently, throwing it to a height of over 100 feet. The gas of one of wells, lighted at the end of a pipe two inches in the clear set in the well head, produced a jet of flame 20 feet long and as large as a hog's head. By fixing a stop-cock in the pipe the gas was made to accumulate until, measured by a steam-gauge, the pressure amounted to 180 pounds to the square inch. The gas appears to be pure and the volume sufficient to light a large city.

COMPOUNDS OF GOLD.—The *Journal of Applied Chemistry* for February contains an article by Prof. Charles A. Joy on "The Chemistry of Gold," from which we quote: "M. Pratt, of Bordeaux, has published the results of extended researches into the properties and compounds of gold. He states that chemically pure gold can be prepared in the form of sponge; that there exists a liquid chloride superior to the per-chloride, and that salts can be made from the sub-oxides and bin-oxide. He succeeded in making a fluoride of gold from which he prepared fluorine in the form of a yellowish gas similar to chlorine. The preparation of spongy gold is accomplished by saturating a solution containing ten per cent. of chloride of gold with pulverized carbonate of potash, and for each equivalent of gold salt, he adds an equivalent of a saturated solution of the same carbonate; he then treats the filtered liquid with five equivalents of pulverized oxalic acid, added in small quantities at a time, and boils the liquid for ten minutes. The gold is reduced to the state of an extremely fine powder, and the grains agglomerate and form a spongy mass without metallic luster, but convertible by the hammer into solid ingots. M. Pratt has also prepared the carbonate of gold."

CAUSE OF THE INSET CURRENT AT GIBRALTAR.—At a late meeting of the Royal Geographical Society, Dr. Carpenter read a paper upon this subject, in which, after detailing the various unsatisfactory theories which have been propounded in explanation of this current, he suggested the following,—which we find in *Nature* for Jan. 19th: "The water of the Mediterranean has a uniform but limited excess of weight over that of the Atlantic—so limited as to do away altogether with the idea that there is an accumulation of salt in the Mediterranean. The excess of salt was found to be greater in the lower than in the upper stratum of water, and thus the excess of evaporation was produced. If there be two columns of water of equal density—one that of the Atlantic, the other that of the Mediterranean—an excess of evaporation lowers the height of the Mediterranean column. If the Atlantic column were of fresh water, just enough would flow in from it to restore the evaporated water. But it is salt water which actually flows in from the Atlantic, and therefore it produces an increase of pressure, which presses the Mediterranean water outward till the equilibrium is restored. This being restored, there is once more a reduction of the Mediterranean level by evaporation, and so on; and, therefore, a circulation is always going on between the waters of the Mediterranean and Atlantic. The only difficulty in receiving this explanation is that the water of the outward-flowing current must run uphill; but other examples, he stated, are known. The fact that such a circulation exists, he said, is now indisputable, recent experiments having satisfactorily determined the evidence of a westerly current underlying the surface easterly current. These currents are, therefore, only a portion of the general oceanic circulation, which causes a perpetual surface motion of warm water from the equator to the pole, and a counter under-current of cold water from the pole to the equator."

WHAT THE ECLIPSE HAS TAUGHT.—J. Norman Lockyer considers the great teaching of the late eclipse to be the additional evidence of the compound nature of the corona; it being partly a true solar appendage, and partly due to our own atmosphere. He writes from Venice to *Nature*. We copy the conclusion of his article from that journal for Jan. 19th,—omitting the names of observers which he has given here and there in parenthesis:—"From what has preceded, then, we seem justified in suggesting as working hypotheses the following, which, however, more accurate information may alter, and which I offer as suggestions only, *bien entendu*. 1. The Solar Chromosphere extends some 5' or 6' from the sun, its last layers consisting of cool hydrogen, and possibly a new element with a green line in its spectrum; which line, if it be identical with the auroral line as stated by Gould, may possibly be present in the higher regions of our own atmosphere. 2. Outside this stratum the rays, &c., are for the most part due partly to our own atmosphere, partly to our eyes, for their shape varies; they are seen by some at rest, by others in motion, and their spectrum is the same as that of the dark moon. 3. The white light of the chromosphere above the prominences, as seen in an eclipse, is due to its strong reflection of solar light, as shown by the polariscope observations. 4. The rosy tinge of the corona proper, that is of the region more than 5' or 6' from the sun, is due to our atmosphere containing light which comes from the higher and lower strata of the chromosphere."

THE MOUNT WASHINGTON OBSERVATORY.—*Silliman's Journal* for February says:—"Prof. C. H. Hitchcock, at Hanover, has telegraphic connection with the summit, and occasionally joins the observers. Gen. Myer, head of the 'Bureau of Telegrams and Reports for the Benefit of Commerce,' recently established by Congress, ordered the laying of the telegraphic wire to the summit, so that a daily statement of the observations might be sent to Washington and to the rest of the country. The house occupied by the observers is the depot of the Mt. Washington railroad. The party has two barometers, thermometers, a hydrometer, Robinson's self-registering anemometer, and an anemoscope. Three daily telegraphic reports are sent out, two to the Bureau of Telegrams at Washington, and one to the New England Associated Press, Boston."

CORRESPONDENCE.

Notes of Travel in Mariposa County.

[Written for the Press.]

Hornitos and Vicinity.

Hornitos is the first one of the villages in this county arrived at on the tour from Stockton (via Snelling,) to the celebrated Yosemite Falls, of which I will say something in a future article. Although the subject has apparently been written thread-bare, the one-hundredth part has never been told. Hornitos does not at present contain over 150 inhabitants, and is quite dull; the lack of rain to supply the miner with water, suspends, in a manner, all placer diggings, although the mountain ranchers in the vicinity are apparently satisfied, and quartz mining is being pushed lively, within a distance of a few miles. Craigh & Co. and G. Gagliardo & Co. are its principal merchants; and, what cannot be said of ninety out of a hundred mountain towns, it has a hotel, kept by Dr. McDougall, Esq., where a first-class meal can be had.

Some two miles north-east from here is situated the Washington quartz mine, now successfully working, and satisfying its proprietors. The Jenny Lind quartz mine, situated next adjoining, (or near by), is at present silent, for want of the necessary capital to develop it. It is owned by J. Koehler, of Hornitos, and consists of a well-defined ledge, at a depth of 60 feet; the vein is four feet thick. The main vein contains a rose-colored quartz, highly sulphureted; the casings are of a rotten quartz, containing black sulphurets; its picked rock will average as well as the Washington, for which \$130,000 was refused last fall. Mr. K. claims 1,000 feet of this lode.

Bear Valley and the Mariposa Estate.

Bear valley, situated on the Mariposa estate, is some ten miles distant from Hornitos, and twelve miles from Mariposa. It contains about 500 quiet, industrious inhabitants; quite a different state of society from what existed here a few years ago, when drunkenness and murder, knife and revolver reigned supreme; for in former years this was the haunt of nearly all the escaped convicts and desperadoes in the country. Its present state is in great part due to the present manager of the estate, Mr. Thos. Goodsell, who has weeded out nearly all of the fighting and desperate characters who infested it. The children, too, are gathered together (by their own consent, now) on Sundays by Mrs. J. H. Brumagim to be instructed in morals. Previously the streets on Sunday were one grand carnival of fighting and carousing. The Mariposa blacksmith, Hon. J. W. Wilcox, still wields his hammer here with as much satisfaction as though he had never figured politically. Mr. W. also runs a small machine shop and foundry, and manages to satisfy his customers in each of the above lines of the mechanic arts. J. H. Brumagim & Co. are the present proprietors of the Mariposa estate; and Thos. Goodsell, Esq., its general superintendent and manager. This estate, of which little or nothing has been written commendatory of late, and which is apparently without friends in this State, is owned by eastern capitalists, is being successfully managed at present and satisfying its proprietors by the billion receipts from three mills now running. It is about 18 miles in length, extending from the Benton mill, on the Merced river, to some three miles beyond Mariposa town, in an north-easterly direction.

The Princeton mill is now under repairs, and the probability is that a new one will soon be erected. The mill at Mariposa is also shut down for reasons best known to the managers. The company have 600 men at present employed, a large majority of them working by contract. The drillers (single hand) get 32 cents per foot, 3 cents decrease on former prices paid. A number of important experiments with giant powder, Nos. 1 and 2, mixed with other chemical ingredients in several different forms, have been tried here, I was informed, successfully, but I can learn no particulars.

As far as my observation goes, I think this estate is managed more judiciously than it ever was before. Its affairs are conducted with closed mouths, and perfect secrecy as regards its present or future. I must say, however, that I never was more cordially treated in my entire tour of this

State than by the management and attaches here. J. Dolan Esq., Superintendent of the Linda mine on the grant, at "Pine tree," has been steadily engaged here for nearly eight years.

Coulterville and Vicinity.

Coulterville, 13 miles from Bear Valley (by trail), is quite dull at this season of the year. It depends almost entirely for its support upon the Yosemite travel in summer. The mines surrounding it that are successfully working, are situated at such a distance that each mine has its own village, of some size, to furnish all the wants of those employed. This place is situated about eighty miles from Stockton, via Knights Ferry and Crimea House, and about 90 miles via Modesto and Snelling. It contains about 300 inhabitants, and is one of the principal thoroughfares through which tourists pass for Yosemite, (there being three routes). A new wagon road is in course of construction, and, I am informed, will be completed this summer. When done, tourists can go in wheeled vehicles to within some three miles of the Falls, which will be within seven and a half or eight miles of the hotels in the valley.

The Virginia quartz mine, owned by J. M. Aiken, of Coulterville, is situated on the mother lode of the California mines, and is distant two and a half miles south-east of Coulterville. It is covered by U. S. patent, and is well known to be one of the important ledges of the State. It is now in the market for want of heavier capital than that possessed by its present proprietor. It is 2,500 feet in length and the ledge is from four and a half to forty feet thick. There is plenty of wood and free water in the immediate vicinity. The hanging wall is stratified and shows free gold; the boulders are, I am informed, rich all through, having been thoroughly tested by tunneling and shafting. Capt. J. M. Aiken is also the possessor of one of the finest cabinets (not the largest) in the State. It consists of 400 different specimens of all the metals known, from all parts of the world, together with 150 bottles containing samples of different metals, chlorides, etc.

The Ferguson quartz mine is situated on the main fork of the Merced river, about 28 miles, a little south of east, from Coulterville, and within eight miles of the foot of the Yosemite valley. It is owned by E. Ferguson & Co., who claim 3,750 feet of a ledge, and are running an 8-stamp mill upon the same. Water is the motive power, and a plenty of it is running free to drive a thousand stamps. This mine has been in successful operation for 11 years, without levying an assessment. It is now paying a monthly dividend of \$4,000, besides laying aside a small surplus for contingent expenses. They are now working 20 men. The vein is from 1 to 8 feet thick, averaging 2½ feet. The average pay of the rock is now about \$41 per ton, and, strange to say, it has never before appeared in print. Their tunnel is in 1,100 feet on a level with the mill, to which the rock is easily taken by car. At the back of the tunnel they have sunk a shaft down 100 feet; at this point it is 800 feet from the surface.

Hite's Cove and Vicinity.

Several promising quartz mines in this vicinity are worthy of mention; but, in the absence of statistics, I can only give location and proprietorship. The Pedrigosa mine is situated on Bear Creek, and is owned by C. Bogan & Co., of Mariposa. The Flevana mine, situated about four miles from the above, formerly owned by F. Trobaeo, is considered an excellent mine and has a well-defined vein in sight. Old Hyman mine, situated on Whitlock's Creek, now lying idle, is considered an excellent paying mine if properly worked. Its temporary failure was due to having erected their mill at an impracticable distance from the mine. The Excellent mine, owned by Mr. J. R. Hite, in Hite's Cove, supports a population of 100 men and is worked upon a safe and paying basis. Following down the river is the old Goodman or Eclipse mine, owned by Peter Wyants, of San Francisco. This is at present paying large dividends and, I am informed, will compare favorably with the first mines in the country. From Tuolumne County in my next. L. P. MC.

THE PACIFIC FLE WORKS, No. 53 Beale St., the pioneer establishment of the coast, has recently changed hands. It will be seen by reference to our advertising columns that Messrs. Ross & Harvey are now in charge. We have so frequently called the attention of foundrymen, blacksmiths and others to the economy of having their old files re-cut, that further allusion to the subject is perhaps unnecessary.

Banner District, San Diego Co., Cal.

[Written for the Press.]

ENS. PRESS.—I send you three specimens of ore from this district. The two marked "Madden," are from a depth of 25 feet from the surface, enclosed in hard metamorphic slate. The vein is about 16 inches wide, the strike is west by north and east by south; the dip is south, or nearly so. The other specimen I call iron ore, is from near Viccita; depth from surface, 5 feet. I shall probably be able, at some other time, to send you specimens from the different ledges here. [We are obliged for the kind promise. The specimens, here spoken of, have not yet arrived. They will be described when received.—En. Press.]

The lodes in this district continue to improve on going down, and things in general look better every day. All that is wanted is capital to work the mines and put up proper machinery. McMechan's mill is running day and night, as is McKean's wooden mill. The last crushing of Redman, at McMechan's, gave \$50 per ton. Morans Coral gave at McKean's an average of \$45 per ton. The Madden averaged, by arastra, \$130 for the last two months. Chaperal is sinking. Geo. McKean is taking out good rock. Antelope is doing well, taking out about \$450 per week with one arastra.

As I take a great interest in the Press, I would willingly correspond, if you think it would be of any service to you to hear the news from this district. [We should be happy to receive such communications.—Ed.] S. D. M.

Julian City, Feb. 5, 1871.

Bull Run District, Nevada.

[Written for the Press.]

EDS. PRESS.—The weather has been much milder and pleasanter here this winter than it was last year. The lowest point reached at any time by the thermometer was 6 degrees below zero; last year it fell to 16 below. The snow does not exceed four feet in depth on the mountains, and regular communication has been kept up with Mountain City.

A number of companies have kept steadily at work. The Johnson company are taking out ore which ranges from \$100 to \$3,000 per ton. The ledge is four feet wide and has on each side a casing almost as smooth as glass. It is between the limestone and the slate. The Pacific Central is also taking out high grade rock. The Sacramento Tunnel Company is pushing on as fast as possible, and expects to strike three ledges—the Sacramento, Highland Queen, and Ogden—by next spring. The Monument Tunnel is progressing rapidly, is in 185 feet, and is the largest in this district. The McShane and Owings tunnels are both being driven. About 60 men are employed in the different mines. It is believed that over 2,000 tons of ore will be shipped to the Auburn Mill, at Reno, for reduction, next summer.

The Blue Jacket mine is reported to have been bonded to an English company for \$25 per foot, with 2,000 down as forfeiture.

BULL RUN MINER.

Bull Run, Jan. 30, 1871.

WATER FOR NAPA.—We understand (says the Napa Register) that a company composed of gentlemen of means, residents of San Francisco, has been formed for the purpose of supplying our city with fresh water. The preliminary surveys are being made for the route to bring the waters of Milliken cañon and some other streams east of this place, into the city, and it may be to extend their supply pipes to Vallejo.

OYSTERS BY THE ACRE.—There are 3,000 acres of oyster beds in Chesapeake Bay, yielding annually 25,000,000 bushels of oysters. In Baltimore upwards of \$10,000,000 are employed in the business of canning oysters.

Engineering Projects.

At the meeting of the N. Y. Society of Pract. Engineering, on January 18th, papers were read on the "Flotation of Vessels by Buoyant Docks," by Col. John E. Gowen, the American engineer who raised the sunken vessels in the harbor of Sebastopol, after the Crimean War; on "Floating War Torpedoes," by Mr. M. L. Callender; and on "Improved Systems of City Tramway Transit," by Prof. J. A. Whitney.

Raising Sunken Vessels.

Col. Gowen described at length the means used in lifting submerged vessels at Sevastopol. This was done by docks or caissons, fitted with internal water chambers, which, when filled, sunk the caissons to the requisite degree. They were then connected with the sunken bulks by chains passing under the latter, the water was pumped out of the chambers were immediately over the submerged vessels, and the caissons, being thus rendered buoyant, lifted the vessels. The whole were then towed shoreward, until the vessels grounded, when the operation was repeated until the hulks were finally beached.

Acting upon the experience thus gained, Col. Gowen proposes to construct similar buoyant docks or caissons, but more boat-like in shape, for lifting vessels above their normal water line and transporting them across bars at the mouths of rivers, the entrances of harbors, etc. Four of these, two on each side, would be used, supporting the vessel upon an iron cradle or frame between them. The use of such means to convey heavily freighted vessels over the bar at the mouth of the Mississippi, by enabling grain to be transported from the Western States direct to France, would divert the French imports (amounting to \$100,000,000 annually) from the Russian ports on the Black Sea to the centers of trade on the Mississippi.

Constructing and Operating Torpedoes.

Mr. Callender described a method of constructing and operating floating torpedoes designed for use against iron-clads. The cigar-shaped body of the torpedo is guided by a rudder, which may be worked by cords from a boat following at a suitable distance. In its underside, pointing forward and downward at an angle of about 45°, is a cylindrical percussion bomb, whose front connects by a chain with the front of the body. When this body strikes the hull, the bomb is thrown forcibly forward and downward, is caused by the chain to move in the arc of a circle and thus to strike the keel under and below the armor, the concussion causing it to explode.

City Tramways.

President Whitney described the system of improved city tramways devised by S. D. Tillman, Chairman of the Polytechnic Association of the American Institute. It is proposed to lay down, flush with the surface of ordinary pavements, lines of iron blocks or plates, cast in such form as to secure the greatest strength, with the least weight, and to secure the greatest stability upon a sand or concrete foundation. The blocks of each track should be connected together in such a way as to mutually sustain each other in a longitudinal direction, and of such contour on the upper surface as to insure a smooth running-way lengthwise for wheels, and at the same time sufficient hold, especially in a transverse direction, for the shoes or hoofs of draft animals.

That such tramways would prove of very great advantage, was claimed as evident, when the rates of traction upon different road surfaces are taken into consideration. A tractive power of 100 pounds continuously exerted will, on a smooth iron surface, like that of a common railway track or of the proposed tramway, draw 27,600 pounds; whereas experiment has shown that, on other roadway surfaces, its result will be about as follows: On a common gravel road, 15 cwt.; McAdam, 27 cwt.; Granite pavement, 31.5 cwt.; broken stone laid on rough stone pavements, 48 cwt.; wood pavement, about 55 cwt.; and on the very best stone pavement, in the neighborhood of 67 cwt.

MINING SUMMARY.

THE following information is gleaned mostly from journals published in the interior, in close proximity to the mines mentioned.

California.

ALPINE COUNTY.

NEXT WEEK.—*Chronicle*, Feb. 11th: The machinery of the Glohe Mill has been running in order to get everything adjusted. The settlers will be put in position immediately, so we may expect the works will commence operations next week.

ANOTHER MILL.—*Miner*, Feb. 11th: We have it on authority that the Directors of the Schenectady Co., Tarsbush Mine, have before them three plans of reduction works, by as many competent mining engineers, and that after deciding which is best, they will put up works at once. The mine is turning out better than at any previous time; some four thousand dollar ore having been found recently and a vast body of pay rock in sight.

AMADOR COUNTY.

RED HILL MINE.—*Dispatch*, Feb. 18th: During a recent visit to Volcano we learned that a number of new quartz mines were being opened, which afford flattering prospects. Prominent among them is the Red Hill mine, owned by Epling & Kimball, three miles above Volcano. The rock taken out thus far, will average fifteen dollars per ton; and it increases in richness as they go down. The Co. will have their mill ready to commence operations in a few days.

CALAVERAS COUNTY.

BIG "CHUNK."—*Chronicle*, Feb. 18th: On Sunday we were shown a chunk of amalgam, weighing 449 ounces, the result of thirteen days' run at the Palomo. Several hundred dollars in pieces, reserved as specimens, had also been taken out, which would have swelled the total to \$8,000. At the depth of 400 feet the ledge shows wider and richer than at any point above. The shaft has been retimbered and everything got in shape to work to the best advantage.

EL DORADO COUNTY.

THE SEASON.—*Placerville Democrat*, Feb. 18th: The dry winter is severely felt here. As yet there has been nothing done in the way of mining to amount to anything. The aspect of the clouds for the last two weeks, has been closely watched with anxious faces.

MARIPOSA COUNTY.

ITEMS.—*Gazette*, Feb. 17th: The Washington mine, near Hornitos has become more valuable than ever. There is now opened a stope of 120 feet in length, in vein from 5 to 15 feet wide and averaging \$15 per ton for the whole body. The extraction and delivery of the rock at the mill is stated to cost only \$2½ per ton. . . . We have heard flattering accounts of the Ferguson mine, but have no particulars.

MENDOCINO COUNTY.

GOLD.—The *Democrat* has the following: "Mr. Traber, near Coats' Mill, Little Lake, has discovered a vein of gold bearing quartz. We understand some of the rock has been assayed and was found to yield \$7.70 to the ton.—This was surface rock.

NEVADA COUNTY.

THE WATER SUPPLY.—*Transcript*, Feb. 19th: A large amount of water from the reservoirs of the South Yuba Canal Co. is carried to Dutch Flat, and the supply is in consequence still short in this locality. Claims at Blue Tent, Cement Hill and other places in Nevada township are still unworked, though the miners are all ready. In other places in the county the supply is nearly up to the demand.

OSTOMAH HILL.—Gentry & Co. are putting in their flume, having got the tunnel, upon which they have been working for three years, through. They expect to get ready for washing early next month.

ALTA HILL.—*Grass Valley Union*, Feb. 17th: The Altoona miners are in the gravel. They are down 150 feet, and have made some good pannings. Alta Co., No. 3, have an engine at work pumping water and hoisting day and night. The shaft is down 125 feet, and has reached pipe clay which is always just above the gravel deposit. The hard part of the sinking has been accomplished since the cement, just under the soil, has been passed. The shaft is 11 x 4 feet in the clear, and is in three compartments, two for tubs and one for the pump. The Alta No. 3, we believe, will bottom on an old river channel of great richness. The workings of Alta No. 2 in the past and the explorations of the Hope Co. show this. At the depth of 250 feet the channel will be struck, and by the 20th of March the shaft will be down.

The location covers ground which it will require years to work through a shaft. The water is heavy, but the machinery handles it easily. The Alta No. 4 Co. have commenced a shaft and have gone into the cement for some distance. Work is not being prosecuted on these claims at present. The same with Alta No. 5. The Hope people are pounding away on cement, and making openings under ground.

STRUCK IT RICH.—Same of 18th: Jeffrey & Co., in the Altoona claim on Alta Hill, struck the gravel yesterday in the bottom of their shaft. The shaft is 8 x 4 feet, and from the gravel taken from it, Mr. J. washed out \$50 in gold.

HOWARD HILL.—A recent crushing of 21 tons of rock from the Howard Hill mine (formerly the Lucky), yielded, net, \$400, a little over \$19 to the ton. This rock was from fresh croppings.

PLACER COUNTY.

CRESUS.—*Stars and Stripes*, Feb. 16th: We understand that the Greek Co., on the Cresus ledge, have for some time been taking out very rich rock, and now have 100 tons in transportation to Ophir for crushing. Several companies are at work on this ledge, under lease contracts made with Tabb and C. H. Mitchell, who hold a patent from the United States. The leases are for short terms, at the end of which all improvements revert to the Messrs. Mitchell.

RATTLESNAKE BAR.—The miners still suffer for want of a sufficient supply of water. On the North Fork ditch there are places which were formerly walled up that do not stand, but slide away and will require to be flumed.

PLUMAS COUNTY.

EUREKA.—*Quincy National*, Feb. 11th: We learn that the prospects of the Co. for the coming summer's run are very satisfactory. They have 27 men taking out rock, and will commence crushing about the 1st of April. The vein is 25 feet wide, and the rock will pay \$25 to \$30 per ton.

SACRAMENTO COUNTY.

RHODES' DIGGINGS.—*Folsom Telegraph*, Feb. 11th: Kinkead Johnson and Harthan, of Folsom, and Dr. Light, of Sacramento, have taken up a mining claim for prospecting the stratum of rich pay dirt believed to lie between the cement and bed rock. The surface diggings were extremely rich at Rhodes', and in early times pounds of gold were often taken out in an hour.

SHASTA COUNTY.

UPPER SACRAMENTO.—*Courier*, Feb. 18th: Mr. Southern reports a heavy deposit of snow on the mountains about Dog Creek, Snake Creek, and Hazel Creek, and says miners all have plenty of water, and that the snow ensures a good supply next summer. He brought down 36 ounces of gold dust. He contends that the Upper Sacramento and its tributaries embrace the best mining section of the county.

SIERRA COUNTY.

WOLF CREEK MINE.—*Democrat*, Feb. 16th: The Co., are sinking a shaft, and have attained a depth of one hundred feet. The ledge improves in size and richness as they go down. At the present time they have a ledge at the bottom of the shaft six feet wide and of surpassing richness. The rock shown us was from the bottom of this shaft.

NUGGET.—A nugget of gold weighing six ounces was taken out of the Union claims at Port Wine last week.

NICE TAKE.—*Messenger*, Feb. 18th.—Andy Bergin, an owner in the old "Buckeye," found a nugget this week, which weighs 175 ounces; it contains some quartz, but is thought by competent judges to have 125 ounces of gold. If so it is worth over \$2,000. We understand a chunk was found in the same ground last year, which was worth about \$1,000.

ITEMS.—Kanaka mine will soon resume operations under different management. . . . Keystone has fourteen hands taking out rock. No water is there as yet. . . . The new mill at the Sierra Buttes of 40 stamps works well. . . . The snow storm has placed plenty of snow upon the ridges, which is enough to make the hearts of the miners glad, for a short season. . . . The Primrose, formerly owned by Lamping and others, has gone into the hands of Falk & Co., San Francisco. The sale was private, but the sum paid must have been large.

SISKIYOU COUNTY.

GOOD PAY.—*Yreka Union*, Feb. 15th:—William James and partner took out of their claim on Little Humboldt, week before last, by means of a rocker, \$175; the week previous they took \$134; how much they took out last week we have not learned.

TRINITY COUNTY.

DUTTON'S CREEK.—*Journal*, Feb. 18th:—The claim of Dixon, Paulsen & Co., is working with one sluice head of water. Their hydraulic is rigged with galvanized

iron pipe and twenty feet of canvas hose. The hose is protected by rings from four to ten inches in width made of the same material as the pipe. The edges of the rings are turned up so as to not cut the canvas and to prevent them from slipping over one another. This plan requires only one thickness of canvas to one hundred and twenty feet pressure.

ITEMS.—H. E. Willey has struck good pay near North Fork. Willey & Schutze proposes to extend the McWhorter ditch to the new diggings. . . . Edgecomb & Martin are sluicing off the old Court House site. . . . H. C. Wilt recently sold his mining claim on Park's Bar to a Company of Chines.

TUOLUMNE COUNTY.

KINCAID FLAT MINING CO.—*Sonora Democrat*, 18th:—This Co., have run their tunnel through solid rock eleven hundred and thirty feet. Great interest is felt by our miners in this enterprise. If the deep ground which this tunnel will tap, will pay for the investment made in opening it, several similar projects will be immediately put in operation.

The Knox & Boyle mine at Poverty Hill is promising well. Two levels were commenced a fortnight since from which ore is now being taken out. One run reducing fifty tons has been made, which yielded twenty dollars per ton. The rock crushed was taken without selection.

The last nine and a half days' run at the Confidence mine produced \$17,000.

Nevada.

ELY DISTRICT.

BULLION.—*Record*, Feb. 12th: We have to record this week: \$83,920.72. Every week's shipment seems to be an increase over that of the week previous.

CREOLE MINE.—The shaft is being timbered, a whim is building, and everything about the mine will soon be in shape.

PROCHE CITY.—A letter from which the *Gold Hill News* of Feb. 15th gives an extract, says:—"The whole country for five miles around this place is taken up. If a man strikes a good prospect, some one will bounce him with an old title. Three days' work holds good for one year. The ledges are very rich, but the trouble is the scarcity of water and mills. There are only three mills, and they are twelve miles from this place—one of thirty stamps, one of ten, and one of five. There are 3,000 people in and about the town, but only two companies working successfully."

EUREKA DISTRICT.

DIVIDEND.—*Sentinel*, Feb. 18th: The Eureka Cons. Co. will pay \$1 per share. This first dividend is equivalent to 10 per cent. per annum on the stock. The Jackson Co. will no doubt soon declare a dividend. Phoenix will perhaps declare no dividend until their furnaces are running.

RICH.—The bullion of Ogden, Dunne & Co., for the week ending February 17th, averaged \$1,063 per ton.

MINERAL HILL.—Huher & Co.'s mill has been laid up for some time for repairs. It will start again 1st of March. A large quantity of ore has been shipped from the Big Sandy mine to Austin, the owners not being able to get it crushed here. It is estimated that there is now on the dumps and at the mill over 3,000 tons of ore. Before that can be worked with the present mill facilities more than four times as much more can be taken out. This camp would afford constant employment to one or two more mills. Work is prosecuted with vigor in the mines. At the bottom of the shaft in the Giant, they have a ledge over 23 feet wide, all good pay ore.

HUMBOLDT.

BUENA VISTA.—*Silver State*, Feb. 18th: Three mills are in full blast. The Stewart and Arizona are working ore from the Arizona mine. The Pioneer is working ore from the North Star. The Arizona Association are working 28 men, and extracting on an average 30 tons per day of mixed ore for milling and shipping. In the North Star there are but few men to work as the ore cannot be hauled, owing to snow drifts. On the Arizona range, the Potosi and Inskip mines are producing fine milling ore. There are other mines prospecting with a show of success.

CENTRAL DISTRICT.—From this district, 14 miles north of St. Mary's, on Humboldt River, we have received specimens of ore from Locomotive ledge, evidently rich in silver. Assays yield \$1,000 to \$1,500 per ton. The ledge is six feet wide. The owners, Clark & Brother, are taking out a large quantity for shipment.

STAR DISTRICT.—The Sheba mine continues to improve as progress is made in sinking on the ledge, which is now four feet wide. Average mineral, with some shipping ore. The De Sofo has at present a large body of mineral, considerable of

which is shipping ore.

In Bloody Cañon district there are two mines worked vigorously, and shipping a fair amount of ore.

BULLION.—The amount shipped from the Arizona mine, through Wells, Fargo & Co., since our last was 730 pounds, valued at \$9,123.

REESE RIVER.

EL DORADO SOUTH.—*Reveille*, Feb. 14th: A lot of 134 tons of ore from this mine has just been worked in the Manhattan mill in this city. The pulp assay was \$220.60. We learn that hereafter the ore will be worked at Belmont, where Mr. Canfield has built a first-class mill, now in operation. Another mill, we are told, is projected. The Cornish pump drained the mine in three bours. Messrs Leon & Co. have commenced the sinking of the incline, which will be carried to a depth of 500 feet.

WASHOE.

HALE AND NORCROSS.—*Enterprise*, Feb. 19th: The daily product is 225 tons, principally from the eighth level. They are opening a new stope 90 feet south of the shaft. The ore is of very fine quality. Breaking of main shaft at the upper works yesterday will cause three or four days' delay.

SAVAGE.—This mine is producing 130 tons per day, from all the levels of both the old and new mines. The north drift on ninth level has been run 300 feet towards the Gould & Curry line. Cross-cuts run from this to the west have reached the wall without finding ore. Cross-cuts are now being run to the east.

SIERRA NEVADA.—The mine is yielding as usual, and the mill is running to its full capacity. The Sacramento and Meredith is also on Sierra Nevada ore. There is a marked improvement in the ore from the Sacramento and Meredith, and the mill will shortly be started on ore from that mine.

OPHIR.—Work in the "up-rise" is progressing favorably.

DANEY.—The drift is 74 feet from the main shaft. The rock is much more favorable. The drift appears to be draining the old works, and the pumps are constantly worked to their full capacity.

VIRGINIA CONSOLIDATED.—The north-west drift from the main west drift in the direction of the Central mine is progressing. The water continues to increase.

OVERMAN.—The suit between the Overman and American is now being heard. It will occupy the greater part of this week. About the usual amount is being taken from the mine.

SUCCOR.—The mine is yielding well, and the mill is in constant operation, paying all expenses. They have an abundance of ore.

CROWN POINT.—The ore body in the raise from the 1,100-foot level looks well. The drift on the 1,000-foot level to connect with the raise has yet to be driven forty feet.

YELLOW JACKET.—This is yielding 135 tons per day, assaying \$60. The most of this is from the 800, 900 and 1,000-foot levels. A considerable amount of prospecting is being done.

SUTRO TUNNEL.—The Tunnel was in 1,828 feet yesterday. The ground had been changable for the past two weeks, but is working well at present. Some water is coming in.

HOPE.—This has become bankrupt. The mine was about \$80,000 in debt. Many miners have been thrown out of employment and many are out for back wages.

BUCKEYE.—About the usual ore is being taken from this mine, which is crushed at their mill on the river.

GOULD AND CURRY.—Yielding as usual from the upper levels. A good deal of prospecting is being done and spots of good ore are occasionally found.

CHOLLAR-POTOSI.—This mine yields the usual daily supply from the Belvidere section, and all the ore breasts are looking well.

THE YIELD.—The County Assessor's books show a mine yield, for the last quarter of 1870, of about \$2,500,000. The average rock was about \$27 per ton. The best average on the largest quantity was given by the Chollar-Potosi, which mine yielded the greatest amount of ore, and \$1,034,911 worth of bullion—a yield never equaled by any one mine on the Comstock ledge.

WHITE PINE.

REVIEW.—*News*, Feb. 11th: The discharge of nearly 100 men from the Ward Beecher, North Aurora, Earl and Eberhardt mines, is to be looked upon as evidence of prosperity. The reason is, the piles upon piles of ore upon the dumps and the immense quantities ready for hoisting. Every drift, chamber and level is choked with ore. The tramway

is the one thing needful and the prospect for its early completion is good. Material is constantly arriving. The splendid 60-stamp mill is completed. Nearly all of our prominent mines on the Hill, with the above exceptions, are in full blast; work is prosecuted with energy, and the season bids fair to be unusually prosperous. The base metal mines, although backward, for the reason that comparatively no facilities exist for disposing of the ores, will many of them commence active operations soon.

Same of 18th says the Monte Cristo will build a new mill of 20 stamps. Several mines are named, commencing with the Trench and Dominion on the north and ending with the Mike Grey on the south,—8,000 feet in all—either one of which can keep a 20-stamp mill running on \$100-ore. The Base Metal mines on the west side of White Pine mountain will start work as soon as there is a market for their ores; and a dozen mines on this side only wait the same thing. The tramway has been delayed by the bad weather; but it will now be completed in six weeks. Work will then be resumed with a heavy force on the Ward Beecher, Earl, Eberhardt and North Anzora.

ASSASSIN'S REPORT.—The figures show the value of ore worked during 1st quarter of 1870 to be \$310,003; 2d quarter, \$386,119; 3d quarter, \$41,953; 4th quarter, \$397,134. Total for the year, with estimate of ore worked and not reported, and amount base ore sold, \$2,278,656.

Arizona.

BRADSHAW.—Prescott *Miner*, Feb. 11th: We have been in the Territory since 1863; but we have never seen such a mining excitement as that over Bradshaw district silver mines. This town is almost emptied at present by the rush thither. The mines are just over the Sierra Prieta range, 35 or 40 miles south from Prescott, in a well-watered, heavily timbered region. Should they pan out half as well as is expected, a town will spring up there. A site has already been selected. The ore is the richest we have ever seen. Old Nevada miners are excited over it. The "Tiger" ledge crops out 20 feet above the surface, is 4 to 8 feet thick, and has been traced for nearly 3 miles.

WALKER DISTRICT.—Shelton has out ready for crushing, several tons of decomposed Vernou ore, and recently got as high as one hundred dollars to the pan. The tunnel is in 150 feet, on the ledge. Paystreak two feet thick. The Pointer and Grant lodes were being worked, and the ore will yield \$100 per ton. Placer miners making good wages with rockers.

HASSAYAMPA.—Work is prosecuted upon the Davis lode, and the placer miners are taking out gold by the ounce.

WALNUT GROVE.—Henry & Co. will commence crushing soon.

WICKENBURG.—A private letter states that the Vulture Co. were getting plenty of rich ore; that Geo. H. Wilson and others were at work on their extension claims, and intend to give the ten-stamp mill all the crushing it can do. Placer diggings had been discovered above Wickenburg, and Mexicans were rushing to them. As high as three dollars had been taken from one pan of gravel.

BIG BUG.—We learned on Thursday that a large body of very rich ore had been struck in the Eugenie mine. The mill was working. Owners and miners happy.

British Columbia

A Victoria telegram of Feb. 12th, says: The Legislature of British Columbia has passed a bill allowing the Lanc and Kurtz Cariboo Mining Company to import all mining machinery (of California manufacture) free of duties and road tolls.

Idaho.

ITEMS.—*Avalanche*, Feb. 11th: The Chariot mine is yielding 100 tons of ore per day. They are down 50 feet on the seventh level, making the depth of the shaft 550 feet. It is intended to sink 40 or 50 feet more and then stoppe out the seventh level. The January account foots up \$106,482 21, and \$44,500 worth of Chariot hulkion was shipped to San Francisco this week.... The Peck & Porter is now in splendid shape. A substantial engine house, ore house and blacksmith shop have been built. The shaft is 240 feet deep. At the bottom of the 70-foot level there is a tunnel 80 feet, running north, and at the bottom of the 160-foot, a tunnel 140 feet. The average width of the quartz throughout is two feet.... The Mahogany is still yielding rich ore, which is worked in the Webfoot mill. Since Peaby took charge he has made it pay the expenses of working, besides liquidating old indebtedness.... Boh Morrison is prospecting a ledge east of the Peck & Porter. He has a tunnel in

30 feet, showing a vein two feet in width. Ben. Cook has commenced work on a south extension of the Corduroy.

LOON CREEK.—Oro Grande Cor. of *Democrat*, Feb. 11th: The winter has been mild. Several parties have been engaged in mining constantly thus far. Mr. Wm. Boyd averaged \$5 per day with a rocker. Tunnels are being run both up and down the creek, and a party of miners have found good prospects on the head of Yankee Forks, 18 miles above Oro Grande. Reports of good diggings on Salmon river, below Robertson's bar, are received.

Mexico.

The Acapulco correspondent of the *Bulletin* writes, Feb. 8th: "The news from the interior is limited. The few papers which have come to hand extol the richness of the newly discovered placers in Chihuahua, the mines of Pachuca; but all this wealth only exists for a few lucky individuals."

Montana.

CABLE.—*New North West*, Feb. 10th: Mr. Cameron was in town on Wednesday with 640 ounces of gold bullion—value about \$11,000—the result of two weeks' run on Cable ore.

GREAT DITCH PROJECT.—The *Independent* of Feb. 11th, says that a canal 25 feet wide and 5 deep, has been surveyed from the Jefferson River, at a point near Silver Star, to Helena, 160 miles, for mining and irrigating purposes. It will open up an immense mining region and make thousands of acres fertile.

The Silver Star mill is running on Green-Campbell ore, with good results. Nathan Merryman's smelting works at Beavertown, are working ten tons of silver ore per day. The ore pays \$108 per ton, four-fifths of this clear profit.

NELSON HILL.—Cor. of same: This is four miles below Blackfoot. It was discovered in 1866. The mining was done by carting the dirt to water for washing, the miners making \$5 to \$20 per day to the hand. In 1869, Ashley and Rierson dug a small ditch from the Ohio Ditch, four miles, and diggings were found to pay \$10 to \$20 per day. Last summer Green and Pounds, of the Ohio Ditch, purchased the small ditch of Ashley & Co., and enlarged it to the capacity of 350 inches. Mr. Rierson has also a ditch completed from Ophir gulch to a line of rich bars southeast of Nelson Hill. Kimley & Martell have a ditch out of Ophir Gulch, with a capacity of 150 inches, and have good paying ground. Butler, Welley & Co. have been digging a ditch from Snow Shoe gulch to the low bars on the east side of Ophir gulch. It will have a capacity of 400 inches. The company contemplate a hed rock flume four feet wide and two feet deep, running up Ophir gulch. About two miles of the gulch and bars on either side can be worked through it. Two miles above, is the bed-rock flume of Smith & Co. This is three feet wide and two feet deep, and is now in good pay; the Co. have nearly 4,000 feet of ground yet to work. There will be employment for a large number of men here in the spring.

QUARTZ CREEK.—Cor. of *Missoula Pioneer*, Feb. 9th: On Spring Bar, drain-ditches are being run on several claims, and the boys are sanguine of reaching bedrock and big pay in about a month. The owners of upper discovery claim cleaned up last week \$47 from two sets of timbers in the gravel.

FOREST CITY.—Cor. of same: On Monday the water standing in claim No. 63 since the freshet, was tapped by a drain from 62. The water in 63 and 64 is now falling steadily. Work will probably be resumed next week.

BROWN'S GULCH.—Mr. Enselman, Supt. of the mill, is working over last years tailings and getting \$110 per ton. Mr. John How has a new mill, nearly ready to run, on the Pacific lode.

THE SNOW.—*Helena Gazette*, Feb. 13th: "In our opinion the present snow, with what we may expect yet, settles beyond dispute that we will have one of the most prosperous mining seasons in 1871 that the Territory has ever experienced."

Oregon.

Telegram, Portland, Feb. 18th:—Good gold diggings reported discovered in Tillamook County. Active operations will be commenced as soon as the spring opens.

BAKER CITY.—Cor. of *Dalles Mountain-er*, Feb. 3rd:—There is snow enough in the mountains to ensure water until the first of August for mining purposes.... Work on the Burnt River Ditch has been prosecuted with great energy since it passed into the hands of the Chicago company.

Mining Stocks.

SAN FRANCISCO, Thursday Eve., Feb. 23.

The mining share market has been subjected to very considerable fluctuations during the past week, the most prominent of which was the sudden rise, last Friday, of Gould & Curry from \$40 to \$60 and its subsequent decline. The fluctuations in several other descriptions were due in part to dividends paid or delinquent assessments added. Yesterday, the anniversary of Washington's birth-day, there was no session of the board.

The following table gives last Thursday's quotations compared with to-day's, and the highest and lowest points reached by the several descriptions of stock.

HISTORICAL RECORD.

(Copyrighted.)

History of our Country Towns.—No. I.

SNELLING,

MERCED COUNTY, CAL.

(Written for the Press by Mrs. FRANCES H. McDUGAL.)

The historic wealth of California is, as yet, for the most part, a hidden treasure. The hills, the mountains, the ravines, the gulches, the obliterated tracks of the wilderness and the thoroughfares of populous towns, all teem with stories of exciting and thrilling interest—tales of heroic achievements, unwritten records of silent suffering, amid all the anguish of disappointment, despair and death, when human hearts broke and gave no sign, leaving no pen to write their history, no tongue to tell their sorrows.

Could the lives of the pioneers be faithfully written, they would, even in their naked truth, rival the romances of the Thousand and One Nights, and eclipse the wildest exaggerations of eastern fable. But the miners themselves, are generally unwilling to recall the bitterness of past experience; and hence their unrecorded achievements are fast fading out from the mind of man.

It is to rescue those heroic men and women from oblivion, and give them their true place and honor on the pages of history, that these waifs of the mountain side, through highways and byways, will be gathered together; and may they continue to call forth the latent memories of individual experience, until all our sectional histories shall have been faithfully collected, and worthily written.

PIONEERS OF SNELLING.

In the year 1849 a few Sonorians and Americans commenced river mining, above and below the falls of the Merced. Among the Americans were L. P. Wilson, Major Harvey, Judge Bell, P. Ford, H. McDonald, Evans and Wade, (who built the first ferry), and some others, whose names are forgotten. Samuel J. Scott, John M. Montgomery and Dr. D. W. Lewis were the first actual settlers. They built the first camp in 1849; and in 1850 they put up a frame house, one and a half stories high, which was occupied by Dr. Lewis as an inn. In 1852 this property was sold to William Snelling. During the next year Mr. Snelling built a large two story house, with porticos and verandahs, above and below, which was opened as a hotel. The place was thence known as Snelling's Ranch; and from this point the town of Snelling took its rise and its name.

A DEADLY CONFLICT.

In the year 1858 an event occurred, which threw the infant settlement into a terrific excitement; and to this day it is remembered as one of those appalling scenes, which our early pioneers were too often called on to encounter. On the 23d of January, as a party of men in the bar-room of Mr. Snelling's were engaged in a game of crack-loo, the first scene of a fearful tragedy was enacted. One by one they tossed up a half dollar and the man whose throw fell farthest from a crack in the floor, was to pay for the liquor. A dispute in regard to the relative distances ensued, when Bill Edwards, a very desperate man, drew his pistol on William Snelling, Jr. and killed him instantly.

The murderer escaped; but by his own evil deeds was soon brought to justice. He killed a man for his money; and a Mexican woman who saw the act informed against him, when he was taken and hung without judge or jury.

Bad as his character and his cause were, he left behind some friends. The most conspicuous of these were Stevens, Barclay and Wilcox, while the Snelling party was marshalled by Charles Bludworth, then sheriff of the county, Benjamin White and Dr. Goodwin. Some time after the death of Snelling the two parties met opposite the Court House, when the subject of contention was brought up, and a sharp quarrel arose among them, when the fight and the firing became general and a universal panic ensued. The horrible truth was soon known and made public. Three men were killed—Stevens, Dr. Goodwin and Barclay. Immediately after, Wilcox, the only man left on Edwards' side, mounted his horse, rode away, and was never heard of afterwards. Charles Bludworth and his brother-in-law, Benjamin White, feeling that they had the right on their side, boldly stood their ground. The grand jury of this county found a bill against them. They were indicted, tried and honorably acquitted.

THE FIRST FLOOD.

This occurred in the latter part of 1851. Dr. Fitz Hugh, since one of the most distinguished citizens of Snelling, was then living at Mariposa Creek, near what is now known as Plainsburg; his being the only family for many miles around. From the 20th of December till the last of the month the waters spread over an area of at least thirty miles, making the whole country impassable for man or beast. At the commencement of the flood, the Dr., who had been out hunting stock, caught a view of his premises from a high hill 20 miles off. Perceiving the extreme peril of his family, he put spurs to his horse; and dashing through the fast rising flood, arrived home about dark, to the

great joy of all at finding each other safe. His house, which occupied a strip of higher land about 60 feet wide, now stood with one end dipping in the water, while the other was elevated only about six inches above it. The house, however, maintained its ground, throughout the whole siege of two long weeks, during which they had nothing to eat but unground barley bread, garnished by a squirrel, or a hawk, whenever they were so fortunate as to catch one. But the town of Snelling, being then yet in embryo, sustained no further damage, than the extensive caving of its banks and loss of land. The great event in its history was

THE SECOND FLOOD.

It should be remembered that the Merced river has its source five or six thousand feet above the level of the sea, while the town of Snelling, only sixty miles distant, is but a few hundred feet above the common sea level. This great fall, in so short a distance, must give an immense impetus to any sudden rise, or liberation of its floods. The early and continued fall of rain in the autumn and winter of 1861-2, with its dreadful results, will long be remembered by the citizens of the Merced, the San Joaquin and Sacramento valleys.

At this period the river had begun to be studded with tin farms, where large fields of grain, orchards and vineyards were cultivated. Many of the farmers were extensively engaged in stock raising; and on the first alarming rise of the water, there was a general effort made to save the animals that had been feeding on the intervals; and many parties were seen driving their cattle and other creatures to higher land. But the valleys were rapidly flooded with water; and after exhausting all their efforts, wet from head to foot, from morning till night, they sat down in the palsy calm of perfect helplessness, to await their fate.

In all directions, over the wide waste of

measure, for the floor was rising and their stout hearted old anchorage itself began to quake and quail. The hall swung round with a tremendous lurch, and strained on the rope. They then saw that the old and the new parts of the building were separating, when there was a general rush among the ladies for the small or old part, which seemed to be firmer; and the last who went over had to jump more than a yard over the widening gap.

They then thought they had found a place of safety, but soon perceived that that was moving too, and their next refuge was in the oak. Planks were laid from the dining hall to the body of the tree and the ladies, five in number, one of them, the landlady, with two little children and a babe in the arms, all reached the tree in safety. And for the rescue of these thirty-two persons, there were no means at hand but a light little pleasure boat, which Mr. Bludworth had built for his young wife, a delicate and fragile thing, fit only for

"Sunny smiles and summer skies."

The very sight of it, dashing amid the angry waves, called forth a cry of horror; but under the skillful management of Harden Perkins, they were all brought off, one at a time, the transit occupying more than five hours of the most agonizing anxiety and fear. The brave and generous Perkins never recovered from his almost superhuman efforts. He took the consumption and died within the year.

The next morning the hotel went off, leaving only its ground floors behind and they soon followed. About half a mile down, the house went to pieces and all its treasures were scattered to the waves. The next night the people stood on the shore, watching by moonlight the parting struggle of the stern old tree. After having broadened its arms, and bound its roots by the buffetings of unknown centuries, it could not get away from its hold, without some

the panic caused by the flood, when another shock came, which threatened the complete annihilation of poor, unhappy Snelling. On the 12th of September, 1862, a destructive fire broke out in the store of Mr. Goldsmith. Only three houses were left where shelter could be procured; and these were only saved by keeping wet blankets on a neighboring store, with the prompt exertions of the men, aided by one lady, who, though then in delicate health, carried twenty-two pails of water quite a distance; and thus the fire was at length subdued and a fragment of the town preserved.

But the irrepressible energies of the yankee nation were neither to be quenched with water nor consumed by fire. The town was soon rebuilt and began to increase with a steady and healthy growth. At present it contains about eighty families and 300 inhabitants, of whom 125 are Chinese. Within the last two years the population has nearly doubled; and still, from day to day, the sound of the saw and hammer through all our streets, gives a pleasant promise of future increase.

INDUSTRIAL OPERATIONS.

The beautiful valley of the Merced, with its rich alluvial soil naturally indicates the leading business of the people—that of agriculture. The whole valley, more than thirty miles in length, by about one mile in width, is occupied by fine farms, but is not yet cultivated to the full extent of its producing power. Wheat, hay, wool, butter and cheese are the chief staples; while all the edible roots and fruits are produced in great abundance and perfection. A very important branch of industry is general stock raising. The numerous groves of oak furnish food to large herds of swine, and the fine pastoral region west of the San Joaquin, "invites to sheep husbandry." The culture of the honey bee begins to receive some attention, and experiments are being made in the product of cotton, which, in these rich bottom lands, with so genial a climate, ought to thrive abundantly.

By the statistical report of the Surveyor General, we find that the county of Merced contains 90,000 acres of cultivated land, from which was produced in 1869, 450,000 bushels of wheat, 216,000 bushels of barley, 65,000 bushels of Indian corn, 2,080 bushels of beans, 8,250 bushels of potatoes, 2,800 bushels of sweet potatoes, 10,000 bushels of onions, 10,315 tons of hay, 11,500 pounds of butter, 1,800 pounds of cheese, 631,713 pounds of wool and 30,300 pounds of honey. There were at the same time 3,513 horses, 43,290 neat cattle, 122,083 sheep, 11,296 hogs and 1,142 bee hives; and the assessed value of property was \$1,106,806. It is proper to mention here that this county has discharged all her indebtedness and has now more money in her treasury than any of the neighboring counties. And this alone is a strong testimony for the business ability and integrity of her citizens.

MANUFACTURES.

At the Merced Falls, six miles above the town, a woolen factory was established in 1868, by a joint stock company, with a capital of \$100,000. There are twenty-four looms, with corresponding machinery sufficient to produce 800 yards of cloth a day. The wool is taken in the rough and all the processes of picking, washing, dyeing, carding, spinning and weaving are carried on, the work employing about forty persons. Blankets, flannels, water-proof and broadcloths, all of a superior quality, are among the products. All the machinery and everything is kept in perfect order, and the staple employed is genuine wool, and not ground rags as in some places.

Mr. W. N. Nelson established his flouring mill in 1854 which employs three persons and turns out 5,000 barrels of flour yearly. Mr. Murray's grist mill, which occupies a fine large building some distance below, was built in 1861; and judging from the capacity of the place, it should produce at least as much as its neighbor. The Snelling people may well be proud of these substantial and useful works.

MECHANICS AND MERCHANDISE.

Besides a full supply of ordinary mechanics, there are in Snelling a saddler's, a jeweller's and a tin shop, and a spirit of activity and industry prevails through the whole place. There are four stores for general merchandise and one drug store, a bank and a printing office, where a weekly paper is published. The San Joaquin Valley Argus is conducted with ability far above that of ordinary country papers, its columns being enriched by productions from the facile pen of Mrs. Steele, the gifted wife of the editor.

PUBLIC BUILDINGS.

The Court House, a handsome and substantial building, with a strong stone basement, was erected in 1857, at a cost of over \$8,000. The Odd Fellows Hall is also a fine brick building, and was completed during the last year and just now the finishing touches are being given to the Methodist Church, a small, but very neat brick building that will cost 3,400. The school house is really an ornament and honor to the place. It was built in 1867 and cost \$6,000. It stands a little way above the village and has two large and lofty rooms for primary and grammar classes, with all the modern improvements.

There are two first class hotels, Coulter's and the Galt House. The latter, kept by Mr. Anderson, is in every respect worthy of its long standing and high repute. Coulter's Hotel is owned by Mr. Wilson and in all its arrangements bears testimony to the large and liberal policy of that gentleman.

There are two divisions of the Sons of Ten-

THE SNELLING HOTEL AND THE "BRAVE OLD OAK"—DESTROYED BY FLOOD.

waters, horses, cattle, sheep and hogs, were seen struggling with the waves, or seeking a momentary refuge on floating fragments. The rise had been gradual, until the dam of the Benton Quartz Mills, on the Merced river, thirty miles above, suddenly gave way. This was a heavy structure of solid masonry; and when it broke, mountains of water rolled down the valley, with a thundering sound, overwhelming everything with heaving and heaping floods.

From the great breadth of the area covered, and the immense volume of water thus suddenly poured in, it had all the characters of a stormy and turbulent sea. In the maddening fury of opposing currents large logs and heavy timbers were dashed against each other or thrown up on their beam ends or tossed like straws amid the whirling eddies, while the white capped waves came roaring and surging on, with every sweep reaching still further inland. It was indeed an appalling scene. The strongest mind was overwhelmed with terror and the stoutest heart trembled.

The SNELLING HOTEL standing some three or four hundred yards from the river was the first to quail under the mighty shock. There had been misgivings in regard to its safety for several days and a number of the boarders had left on that account. On the 11th of January, 1862, their worst fears were confirmed. The evening previous there had been considerable excitement; and Mr. Hall, the landlord, was a good deal alarmed; but Mr. Kean Buchanan, the celebrated actor, who, with his troupe and family were at the house, said he knew all about floods, and felt sure that in the present case there was no danger. This tended to calm the excitement; but in the morning, on putting down a pole just outside of the porch, Mr. Hall discovered that the ground under the house was caving in.

At this time the ladies were all up stairs and on being called down took refuge in the dancing hall. A rope was passed through its windows, and made fast to the great oak near by. But this was soon seen to be an ineffectual

force, powerful as the upheaval of an earthquake. It trembled, as if touched by an ague, it shook, it tottered, and then, with one terrible sweep, it fell prone; and the pride of a thousand years was borne away to perish—but not to be forgotten; for that brave old oak shall be remembered and venerated by descendants yet unborn.

On the same day the house of Dr. Fitz Hugh, Judge of the County Court, was found to be moving, and was only saved by being taken to pieces; while his family had to make their way into town through the mud and water for nearly a mile. Mrs. Fitz Hugh was at this time in very delicate health, and a baby in her arms. Their beautiful grounds, with all their conveniences and adornments, were laid waste.

A PERILOUS POSITION.

During the night of the flood, L. P. Wilson, then living at the Falls, in company with Mr. Muggler, went with a skiff to rescue the family of Mr. Yizer and when in the current the boat struck a tree then standing in the water. Mr. Wilson caught a limb of the tree, when the boat drifted round and left him clinging to the tree, where he remained through the night. What an age of anxiety and suffering must have been condensed in that terrible and fearful experience. Twenty-two hours elapsed before he was taken off. He was finally rescued by Frank Hood and Dutch Charley, after a hard fight with the current for more than six hours.

SPONTANEOUS COMMONISM.

After this catastrophe everything was held in common; for as all egress was forbidden by the floods, there was, for more than six weeks, a great scarcity of provisions, as well as clothing and beds. The old school house was made, in part to do the duty of a hotel. The most generous spirit prevailed among the more fortunate ones and whatever they had was shared with the sufferers. If any one saw what he wanted, he took it without molestation. Nothing was sold.

THE GREAT FIRE.

But the measure of affliction was not yet full. Scarcely had the people begun to recover from

*This drawing is from a photograph view taken before the flood. Its structure is a fair representative of the roadside hotels in the interior districts.

perance, whose ranks are daily increasing, greatly to the detriment of the bars and whiskey shops, which are among the lingering fragments of the old barbarism. There are in the place five physicians, and lawyers enough, at least to keep business affairs comfortably awake.

EDUCATIONAL INTERESTS.

The first regular public school was taught by Mr. B. Frank Fowler, and commenced July 8th, 1861, the average number of pupils, during the first term being only eleven. In the course of two years the school, still under the care of Mr. Fowler, increased to an average of twenty-seven. From very low beginnings, numerical and mental, it has steadily advanced in capacity, intelligence and numbers, and will compare favorably with any school in the State, the pupils now being about 100, employing two teachers; Mr. Fowler yet retaining the place of principal. The present Board of Trustees, A. B. Anderson, P. D. Wigginton and J. M. Montgomery, deserve especial remembrance for their bold and liberal policy in forwarding the erection and establishment of the new school house, and their general patronage of educational interests.

THE DWELLINGS.

Of this place are generally neat and comfortable; and many of them are tasteful and elegant, with highly ornamented gardens and grounds. The palatial residences of Messrs. Scott and Montgomery, a little distance from the town, would be worthy of notice, even amid city splendors. The former occupies a commanding position on a beautiful mound, fringed with cottonwoods, and girdled with oaks of a most royal bearing. From the Observatory one of the loveliest landscape pictures ever yet seen will reward the climber. The valley of the Merced, with its beautiful bluff, dotting and dimpling, but nowhere broken, lies revealed, the whole enshroued by a horizon of unrivaled beauty. The distant foot hills, stretching eastward, mount into the Sierras, through openings of which can be seen lofty peaks, looking Heavenward, with their crowns of eternal snow, standing still, white and solemn, as the gates of another world.

CANCER.

Cancer, or more properly *Carcinoma*, is well known to be a malignant growth or tumor, which, unrestrained, tends to open ulceration, rapid destruction of tissue, and death of its unfortunate victim in comparatively a very short space of time.

The name cancer was originally applied to the scirrhus, or hard variety of malignant tumors, from the supposed resemblance which the turgid blood-vessels, which radiate from it, bear to the legs and claws of the crab.

Carcinoma, from the Greek noun *Karkinos*, an eating ulcer, is the name usually employed by surgeons, as it is alike applicable to all kinds of malignant ulcerating tumors, as well as canceroid ulcers or *Epithelioma*, the latter of which includes *lupus* and cancer of the lips and face. As the name cancer is popularly applied to all forms of *Carcinoma*, I will use it in its popular acceptance in this article.

Extensive Prevalence of Cancer.

Cancer prevails to a much greater extent than most people are led to suppose. In England, outside of the city of London, the deaths from cancer have been known to average 2,332 per year. Estimating London in the same ratio, the deaths from cancer in England alone, would amount to nearly 3,000 per year. As the prevalence of the malady does not seem to be determined by local influences, it is quite reasonable to suppose that the English statistics show a fair average. Such being the case, the total number of deaths annually from cancer would amount to more than 150,000.

The English statistics show that three-fourths of the cases are among females. This difference is due to the extraordinary frequency of cancer of the breast and of the reproductive organs. The disease may make its appearance in any organ or tissue of the body, in either sex, and at any period in life, yet it occurs most frequently between the ages of 40 and 55.

The Causes which Produce it

Are as yet undetermined; yet it has been found that only about one-third of the cases are traceable directly to a hereditary taint or diathesis, while no general cause can be found for the other two-thirds. It has been observed, however, that they more frequently follow local injury than any other exciting cause. A blow upon the breast has frequently been the starting point of its development in that location, and the irritation produced by a hot, filthy clay pipe has frequently had the effect to develop cancer of the lip. Chimney sweepers' cancer, too, is traceable to local

irritation as its starting point. The fact, however, that equally the same exciting local causes will produce it in some and not in others, indicates that all are not equally constitutionally predisposed to it.

The Premonitory Symptoms

Of cancer are so mild and painless that, unless the suspicions of the patient are aroused, no notice would be taken of it. When in the breast, the first noticeable symptom is a small hard lump, which seems to be moveable, deep in the body of the mammary gland; but it can be handled without producing any pain. As it increases in size, it seems to come near the surface, and finally becomes attached to the skin. At this stage the skin turns red or purple, with large, distended blood-vessels spread out over its surface. Sharp, shooting pains are now felt, but the tumor is not very sensitive when touched or handled. The axillary glands enlarge and are sore and painful, and the skin and complexion assume a dusky hue. Some of the nodules of the tumor now shoot out prominently and break, when the patient and friends are presented with the distressing spectacle of an open cancer.

Canceroid ulcers, embracing lupus and epithelial cancer, are slower in their growth, are always hard, either as a solid mass or around the edges; but when once open they certainly do, as the name indicates, eat like a wolf.

The presence of cancer in the stomach, liver, or any other internal organ is not so easily determined as when it involves an organ which can be seen and felt. Its fatal tendency, however, is the same in all cases.

The Treatment of Cancer

Is both medical and surgical, together with proper sanitary regulations. The mind should be kept in as composed a state as possible, a good nourishing diet should be afforded with plenty of out-door exercise, when such is possible, but without fatigue. In the early stages of the disease it is certainly true that it has been cured by careful medical treatment, as experience and numerous well-authenticated cases go to show; therefore, when its invasion is once known or suspected, its treatment cannot be commenced too early. These remarks apply to all cases, whether they admit of either medical or surgical treatment. The only cases which admit of successful surgical treatment are, of course, those which are situated in external organs and tissues of the body. As a rule, while it is in the form of a tumor, and is concealed beneath and not attached to the skin, and the skin which covers it looks and feels natural and healthy, its medical treatment, under the direction of a skillful physician, should be diligently pursued, and no surgical interference should be for a moment thought of; but if the hard tumor becomes attached to the skin, or the skin over the tumor has become red or purple, with twinging, darting pains, or the tumor has already broken open and discharges a thin fluid, it is then high time to begin its surgical treatment. For this purpose there are two methods, to wit: the knife and the cancer paste. Of these, some prefer one and some the other. The use of the knife is much the quickest, yet as a radical eradicator the paste certainly deserves a preference.

When extirpation by the knife is resorted to, it is always recommended to go largely into the healthy surrounding tissues in order to include every root and branch of the malignant growth, for if a single cell or the least remnant of the tumor is left behind, a new growth is sure to spring up from it.

The paste, on the contrary, attacks only the morbid growth, and destroys it root and branch, while the surrounding tissues are left in a sound and healthy state, ready to take on a healthy healing process.

E. J. FRASER, M. D.

San Francisco, Feb. 13, 1871.

WHEAT SHIPMENTS.—During the past season 36 vessels have loaded with wheat at Vallejo, taking in 872,075 cents. During the same period 14 have loaded at Oakland, with 263,151 cents, and 58 in San Francisco, with 2,054,030 cents. There are no grain ships at present under charter to load for Europe.

"MAMMOTH EGGS."—The *Alta* speaks of a hen's egg received at that office, measuring 8½ by 6½ inches in circumference. George W. Thompson, of the stone quarry ranch, has presented us one of equal size, and says his pullets makes an every-day affair of such productions. One of his brood recently over-did the thing by laying a much larger egg, and soon winged to her eternal roosting place.

POPULAR LECTURES.

Chemistry and its Applications.

[Prof. EZRA S. CARR before the MECHANIC ARTS COLLEGE, Mechanics' Institute Hall, S. F. Reported expressly for the Press.]

The Chemistry of Common Things.

LECT. I. Feb. 18.—It is not my purpose, said the lecturer, to give a series of scientific lectures, but merely to treat scientific subjects in a practical and popular manner. I propose to talk now of common things, concerning which we ought to know much, but concerning which, as I have found by an experience of teaching during a thirty of a century, the majority of persons supposed to be educated, know little or nothing.

One of the most common things we know of, is the air we breathe. It is most fortunate, most providential, that those things which are necessary to our existence, are everywhere. This is the case with air; it exists everywhere, and without it there could be no life. Without it the temperature would be subject to great variations, for it acts as a mantle around the earth to prevent these. Without it there would be no morning or evening twilight. It is the medium of social, moral and intellectual intercourse, the medium of sound. Our bodies are made up of it, and to it nearly all plants are conveyed after death.

The atmosphere is made up of a variety of things, but I wish now to direct your attention to two of these principally,—to the two elements, oxygen and nitrogen. And first we will consider oxygen, which, potentially at least, is the atmosphere. This is

The most Common Thing in the World,

the most abundant. Direct observation has shown that it makes up more than one-half of the entire world. It constitutes eight-ninths of the ocean and one-fifth of the atmosphere. Three-fourths of all animals, four-fifths of all vegetables, and one-half of all mineral matter (of which the crust of the earth consists) is oxygen. So abundant is it that not only is there sufficient to unite with almost all bodies (and oxygen has the very strongest tendency to enter into combinations), but there is also an excess of it in the atmosphere in an uncombined, free state.

We can obtain oxygen in a number of ways. The best and easiest for purposes of the laboratory is to separate it from certain solid bodies. I have here a very common substance, chlorate of potash, which you can get at any drug-store, and over one-third of which is oxygen. If I mix this and black oxide of manganese in a glass tube, and heat the mixture, oxygen is set free as a gas, as is indicated by the brightness with which a spark glows when inserted into the tube. If I mix the same substance with charcoal and touch a lighted match to it, I get a very energetic combustion.

These experiments indicate another point,—that all combustion is merely the combination of oxygen with solid bodies. I introduce a piece of wood, the end of which is glowing into this jar of oxygen. The wood blazes out into a flame. I light this piece of phosphorus and put it into the jar. The phosphorus burns with an intense light. I introduce into another jar, full of oxygen, this steel watch spring, one end of which I heat previously by igniting a piece of sulphur which is placed there. The iron burns brilliantly, throwing out sparks in every direction.

There is no element in Nature which has so strong an affinity for other bodies as oxygen. It unites so readily with magnesium, for instance, that this metal will take it in quantity from the air and burn brilliantly. The combustion of fuel is but its union with oxygen. Oxygen is thus a source of power greater than any other. It is the source of power in heat and light. It is the cause of the decay of animal and vegetable substances; if we wish to stop this decay, we can do so by excluding atmospheric air. Oxygen is taken into our lungs, by breathing, and when traversing every part of our bodies, as is effected by the circulation of the blood, it meets and unites with certain bodies, burns them, and thus keep up the temperature of the body which is necessary for existence. Every vital movement, the motion of a muscle, the action of the brain, is connected with this union of oxygen with other elements.

Another Common Thing—Nitrogen.

Another common element, with which oxygen is often associated, is nitrogen. The following table shows the composition of the atmosphere, nearly four-fifths of

which is nitrogen. The first column gives the names of the constituents, the second their percentage, and the third their respective amounts:

Oxygen.....	20.61	1,233,010,000,000,000 tons.
Nitrogen.....	77.05	3,994,393,000,000,000 "
Carbonic Acid....	.04	5,287,000,000,000 "
Aqueous Vapor....	1.40	54,460,000,000,000 "
	100.00	5,287,350,000,000,000 "

Nitrogen is a gaseous body, colorless, transparent, tasteless and odorless. The same may be said of oxygen. That these bodies should have these properties is a wonderful provision of Providence. As we are constantly inhaling them, if they had taste, our nerves of taste would be constantly used, and therefore would become irritated and deranged, and the whole system would be thrown out of order. A similar effect would follow if they affected the sense of smell.

If we burn phosphorus under an inverted jar placed over a water bath (so as to prevent fresh air from entering), the phosphorus will take up nearly all the oxygen of the air and we shall have left principally nitrogen. Now if we insert a lighted taper into a vessel of nitrogen, the flame will be extinguished. If we make further experiments, we shall find that nitrogen exhibits none of the activity of oxygen, but is mostly indifferent and inert.

Oxygen has a powerful effect in destroying organic bodies, and if it were alone in the air, it would act much more energetically than it now does. The processes of combustion and decay would be very rapid, all the processes of life would go on with great energy. If we put a small animal in an atmosphere of oxygen gas, it dies in a short time from the great stimulation of all the vital functions. Hence it is very important to have the oxygen of the air diluted in, and modified by, an inert element like nitrogen.

Consumption of Oxygen.

An adult person consumes between one and two pounds of oxygen daily. If we reckon the population of the world at a billion, and allow one pound per day to each person, and calculate approximately the amounts consumed in other ways, we may take the daily consumption of this element to be about as follows:

Man.....	1,000,000,000 lbs.
Animals.....	2,000,000,000 lbs.
Combustion.....	1,000,000,000 lbs.
Decay.....	4,000,000,000 lbs.
	8,000,000,000 lbs.
	= 3,571,428 tons.

Now, if the daily consumption of oxygen should continue the same, it would apparently take 945,098 years for all the oxygen of the atmosphere to be consumed,—not destroyed but locked up. But we cannot reduce the amount of oxygen except in a very small degree, say four or five per cent., without endangering the life of the higher order of animals. Hence it would take but a short time to render the existence of man impossible on the earth, if there were no means provided for restoring this oxygen to the air.

But there are operations going on which effect this. The rain and aqueous vapors absorb the poisonous carbonic acid, which is one of the chief products of combustion, removing it from the air and carrying it to the plants which feed on it, under the powerful influence of the sunlight, retaining the carbon and giving back the oxygen. We need have no fears then that our supply of oxygen will fail us. Far from it. Time was, in old geological history, when the air abounded in the poisonous carbonic acid to such an amount that no animal life could be sustained on the earth, when no animals existed, in fact. But the first life was of plants, and these purified the air until animals could live.

We see then what a tremendous power oxygen has. We can make no movement of muscle or brain without its uniting with other bodies. Its union with metals, in the battery, gives force enabling us to communicate (by means of the telegraph wire) with distant parts of the world. Its union with fuel gives us heat and motion, warms our houses and drives our engines. Without it we could not carry on the ordinary operations of life, nor even support existence.

QUICKSILVER.—The Nevada papers state that a ledge of quicksilver has been found about 18 miles from Nevada city. The ledge is 30 feet wide. The Santa Cruz Times reports that the development of the Santa Cruz Quicksilver Company are going on steadily; buildings are in course of construction and their tunneling is being pushed forward rapidly.

THE BOISE VALLEY QUICKSILVER ASSOCIATION are doing a good work. According to the Boise City News, of the 14th inst., they had already imported and refined about 138 tons of their valleys, and other local sources of silver.

Notices to Correspondents.

A. J. C.—Inyo County. Your letter is in type, but as the engraver has been unable to make the engraving, on account of press of business, it must be deferred another week.

BANNER.—Communication received. In regard to the books, a letter has been written to you.

THE RAIN, which commenced in this city on Monday, was the heaviest of the season, amounting to over two inches. The storm was general throughout the State and has proved most satisfactory everywhere. The result cannot fail to give much elasticity to business, since it affords a very fair guarantee for good crops of wheat, wool and gold. The rains for the present year, though still very light in the aggregate, should be counted more than they actually measure, from the fact that they have fallen under much more favorable circumstances than usual.

GOLD IN ALAMEDA.—Early in February-gold was reported discovered in Amador valley, Alameda county, about ten miles from Haywood. A district has been formed, the "Dougherty Mining District," and laws made. A claim is 50x100 feet. No rich strikes are reported, but several persons are said to be earning \$ to \$6 per day.

THE STORM hit of the 20th, was one of the most accompanied by the play, which in this city. into Ne- e in sev- er an fall, 'er-e

Desilverization of Lead by Zinc.

Very soon after Pattinson invented his process of separating lead and silver, Alexander Parkes, of England, patented his process (in 1851) of effecting the separation by means of zinc. He found that zinc, when melted with argentiferous lead, combines with the silver and, rising to the surface of the metal bath, forms a crust which can be removed, leaving in the lead but a very small amount of silver and a little zinc. His process consists, in brief, in melting the lead in a kettle, adding zinc, stirring the mixture thoroughly, then allowing the zinc to rise to the surface when it was removed. The lead, as it contained too much zinc for mercantile purposes, was run into a reverberatory furnace and there kept at a moderate heat until the zinc was oxidized, when it was tapped off, leaving the oxide. The zinc scum, which, besides silver, contained considerable lead, was heated in a kettle with a perforated bottom, so that the lead was melted and run off, and then further heated to oxidize the zinc, which was then removed by hydrochloric or sulphuric acid. A modification of this was, after liquating the lead, to heat the zinc alloy in small clay pots, distilling off the zinc.

Although this process apparently offered several advantages over the Pattinson method, yielding more silver and demanding much less labor, etc., yet on account of practical difficulties experienced in separating the desilverized lead from the zinc, and in treating the rich zinc mixture, it never came into extensive use, until in 1866, Prussian smelters again took up the matter and experimented extensively. These experiments gave so promising results that the method, with modifications, came to be largely practiced.

The principal modifications were in the manner of separating the poor lead from the zinc in it, and in the treatment of the zinc scum. One of the first plans tried, for the first point, was to chloridize the zinc, and drive it off by volatilization. For this purpose the desilverized lead was heated to a high temperature and stirred up with chloride of lead, with salt, with a mixture of sulphate of lead and salt, with the salts from the manufactories at the Stassfurth salt works (these containing alkaline chlorides and, more especially, chloride of magnesium), or with several other chlorine compounds. Another plan was to pass the lead through a shaft furnace with a flux rich in silica, whereby the zinc was partly volatilized and partly taken up by the slag. A third method was to oxidize in a refining furnace, a rather unsuccessful method, or by using oxidizing agents, as soda, nitre, or super-heated steam. During an extensive trip among the mines and furnaces of the Harz and the Rhine provinces, we saw the several modifications of the two first plans mentioned, and were given very satisfactory results.

For separating the rich mixture of zinc, silver and lead, various methods were also tried. In all of them the lead is first liquated. The next step was varied in different places. One way was to pass the remaining mixture through a shaft furnace, which process gave a very rich lead, which was then cupelled. Another was to melt in reverberatory furnaces with lead matte and slag, or with litharge, whereby also rich lead for cupellation was obtained. Still another was by treatment with acids.

All of the methods found supporters, and favorable statistics were given in each case. But it appears that all have since given way in favor of those of M. Cordurie, of France. As the subject is one of the highest importance to lead smelters, we give a short summary of the Cordurie process. It is taken from a very interesting pamphlet which we have just received from Mr. Frederick Prime, Jr., the able Professor of Metallurgy and Mineralogy at Lafayette College, Easton, Pa. We refer our readers who desire fuller particulars to the pamphlet itself, which is reprinted from the *Technologist*.

The process may be divided into: 1st. Desilverization of the lead. 2nd. Refining the desilverized lead; 3d. Treatment of the scum.

1st.—About 22,000 lbs. of lead are put in a kettle and melted. The zinc is introduced into the metal near the bottom of the kettle, being placed in a perforated box to the end of a revolving shaft, and attached to the shaft by wings, which by their revolution distribute a distribution of the rising zinc. After the zinc has been mixed with the lead, the mixture is removed. It is found necessary after each addition of zinc

to stir for some time with ladles, an operation which possibly might be dispensed with, were the wings larger and more numerous. The amount of zinc used is 1.1 per cent.; the length of time necessary for melting and ladling out, 20 to 24 hours. The amount of silver left in the lead is 79 grains to the ton. The original amount is, at Havre, 0.04 to 0.06 per cent.; at the Hartz works, about 0.01 per cent. The zinc scum, after being freed from lead by liquation in small kettles at quite a high temperature, holds 2½ to 3 per cent. of silver.

2nd.—The desilverized lead is put in kettles, holding about 11,000 lbs. each, which are heated to a light cherry-red heat; hoods are put on and superheated steam injected near the bottom of the kettle under a pressure of four atmospheres. In about three hours the whole of the zinc is oxidized and is skimmed off. The production of refined lead, of very good quality, is 80 to 84 per cent.

The cost of these two processes at Havre, where the workmen earn from 80 to 100 cents daily, is 9½ cents per cwt. for wages, coal and zinc; in the Hartz, 12½ cts. The loss of lead is said to be not over 1 per cent; there is no loss of silver, according to fire-assay, but, on the contrary, a slight increase. The necessity of using a high pressure is not apparent, from the Hartz experiments, or even of super-heating the team.

The oxides formed by refining are washed on an incline plane. Thus, globules of lead are obtained, which are refined; also lead oxide; and finally a mass composed of equal parts of zinc oxide and lead oxide. These last are again treated in ways, which we have no space to describe here.

3rd.—The rich zinc scum is liquated, and the lead therefrom goes back to the first kettle. The residue is again treated with steam (an important feature of the process) whereby the alloy of lead, zinc and silver is decomposed, giving rich lead (which is cupelled) and rich oxides of zinc and of lead.

At Havre, where hydrochloric acid costs only half a cent per lb., the oxides are treated as follows: They are separated from the intermingled grains, consisting principally of a refractory lead-silver-copper alloy and some metallic lead, by sifting under water. They are then treated with hydrochloric acid, which forms soluble chloride of zinc, which is thrown away. The residue is melted in iron kettles, giving rich lead (cupelled) and slags of chloride of lead. The last are reduced with lime and coal in a furnace, the resulting lead cupelled and the slag re-smelted. The lead from this smelting is refined and sold as antimonial lead.

In the Hartz, where acid is more costly, the oxides are introduced into the cupelling furnace, during the operation of cupelling.

A series of excursions in Germany, during a period of three years, convinced Prof. Prime that, of all methods of zinc desilverization, Cordurie's is the best and most economical. With local modifications, he thinks it is suitable wherever the price of zinc is not exorbitant. At the upper Hartz, the treatment of 1,653,440 lbs. lead, containing 2,770 lbs. 11 oz. silver, gave a loss of 29,303 lbs. lead, and a gain of 4 lbs. 1 oz. silver over the fire assay. The total cost of treatment (except superintendents pay) amounted to 23 cents per 110 lbs.

There seem to be many advantages over the Pattinson process. It is much cheaper, there is a less loss of metal, only a quarter as many laborers are required, etc., etc. It would appear that the process might be introduced into the United States, with, of course, the modifications required by the price of acid, fuel, wages, and other local conditions.

THE MCGARRAHAN CLAIM.—The managers of this job seem to have some wonderful facilities in manipulating politicians. Defeated in the courts of law, denounced by an upright Cabinet officer and the honest Commissioner of the Land office, they have been able to oust the two latter and to get the House of Representatives to override the decisions of the former. There now remains to be seen what they can do with the Senate and then with President Grant. Their success so far in carrying through a declared fraud is ominous. Our belief in human justice, as exemplified in the highest departments of our government, will be sadly jarred if they finally succeed. We still trust that the Senate or the President will put a stop to the scandalous proceedings.

PATENTS & INVENTIONS.

Full List of U. S. Patents Issued to Pacific Coast Inventors.

(FROM OFFICIAL REPORTS TO DEWEY & CO., U. S. AND FOREIGN PATENT AGENTS, AND PUBLISHERS OF THE SCIENTIFIC PRESS.)

- FOR THE WEEK ENDING FEBRUARY 7, 1871.**
SHOES FOR THRASHERS.—Dennis W. Hollihan, San Francisco, Cal.
HYDRAULIC TURNPIPE.—Samuel Adams, Michigan Bluff, Cal.
APPARATUS FOR CLEANING SULPHURETS AND OTHER ORES.—Charles C. Coleman, San Francisco, Cal.
BOOT-JACK.—Ezra Coleman, San Francisco, Cal.
EXPLOSIVE COMPOUND.—Joseph Hafenegger, San Francisco, Cal.
CAM FOR QUARTZ MILLS.—Oliver P. Hart, Logtown, Cal.
PEN-HOLDER.—Henry Roth, Virginia City, Nevada.
WHEEL FOR WHEELBARROWS.—George Withington, Ione City, Cal.
DEVICE FOR SAVING GOLD AMALGAM AND QUICKSILVER.—Oliver H. Young and Daniel J. Vaughn, Wisconsin Hill, Cal.

NOTE.—Copies of U. S. and Foreign Patents furnished by DEWEY & CO., in the shortest time possible (by telegraph or otherwise) at the lowest rates. All patent business for Pacific coast inventors transacted with greater security and in much less time than by any other agency.

Notices of Recent Patents.

GANG PLOW.—J. Harris, S. F. Mr. Harris has sought to construct a plow in such a way as to insure the greatest reduction of cost, and at the same time secure the greatest ease in operating and regulating it. He uses a single beam wide enough to receive the attachment of the two plows, or else two beams, if desired, to form a frame in the usual manner. The forward end of the beam rests directly upon the axle, and to its front end is secured the pole. The axle is straight and mounted upon the hearing wheels; and a projecting plate or standard is fixed upon it at each side of the frame. When the plows are depressed, so as to enter the ground, the beam hears on the axle between the standards, which then stand at an angle pointing towards the rear of the beam. Upon the inside of each standard, and above the axle, is secured a friction roller, which serves as a cam to raise the frame and plows when the axle is revolved, this being effected by means of a suitable lever properly attached to the axle or to the standard, as most convenient. A metal guard piece has its two opposite ends secured to the underside of the beam, on each side of the axle, being bent so as to enclose the axle and keep it in place under the beam, when the axle is turned and the plows are being raised. The beam is tilted to one side by means of a screw, by setting which properly the plows can be made to work upon a level when one of the wheels is running in the furrow and the other on the unplowed ground. By this construction, it is claimed, gang plows can be constructed at a small expense, and yet work as well as, while being more durable than, the more complicated forms.

GUN-LOCK.—E. B. Hendee, S. F. This invention relates to a very simple, effective and safe gun-lock, which will be more convenient than the locks ordinarily used. It consists of but three main pieces and a link, and is attached to the gun on the underside and inside the guard piece. There is also a cap or cover for protecting the lock from the weather and to guard against the possibility of accidents. By the construction, a number of advantages are claimed, some of which are as follows: The necessity of cutting away, and thus greatly weakening, the stock of the gun is avoided. The hammer is removed from its usual position, where it is apt to interfere with the accuracy of the sight by drawing the attention of the gunner at the moment it is expected to fall. The position of the cap prevents any possibility of pieces of it striking the eye. The number of pieces in the lock is reduced, and consequent simplicity and durability are obtained, and the parts are easily cleaned. The cover affords especial protection from weather and accidents. The hammer can be brought to a full cock while the gun is at an aim, and thus be fired very rapidly, especially when provided with a self-loading device. The lock can be applied to arms of all descriptions.

A New Roasting Furnace.

For the purpose of obtaining a furnace which will effect a thorough roasting of the ore, and a condensation of the valuable substances carried off with the fumes, while at the same time the cost of building will be reduced to a minimum, Messrs. Gerrish and Hinkle, of this city, have invented the construction which is illustrated below.

Fig. 1 shows a vertical section of the furnace, and Fig. 2 an end view; Figs. 3 and 4 show horizontal sections through the two parts of the furnace, at Mand P. Here A denotes the hopper in which the unroasted ore is placed. In this hopper revolves a shaft, on which are attached horizontal arms, by means of which the ore is stirred up and prevented from clogging. From this hopper the ore falls upon a cone (of iron or other suitable material) with grooved sides, which revolves and thereby feeds the ore in a steady stream or sheet into the shaft, S.

This shaft rises to a height of about 40 feet from the ground, is circular, or rather conical, in shape, and consists of an iron casing lined with brick. At its lower end is a partition, C, of the size and shape indicated, placed just above the openings, O, which divides the shaft into two flues, so to speak. The object of this is to regulate the currents of hot vapors rising from the fires, and to enable one to obtain a greater heat at the upper portion of the shaft.

The ore falls down the shaft, where it is subjected to the action of the heat rising from the fireplaces, into a space below. On each side of this space, and near its upper portion, is a fire-place, N, N, (see Figs. 2 and 3) communicating with the space through, O, O. This space has a sloping floor (which is incorrectly given as horizontal in Fig. 1) so that the roasted ore will slide into the chamber, H. By means of the partition, U, and the door shown in Fig. 1, the space below the shaft can be entirely shut off from the chamber, H, when desired. This door is raised or lowered by means of a chain passing over a pulley and weighted, as denoted in Fig. 1.

In the floor of the chamber, H, are two openings, L, L, through which the roasted ore can be let into cars, K, for transportation to any required point. These openings are generally closed by plates hung on a central shaft. The chamber, H, is provided with a door, M, and a valve, V, in the top, the last being opened for the escape of vapors when the cars are being loaded. In order not to interfere with the process, while the ore is being removed from H, the door below V is closed. At other times it remains open, permitting the roasted ore to fall continuously into the chamber.

The fumes, etc., from the shaft, S, pass through the flue, F, into the condensing shaft, R. At a suitable point, E, (shown at the junction of S and F), is an auxiliary fire-place (for effecting the more perfect roasting of the fine ore carried through the flue) which is given in side-section in the small figure at the right of Fig. 2. This is provided with a damper for any possible contingencies.

At the top of the condensing shaft, R, is a reservoir, T, from which water is permitted to fall through the shaft in the form of spray, regulating and aiding the draft, while it condenses the condensible portion of the fumes. The water, etc., falls to the bottom of the shaft and escapes out through P into the tank, J. The non-condensable vapors are carried off through the flue, I. The arrows show the direction of the currents. D denotes openings by which one can get at the flue, F, in order to clean it out, an operation shown in Fig. 1, and rendered necessary, as considerable matter will accumulate in the flue.

By this construction, it is claimed, the ore can be thoroughly roasted, while many

advantages are gained over other furnaces. The roasted ore can be removed without exposing the workmen to the dangerous vapors or requiring much manual labor. The draft is maintained and regulated, and all valuable metals are condensed from the fumes.

A very important point claimed is the cheapness of construction and the dura-

Orange Culture.

The success that has attended the occasional and mostly fancy cultivation of the orange in various parts of the central portions of the State, has suggested the possibility of its cultivation for profit in many of those localities. Experience seems to shew that oranges may be successfully

A "BOUQUET" OF CALIFORNIA ORANGES.

bility of the apparatus. Rough estimates place the cost of the furnace at four or five thousand dollars, although this matter has not been definitely decided upon as yet. The whole arrangement can be brought within a small area of surface, the large and costly condensing chambers being en-

raised as far north as Marysville. The oranges grown upon the Vallejo place, this last season, large quantities of which have been sold in this city, were pronounced very superior in quality. They were large, delicate, juicy, of fine flavor, and commanded a good price and ready sale.

THE GERRISH & HINKLE ROASTING FURNACE.

tirely dispensed with. The inventors, G. M. Gerrish and Philip Hinkle, assure us that their plans have been passed on favorably by a number of persons well skilled in the theory and practice of roasting operations. Steps have

been taken to secure their rights through the SCIENTIFIC PRESS Patent Agency. Those desirous of learning further particulars may address Gerrish, Hearst & Co., 14 Hayward's Building, S. F. The details of construction etc. may also be seen at the Union Foundry, First street, where a furnace is being built.

Heretofore the greater portion of the oranges raised in our State have been produced in the vicinity of Los Angeles, where this fruit certainly thrives in great perfection. As an evidence of the thriftiness of the orange trees there we have had an engraving made, as annexed, of a branch, plucked a few days since from a tree in the garden belonging to Mr. Paul Kern, and standing within the limits of the city of Los Angeles. It was brought to this city by Mr. D. McLaren, photographed by Bradley & Rulofson, and afterwards placed on exhibition at the Odd Fellow's Library where it was examined by great numbers of our citizens.

This branch is about two feet long, and something less than an inch in diameter, where it was taken from the tree. It contained, when taken off, 75 oranges, five having dropped off after they were matured,

but before the branch was removed from the tree. Thirty-seven, only, are seen in the engraving, the balance being concealed by the foliage, or fruit in front. When looking up directly underneath the branch, the eye rests upon a perfect mass of fruit, much as it would appear if packed in a basket. We doubt if a more prolific growth could be produced in any part of the world.

The tree from which the branch was taken is about 13 years old, and bore in all about 2,000 oranges.

Academy of Sciences.

At the regular meeting, last Monday, a large number of contributions were received, among them a large collection of European plants, specimens of various woods, and a specimen of the fiber of the Mexican Maguey plant, which fiber is used in the manufacture of twine, rope and textile fabrics.

Professor Bolander said that he had seen in a newspaper a statement that parties were making arrangements to cut peat in the San Joaquin valley, and inquired if any real peat was known to exist in California. He expressed the opinion that the geological and climatic conditions of the State were not favorable to the formation of peat. This substance is formed by the decay of vegetable matter constantly under water. Where the vegetable matter was subject to overflows, as was the case along the San Joaquin river, earthy matter must be deposited, which would prevent the formation of real peat.

Dr. Gibbons stated some observations he had made regarding the rain in this State. He said that in the Eastern States the rain begins in the quarter from which the cloud comes, while upon the coast the rain begins to fall first in the quarter toward which the cloud is being blown.

At the next meeting, Prof. Davidson will give an account of observations made in Europe of the late eclipse.

QUARTZ MILLS IN MONTANA. We published in our issue of Jan. 7th, a table of the quartz mills on the coast from the Pacific Directory, which, we said, was probably as correct as could be obtained in any publication. The reputation of the work is such that the Commissioner of Mining Statistics does not hesitate to use it, as he tells us. We still believe that our general opinion of the Directory is right, although we cannot always endorse the exact figures. But we are always glad to be corrected when in error, and give the following from the *New North West*, which says that our table for Montana was wrong. The paper does not give any statistics in return, and it is just on this account that it is so difficult to get the exact figure. It says:

We believe that in Deer Lodge county, during the year 1870, up to October 1st, there was only one mill, of 15 stamps—the Cable City, Hanauer mill—at any time in operation. Since then the James Stuart mill, of Philipsburgh, has been started up by Capt. Plaisted. Madison County had not, we think, more than five or six mills in operation during the year, and all the Counties are over estimated. Mr. Langley has not revised his Directory of Montana, and it does not give the "correct" statistics in this respect. While wishing there were 43 quartz mills pounding away in Montana, it is prejudicial to the territory to have that number published and the few that are in operation have their yield accredited to such a multitude.

OREGON COAL.—The *Statesman* of Feb. 3d, says Frank Cooper is down from his coal bank at the head of Butte creek, and we learn from him that he is now running into a ledge of excellent coal ten feet thick, which improves as he goes in. Mr. Burrows has tried 1,500 pounds of this coal, and certifies that it produces gas well, but doesn't yield coke as well as could be desired. Cooper says that this coal bed is 280 feet above the creek, and slopes upward in the hill, which makes drainage without cost. He has been making lime and cement in a lime quarry near by, as a source of revenue, and with the proceeds has been prospecting the coal beds near by. There is also iron of the best quality near by, the ore being very rich and in immense supply.

HOUSEHOLD READING.

Making Cake.

[Written for the Press.]

"Come here, Helen," said Mattie, "Aunt Lucy is going to show us how to make cake." "O, Auntie, will you, really," said the little sedate Helen, "Well, I for one, am very glad; for your cakes are always so light and nice, that when we go to picnics or surprise parties, every one that knows anything about your cooking asks for some of your cakes, and some one is sure to ask me how they are made—especially, your jelly cake."

"Well, girls," said Auntie, "as you have come to stay the afternoon, we will make a jelly cake for tea; or you may make it, and I will show you how; for you will find it a good plan to be able to do such things yourselves, if you want them well done. Then, if you ever have servants to manage, you will not find yourselves entirely at their mercy. I have had some experience in that way, which I will relate to you some other time; but now we will make our cake."

First, take two cups, even full of white sugar; pour it on the mixing board, roll it fine—there, you see that is better; there will be no hard lumps in your cake to make it heavy. Put your sugar in the mixing pan; now get four eggs, select the large ones, break the yolks in the sugar and turn the whites on that platter. Helen, you may take a knife and beat the whites to a stiff froth; and you, Mattie, may take that spoon and stir the sugar and yolks together. Now I will sift two cups of flour, then take one heaping teaspoonful of baking powder and rub it into the flour with my hands; now put one fourth of a cup of water on the sugar, then the flour; now for flavoring, we will put in a little extract of lemon. Now Helen, if your eggs are beaten enough, we will stir them in, very carefully—there, our cake is made, and now we will butter the round pie tins; about ten I think will do. Spread the dough very thin; be careful not to bake too hard, if you do, the jelly will not stay on nicely or look as well. Here, Helen, you spread the cakes.

Mattie, bring that last cake from the oven. There, now you see how it is done. It has taken more time to show you than to have made it myself; but I am glad you want to learn, and as you grow up, you can become useful as well as fashionable.

I am going to bake bread to-morrow, and I will show you how I make my yeast. First, I take three good sized potatoes, peel and wash them, then grate into a small pan, then add one tablespoonful of sugar and one of salt. Now stand the pan on the stove, and pour one quart of boiling water on the mixture; stirring quickly all the time. Now remove from the fire, when nearly cold; stir in a cup of baker's yeast, and as soon as it rises it is ready for use, and will keep good for two weeks, in cool weather. By saving a little of this to start with, you can keep good yeast all the time. I think you must be tired by this time, girls, and I see your uncle coming to supper; so we will try your cake. You can also take some home and show your mother your first baking. Good evening girls." "Good bye, Auntie; we are coming again, next week, if it will be agreeable to you."

L. L. B.

"Your ticket, sir," said a conductor to a gentleman who, having been a season ticket-holder for some time, believed his face was so well known that there was no need for him to show his ticket. "My face is my ticket," replied the gentleman, a little annoyed. "Tudeed!" said the conductor, rolling back his wristband and displaying a most powerful fist, "well my orders are to punch all tickets passing on to this platform."

OVERTAKING THE BRAIN.—A meeting has been held in Charlestown, Mass., to consider the subject of overtaking children's brains by the present method of education. Such meetings should be more general. It is a crying evil, and, it is to be feared, a growing one.

It is strange the only chapter in the Bible written by a woman (the mother of King Lemuel) contains a plea for woman's wages: "Give her the fruit of her hands and let her own works praise her in the gates."

Domestic Receipts.

MULLED WINE.—Boil together one tumbler of water, half a nutmeg, a small stick of cinnamon, a dozen cloves slightly bruised, the same of allspice; reduce it by boiling half; strain the spiced water into a pint of good sherry or Madeira wine. Set it on the fire, and when it begins to bubble, take it off the fire; sweeten with loaf sugar and serve. Cider may be mulled in the same way.

WINE WHEY.—One pint of boiling milk, a tumblerful of good Madeira wine; boil until the curds form. Pour off the whey into a pitcher; sweeten and serve. Cider may be used instead of wine.

TO MAKE SAUCE TO POUR OVER BOILED FOWLS OR MEAT.—One pint of fresh sweet milk; stir to it slowly a pint of boiling water; rub two heaped teaspoonfuls of butter; two even teaspoonfuls of flour; put this to the milk. Stew it until of the consistency of cream, shaking the stew-pan frequently. Season with salt and the juice of a lemon. If a whiter sauce is preferred, use more milk. If it is preferred to have it colored, beat up the yolks of two eggs; pour the sauce to them slowly, beating and stirring rapidly. Put the stew-pan on the stove long enough to take off the raw taste of the egg; one or two minutes will suffice. Pour a part of the sauce over the meat as a veil; season the rest, in any way liked, and send in a tureen.

BIRDS FOR CONVALESCENTS.—Lay them upon the gridiron; broil until a light brown color; then put them in a stewpan; pour over hot water enough to cover them. Let them stew until tender. Season with a little fresh butter, pepper and salt. Chicken, birds, and squirrels, stewed in a double kettle, are very delicate for invalids. If permitted, stuff the fowls and birds with minced oysters.

DOUGHNUTS.—Take seven cups of bread dough, when light mix, into it one and a half cups of melted lard, with one of sugar and a teaspoonful of soda—when it has again become light, roll it out; cut it into what shapes you please, and boil in hot lard. To succeed best, the dough should be mixed with milk.

HOW TO COOK CABBAGE.—After taking off the outside leaves, quarter the cabbage and wash each quarter separately in water rather more than tepid—as water of this temperature makes insects drop out. After rinsing in cold water, boil in plenty of salted water in which a little soda has been dissolved. Boil a little over an hour.

HOW TO COOK BEETS.—Beets should be carefully washed, but not cut before boiling, as cutting then allows the juice to escape, leaving them white and hard. In summer boil them an hour in salted water, and in winter boil them four hours. After boiling, scrape off their skins, and cut off the threads hanging from them.

Mechanical Hints.

WASHING FOR ROOFS AND BUILDINGS.—Slake lime in a close box to prevent the escape of steam, and when slaked, pass it through a sieve. To every six quarts of this lime, add one quart of rock salt and one gallon of water. After this boil and skim clean. To every five gallons of this, add, by slow degrees, three-quarters of a pound of potash and four quarts of fine sand. Coloring matter may be added if desired. Apply with a paint or whitewash brush.

This wash looks as well as paint, and is almost as durable as slate. It will stop small leaks in roofs, prevent the moss from growing over and rendering it inflammable from sparks falling on it. While applied to brick work it renders the bricks utterly impervious to rain; it endures as long as paint, and the expense is a mere trifle.

WHITENESS THAT WILL NOT RUB OFF.—Slake the lime in the usual way. Mix one gill of flour with a little cold water, taking care to beat out all the lumps; then pour on it boiling water enough to thicken it to the consistency of common starch when boiled for use. Pour it, while hot, into a bucket of the slaked lime, and add one of whitening. Stir all well together. A little "blue water," made by squeezing the indigo bag, or a little pulverized indigo mixed with water, improves it.

DIAMOND CEMENT FOR CHINA AND GLASS.—Soak isinglass in water till it is soft, then dissolve it in proof spirits. Add to this a little gum-ammoniac or galbanum and mastic, dissolved in as little alcohol as possible. Shake well and put in a bottle with a good cork. When used it must be liquified by placing the hottle in warm water; apply it to the broken edges with a camel-hair brush, or in the absence of that, the tip of a feather. This cement will resist moisture.

How to Make Good Soups.

To make the best soups, use lean, juicy, fresh-killed meat; beef, veal, mutton, kid, lamb, or venison. Proportion the water to the meat in preparing the broth. To one pound of meat, add three pints of water, and reduce it by boiling, to one quart. Place the soup-pot over a slow fire, which will make the water hot without causing it to boil, for at least half an hour. *Gentle stewing is best.* If the meat used is a leg or shin of beef, crack the bone in several places. To this, any trimmings of poultry may be added; a few slices of lean ham, if a large quantity of soup is to be made. The vessel in which soup is made, should have a close, well-fitting cover, which should be carefully kept in its place during the whole process. This will not only preserve much of the nutritive part of the juices of the meat, by preventing evaporation, but prevent smoke getting in, which would spoil the flavor of the broth. As the water begins to boil, a quantity of scum will rise to the top, which must be frequently and carefully removed. When the water looks clear, the vegetables and salt may be put in. After this is done, place the pot, *carefully covered*, where it will boil gently. It will require from three to four hours to prepare soup properly, unless the broth has been made the previous day. When convenient, it is a good plan to boil the broth the day before it is to be used; when it cools, the fat can be more easily removed, and if a variety of dishes is to be prepared, this arrangement will lessen the labor of the cook. The broth will keep perfectly well, but must not stand in a metallic vessel. Keep some spare broth in case your soup boils too thick. If this is not done, and more fluid is required, use *boiling water*. Cold water will injure the quality of the soup. When wine is used, it should never be put in more than ten or fifteen minutes before sending to the table. Spices and pepper should be tied in a thin muslin cloth, so as to be easily taken out. All bones, gristle, and pieces of fat should be carefully removed before serving. As much of the meat as is needed, should be cut in small pieces and put in the tureen before the soup is taken up. The broth being well prepared, the difference in soups depends mainly upon the seasoning. Says an old English writer, from whom I have already quoted: "The art of composing a rich soup is, so to proportion the several ingredients one to another, that no particular taste be stronger than the rest; but to produce such a fine, harmonious relish, that the whole is delightful."

KITCHEN UTENSILS.—That the duties of the cook may be properly performed, there must be suitable apparatus to work with. All other trades require nice tools suited to the business to be done, and why should not the claims of this important functionary be admitted. In many kitchens—perhaps the majority—an insufficient number of utensils is furnished, and those without any regard to adaptation, with the unreasonable expectation that, whatever the variety to be served up, all shall be performed in a skillful manner. A liberal supply of cooking utensils is good economy; it saves both time and labor. It is *wise* management to curtail expenses in fitting up the parlor, in order to spend in fitting up the kitchen. An old English writer upon the subject has humanely observed: "There is real enjoyment in a well-cooked meal; and as the practice of cooking is attended with so many discouraging difficulties, so many disgusting and disagreeable circumstances, we ought to have some regard for those who encounter them to procure us pleasure, and to reward their services by rendering their situation in every way as comfortable and agreeable as possible."

THE GRAVE.—It hurries every error, covers every defect, extinguishes every resentment. From its peaceful bosom spring none but fond regrets and tender recollections. Who can look down upon the grave of an enemy and not feel a compunctious throb that he should have warred with the poor handful of dust that lies moulding before him?

DANIEL WEBSTER said, "If we work upon marble, it will perish; if we work upon brass, time will efface it; if we rear temples, they will crumble into dust; but if we work upon immortal minds—if we imbue them with right principles, with the just fear of God and love of our fellow-men, we engrave on these tablets something that will brighten for all eternity."

There is a man in Mason, New Hampshire, who hasn't lived in his house since his wife died there, ten years ago. His furniture remains unmoved and undusted. He hoards out where they will keep him for \$2 a week.

Life Thoughts.

THE greatest glory is not in never falling, but in rising every time we fall.

Be true to God and yourself, and you will be true to mankind.

Those who blow the coals of others' strife may chance to have the sparks fly in their own faces.

God writes his gospel, not in the Bible alone, but on trees and flowers and clouds and stars.

The aim of an honest man's life is not the happiness which serves only himself, but the virtue which is useful to others.

Wisdom does not show itself so much in precept as in life—in a firmness of mind and a mastery of appetite. It teaches us to do, as well as to talk, and to make our words and actions all of a color.

In the voyage of life, we should imitate the ancient mariners, who, without losing sight of the earth, trusted to the heavenly signs for their guidance.

Do daily and hourly your nearest duty. Never mind whether it be known or acknowledged; in the blithesome "sometime" it will have its reward.

There are some conditions of the mind in which physis should be thrown to the dogs. Sympathy and love will make the pulse beat lower and the heart thro right-ly.

The Life Struggle.

The world knows no victory which can at all be compared with victory over our own passions. The struggle of life is between the flesh and the spirit, and one or the other finally gains the ascendancy. Every day, and every hour of the Christian's life, is this contest going on, and sad it is to think how often it is that victory is declared in favor of this earth, with its sinful passions. The Apostle Paul, after having labored long and earnestly in his Lord's service—after having done more for the spread of the truth than all the other Apostles, still felt that he was a human being, liable, at any time, through the weakness of the flesh, to lose all. "I keep under my body," says he, "and bring it to subjection, lest, after I have preached the Gospel unto others, I, myself, should be cast away." If this watchfulness was needed on the part of this aged and long-tried servant of God, what care and diligence ought we to exercise, lest we should lose all in an unguarded hour? Our pathway through life thickly set with snares for our feet. The seductions of passion, the allurements of vice, things to arouse our anger and stir up our heart's feelings, await us at every turn of life's devious ways, and blessed indeed is that man, or that woman, that meets them all without harm.

ETERNITY.—If nature plant in an animal a desire, it is the proof that in the constitution of that animal is the means of its gratification. Is there not a longing in the soul for the spiritual existence to the boundless extent which thought requires? And what does that point to? Where is its gratification? Where but in the new and endless life? If there is a desire to live in a larger sphere, with more knowledge and power, it is because life and knowledge are good for us, and we are natural repositories of these things. This is no speculation, but the most practical of doctrines.—*Emerson.*

LADY MORGAN'S IDEAS ABOUT YOUNG LADIES.—In a *te-te-a-te* conversation on the subject of some young ladies who had been suddenly bereft of fortune, Lady Morgan said with an emphatic wave of her dear old green fan, "They do everything that is fashionable—*imperfect*; their singing, drawing, and dancing, and languages, amount to nothing. They were educated to marry, and had there been time they might have goue off *with*, and hereafter *from*, husbands. They cannot earn their own salt; they do not even know how to dress themselves. I desire to give every girl, no matter her rank, a trade—a *profession*, if the word pleases you better; cultivate what is necessary in the position she is born to; cultivate all things in moderation, but one thing to *perfection*, no matter what it is, for which she has a talent—drawing, music, embroidery, housekeeping even; give her a staff to lay hold of, let her feel this will carry me through life without dependence."—*The Friends' Tour and Adventures of Lady Morgan.*

INFINITE toil would not enable you to sweep away a mist, but by ascending a little you may often look over it altogether. So it is with moral improvements; we wrestle with a vicious habit, or with a slanderous report, which would have no hold upon us if we ascended into a higher moral atmosphere.

GARRATT'S CONDENSING LUBRICATOR.

Or "TALLOW CUP." This is a California Invention, and the BEST and Most Economical Lubricator in use. It keeps cool, and its operations are very readily observed. Send for Circular to W. T. GARRATT, Cor. Mission & Fremont streets, San Francisco.

VAN NOSTRAND'S

Electric Engineering Magazine,

Commenced January, 1869.

Consists of articles selected and matter condensed from all the Engineering Scientific Serial publications of Europe and America.

The third volume of this Magazine is completed by the issue for December.

The growing success during the past two years demonstrates the correctness of the theory upon which the enterprise was founded. Communications from many sources prove that the Magazine has met a widespread want among the members of the engineering profession.

A summary of scientific intelligence, selected and sifted from the great list of American and European scientific journals is at present afforded by no other means than through the pages of this Magazine.

In the next volume, beginning with the January number, we shall commence some important improvements. Each number of the Magazine will hereafter contain something of value relating to each of the great departments of engineering labor.

More space than heretofore will be devoted to short discussions or elucidation of important formulae, especially such as have proved valuable in the practice of working engineers; our facilities for affording such items are extensive and rapidly increasing.

The progress of great engineering works in this country will be duly chronicled.

Selected and condensed articles, with their illustrations, from English, French, German, Austrian, and American scientific periodicals, will contribute to make this Magazine more than ever valuable to the engineering profession, and will afford a compilation without which the library of the working engineer will be incomplete.

112 Pages, Large 8vo. Illustrated Monthly.

Price \$5.00 a year in advance, single copies fifty cents.

Notice to New Subscribers.

Persons commencing their subscriptions with the 3d year (January, 1871), and who are desirous of possessing the work from its commencement, will be supplied with Volumes I., II., and III., neatly bound in cloth, for \$10.00, sent free by mail on receipt of price.

Notice to Clubs.

An extra copy will be supplied gratis to every club of five subscribers at \$5 each, sent in one remittance.

D. VAN NOSTRAND.

MILLER & HALEY'S MILLS,

BERRY STREET,

Between Third and Fourth Streets, S. F.

Having been burned out at the late fire on Fremont street, we have removed our business to the above locality, where the manufacture of sash blinds, doors, frames, mouldings, etc., in connection with a general mill business, will be carried on by us as formerly, and where we shall be pleased to see all of our old friends and patrons, and as many new ones as may favor us with a call.

Thankful for past favors, and especially for the sympathy extended to us for our late heavy losses, we intend, as heretofore, to deserve the patronage of the public by strict attention to business, fair dealings, and justice to our customers. 19v21-3m MILLER & HALEY.

New Publications.

HAND BOOK OF MINERAL ANALYSIS.—By Frederick Wohler, Professor of Chemistry in the University of Göttingen. Edited by Henry B. Nason, Professor of Chemistry in the Rensselaer Polytechnic Institute, Troy, New York. Philadelphia: Henry Carey Baird, Industrial Publisher, 406 Walnut street, 1871. 8vo. pp. 308. Price \$3. Sent by mail free of postage to any part of the U. S.

This is a collection of examples, for illustrating the most important processes for determining the composition of mineral substances, designed chiefly for use in the laboratory. It is well known to us (in the original German) as a most excellent book, and while we have been unable to compare the translation with the original, yet we can readily believe that it is good, especially as the translator has closely adhered, he says, to Wöhler's form. While the work is not intended to take the place of larger and more complete works on analysis, it is still exceedingly valuable in the laboratory. Our own copy having been misplaced somewhere at the East, we are glad to have it replaced by this translation, especially as we have not been able to get one here. We are pleased to see that the publisher has put the price quite low, for with many scientific publications in our country, the cost demands well filled pockets, if one desires keeping up a decent library.

TREATMENT OF ORES, by Dry Crushing and Concentration, and subsequent reduction at large Smelting Works, with description of Jacob's Union Ore Concentrator. By E. M. Barnum and H. S. Jacobs.

Mr. Jacobs, we are told, was the first operator of the Krom Concentrator at Georgetown, Colorado. He has had considerable experience in dry concentration (with air), and many of his remarks are true as to the advantages of such an operation, can it be performed successfully. Of the practical working of air concentrators, we have no definite data except those given by the Colorado Herald concerning Krom's machine, and tables given in this pamphlet. The Colorado Register doubts the accuracy of the gain here assumed. This same paper hints that the "Union" may be Krom's concentrator with some alteration. The pamphlet is supposed (from the title) to give a description of the machine, but nothing of the kind is given, only the process of manipulation; hence we can say nothing definitely on this point.

THE OVERSHADOWING QUESTION.—We are indebted to Hon George W. Julian for a copy of this speech, which concerns a matter of the greatest moment to our coast. Mr. Julian here treats of land matters, and takes strong ground against the "subservience to individual and corporate wealth and the practical unfriendliness to the producing classes" of the land policy of the Government. The pamphlet deserves a wide circulation among thinking men.

DEVELOPING OUR RESOURCES.—Hon. Mr. Axtell sends us copies of his speeches, delivered in the House of Representatives on January 27th and 28th. Mr. Axtell dwells on the resources of our western country and the difficulties in developing them. He advises government aid, and in this way: "I say extend your lines of survey over it at once, that each man may clearly know the boundary of his land; give one half of it in alternate sections to any responsible railroad company who will build a good road, restricting them in their charters to reasonable fares, to be regulated from time to time by Congress; give liberally in alternate sections to all companies who will construct reservoirs and canals, hindering them in their charters to sell the water at reasonable prices, without favor or discrimination; and sell the balance of the land to the highest bidders for cash, and thus encourage settlement and development, redeem this land from desolation, and give it away to settlement."

THE CHORPENNING CASE.—Hon. John Cessna, of Pennsylvania, sends us a copy of his remarks, made before Congress, in explanation of his action in the case of George Chorpennig.

CIVIL SERVICE REFORM.—We are indebted to Senator Casserly for a copy of Hon. Carl Schurz's speech on this subject. Mr. Schurz makes some excellent points in favor of a civil service reform, which, in our opinion, is one of the things most needed in our government. The speech is well worth reading.

INCOME TAX.—Senator Cole sends us a copy of his speech, advocating the repeal of the income tax, showing that the tax was an outgrowth of the war, was imposed to meet an extraordinary emergency, was intended only as a measure of temporary relief, that it now works unfairly and injuriously, and ought to be abolished.

The Rainy Seasons for Twenty-one Years.

The following table will, we think, be found valuable as a record, and as a criterion, to a certain extent, by which to judge of the future. While it is very different to give anything in the nature of a prediction, yet we can form a tolerably correct idea of the probabilities in many cases. Indeed, all human knowledge is made up of observations and experience of the past, and these observations and experiences are the only basis we have upon which to form a judgment of the future—as well as to the weather as to other matters.

Table with 2 columns: MONTHS (January to December) and RAIN (inches). Rows show data for years 1850-1870. Includes a 'Total' row at the bottom.

It will be seen by the above table, that there is a general correspondence between the amount of rain falling before the first of January of each year, and the whole amount for the season of the corresponding years. For instance, in the year 1852-3, the rainfall before the first of January was 19.413 inches, and the whole amount for the season was 35.549 inches. On the other hand, in the year 1856-7, the fall before the first of January was 3.236 inches, and the whole fall for the season was only 10.443 inches; and in 1863-4 the fall before the first of January was 3.308 inches, and that of the season 7.868.

It will also be observed that there has been but one year in the whole time, covered by the above table, in which the rainfall before the first of January was less than that of the present season to that time. That year, 1850-1, was the most remarkable we have ever had. Before the first of January there were but two sprinkles, and for the whole season but 4.710 inches. This season we had before January first but 1.575 inches, which would suggest a dry season.

We selected Sacramento as the location for our observation, for the reason that as a general thing the rainfall at that point is a better guide for that of the larger portion of the interior of the State than any point either further north or south. We would remark, however, that the rain the present season seems to have been more abundant in many other portions of the State than at Sacramento.

Artesian Wells and their Value.

Our correspondent "E. W." writes from San Felipe, Santa Clara County, under date of Feb. 8th, that the day before he arrived a gentleman of that place struck a splendid flow of water in an artesian well which he had sunk for the purpose of irrigation.

The water was spouting three feet above the 7-inch pipe when I saw it. The owner calculated that he had a sufficient stream to irrigate 500 acres of land. A former owner of this land had already sunk two wells; the first caved in, carrying with it two large trees standing on the brink, and it now forms a deep hole some 70 or 80 feet across, but the water does not seem to rise any higher than a certain point. The second one was worse still, for the rush of water forced out the pipe and then the sides caved; but the water continued to force its way up in such quantities as to threaten to flood the immediate neighborhood, and it cost about \$1,500 to stop it; which was done by means of bundles of wood and wheat sacks filled with sand. I don't know enough about this subject to say whether these accidents were caused by carelessness or the nature of the soil; but I can see the immense value a well of this character is to its owner (provided it works well), rendering him almost independent of rain, at a comparatively trifling expense. This water was struck at the depth of 112 feet; and another fine well with a flow two feet above the pipe situated about two miles from this, was reached in about 80 feet; the latter would irrigate 200 acres easily, at a very trifling cost of labor. Every freehold farmer ought to have one. If he can get a good one, it will increase the value of the land it is capable of irrigating at least \$10 per acre, probably far more. Even should he not get a good stream in one well, it is no reason why he should not in another, for they vary much in quantity, even when close together.

Artesian Wells in Pajaro Valley.

The Pajaronian, of February 9th, says:—"Within the last two weeks persons in different parts of the Pajaro Valley have been boring for water. Mr. Knowles, who resides near the beach, lately raised money by subscription for an artesian well at the school house near his place, and we learned yesterday that the work was completed a few days since, flowing water of good quality having been struck at the depth of 116 feet.

Mr. George Pardee has commenced a well of the same kind on his ranch near the beach.

Messrs. Blackburn & Waters are sinking a well with every prospect of reaching flowing water in a few days. At the last accounts they were down over 100 feet. They were unfortunately detained in their work owing to defective pipe, and were obliged to take up 90 feet of pipe. At present the work is progressing satisfactorily. Artesian wells are being bored all over the State, and no great length of time will elapse before the windmills will be superseded."

A NEWSPAPER CHANGE.—The Visalia Delta has been purchased by Mr. E. M. Dewey, formerly of the Mountain Messenger, Downieville. Mr. Dewey has reduced the subscription price of the Delta to \$4 per year (in advance), and will improve its local columns and job printing department, making it an excellent representative of that promising section of our agricultural districts.

THE SCIENTIFIC PRESS. FOR 1871.

WILL BE SPECIALLY DEVOTED TO Mining, Mechanic Arts, Inventions, and Home Industries of the Pacific States.

PRINTED ON NEW TYPE,

AND ITS READING COLUMNS INCREASED,

AND OTHERWISE IMPROVED IN VALUE.

The success of our improvements in 1870, and the reduction of our subscription rates to \$4 per annum, resulting in a large increase of subscriptions, has induced us to make the above announcement.

CLUBS AT \$3 PER ANNUM

For each name, will be received when ten or more persons co-operate in sending us their cash in advance. Don't hesitate. Forward your own individual subscription. No one knows the real value of the Press until they read it. Use your copy of the paper to induce others to subscribe, (if you like it yourself), and in subsequent remittance for a club, we will allow you the difference first paid above club rates.

DEWEY & CO., Publishers.

Meteorological Observations

AT SACRAMENTO, CAL., BY THOS. M. LOGAN, M. D. Permanent Secretary of State Board of Health.

Lat. 38° 31' 41" N., Long. 121° 29' 44" W. Height at Levee above mean low tide, at San Francisco, 74 feet. Height of lower surface of mercury, 94 feet. The amount of cloudiness is designated by figures, 0 being entire clearness; 5, half cloudiness; 10, entire clearness; and intermediate numbers in proportion. The force of the wind is also registered in the same manner; 0 being a calm, 1 a very light breeze, and 10 a hurricane. The means are derived from three daily readings at 7 A. M., 2 P. M., and 9 P. M., in conformity with the arrangements of the Smithsonian Institution.

Table with 12 columns: 1871. MONTH AND DAY, DAILY MEANS OF CORRECTED, WIND, and other meteorological data. Rows show data for February 1871.

*Thermometograph. +Rain.

REMARKS.—The expectations based upon the stormy weather of the week have been disappointed, and we have an installment of only 1.46 inches of rain to be added to the previous fall of four inches. Unless the spring rains prove more copious, we apprehend that what has already fallen will soon be evaporated by the advancing warm season, as there is but little water stored away in the sub-soil to meet the demands of the growing vegetation.

CENTRAL PACIFIC RAILROAD.

Table with 4 columns: Pass'ger, Express, Train, and Pass'ger. Rows show train schedules for January 22, 1871, including destinations like San Francisco, Oakland, and Sacramento.

OAKLAND BRANCH.—LEAVE SAN FRANCISCO, B 6 50 and 11 30 a. m. D 10 20 and 11 10 a. m. 12 00, 1 50, D 3 00, 4 00, 5 15 and E 11 30 p. m.

MARAVILLA COCOA.—No breakfast table is complete without this delicious beverage. The Globe says: "Various importers and manufacturers have attempted to attain a reputation for their prepared Cocoas, but we don't think any thorough success has been achieved until Messrs. Taylor Brothers discovered the extraordinary qualities of 'Maravilla' Cocoa. Adapting their perfect system of preparation to this finest of all species of the Theobroma, they have produced an article which supercedes every other Cocoa in the market. Entire solubility, a delicate aroma, and a rare concentration of the purest elements of nutrition, distinguish the Maravilla Cocoa above all others. For homeopaths and invalids we could not recommend a more agreeable or valuable beverage. Sold in packets only by all Grocers, of whom also may be had Taylor Brothers' Original Homeopathic Cocoa and Soluble Chocolate, Steam Mills—Brick Lane, London. Export Chicory Mills, Bruges, Belgium. 62-13

PHOTOGRAPHY.—FOR CABINET PHOTOGRAPHS, or Enamelled Cards, of the very best quality, you must go to the NEW YORK GALLERY, Nos. 25 and 27 Third street, San Francisco. Every picture warranted to give satisfaction. 0v13-6m B. F. HOWLAND

THE
ASPHALTUM PRESSURE PIPE
COMPANY,

HAVING ERECTED A MANUFACTORY
of sufficient capacity to supply their Asphaltum Pipe in
large quantities.

Are now Prepared to Take Orders
AND MAKE CONTRACTS.

This Company will manufacture Pipe and guarantee
it to stand any pressure required; it is lighter than iron
pipe and more durable, it is not affected by chemical
action, cannot corrode, and being glazed imparts no dis-
agreeable taste to water. To miners and farmers it is
invaluable; any body can put it down; it is twenty per
cent cheaper than iron pipe and ten times more durable.
For further particulars, apply at the office of the Com-
pany, Room No. 2, 645 Market Street.

Circulars sent on application. 16v21-tf

CALIFORNIA BRASS FOUNDRY,

MANUFACTURED BY KEEP & BARGION,

At the Globe Iron Works, Stockton, California.

Awarded the First Premium at
the Paris Exposition.

Patented Nov. 1st, 1864; July
21, 1866; and Oct. 9, 1866.

ADAPTED
FOR
Smelting,

Foundry,

Mining

and

Steamships.

REQUIRES

Fifty Per Cent.

LESS POWER

Than any Blower

Now in use.

One of these Blowers may be seen on exhibition at W. T. Garratt's Brass Foundry, corner of
Mission and Fremont street. They are also in use at the Almaden Quicksilver Mine; Gridley's
Foundry, Gold Hill, Nevada; Aetna Iron Works, San Francisco, and many other places.

CAUTION.—Purchasers will find it to their advantage to apply direct to the Stockton Agency, as
certain parties, not authorized to manufacture the Blower, have put in the market machines of inferior
construction, which do not answer all the requirement of the genuine article.

Quartz, Saw and Grist Mill Irons, Steam Engines, Horse Powers, High and Low
Pressure Steam Engines, Steamboats and Propellers, made at short notice.

NOVELTY MILL AND GRAIN SEPARATOR.

THE undersigned having purchased of the Pa-
tentees, WILTS & SWIFT
of Hudson, Michigan, their right to this mill
Patented June 22d, 1869
for California, Oregon,
Washington Territory,
Montana, Utah, New
Mexico and Arizona, wish-
es to call the attention of
FARMERS, MILLERS AND
GRAIN DEALERS to one of
THE GREATEST IMPROVEMENTS OF THE
AGE for cleaning and sep-
arating grain. While it
combines all the essential
qualities of a first-class
FANNING MILL, it also far
exceeds anything that has
ever been invented for the
separation of grain. It has
been thoroughly tested on
all the different kinds of
mixed grain, separating all
the different seeds in almost
a magical manner, placing
them in their different com-
partments in the mill arranged
for their reception, at the
same time taking out all
the Mustard, Grass Seed,
Barley and Oats, and mak-
ing two distinct quali-
ties of wheat if desired, thereby selecting superior, large plump and perfect kernels for SEEN WHEAT, and all the
small and cut kernels, such as merchantable wheat, is deposited in another compartment. By the use of this
Mill a great quantity of wheat usually sown that has been cleaned in the common mills will be saved to the
farmer, as the cut or shrunken kernels will never germinate.

The above mentioned Novelty Mill is the only mill known to possess all these superior qualifications, and was
exhibited and tested at the last Michigan State Fair held at Jackson, Michigan, September 21, 22, and 23, 1869, and
bore away the palm over some thirty other different mills from all parts of the United States, including the fa-
mous Dickey Mill of Racine, Wisconsin. All who have witnessed here the operations of the NOVELTY MILL, de-
clare it perfection, and the most beneficial invention to the Farmers, Millers, and Grain Dealers ever introduced
on the Pacific Coast. The farmers in Santa Clara County, are loud in its praise, and also in other parts of the
State where it is being introduced. No. 1 Mill, complete, is capable of cleaning 25 tons of grain per day; No. 2
Mill, 15 tons; No. 3 Mill, 8 tons. A large number of recommendations and certificates of the practical working
of the mill will be furnished. Circulars containing references sent free by mail. N. B. Town, County, or State
Right for sale on favorable terms. For further particulars apply to

STEAM JET PUMP.

Blakelock & Williams' Patent.—For
Water, Oils, Acids, Etc.

The best COLD WATER
PUMP for filling tanks for
stationary or portable
Steam Engines. Also highly
recommended for
MINES, DISTILLERIES,
SALT WORKS, STONE
QUARRIES, and similar
places, and saves the ex-
pense of putting up and
running an engine.

We ask the attention of
all proprietors of steam
power to the following
points of merit.—It is
operated by steam taken
directly from the Boiler
into the Pump; it has no
valve or wearing parts of
any kind; it requires no
belts, pulleys, or machin-
ery of any kind; it op-
erates entirely independent of an engine; it will not choke
up with foul water; it costs much less to put up and
start; it will not wear out in a lifetime, or require re-
pairs; it is reliable, and certain to work at all times; it
is not liable to injury from freezing.

Satisfaction guaranteed or the money refunded.

Seldon's Steam Packing for Stuffing Boxes. All kinds new and second-hand Machinery in stock and supplied. No. 9, First Street, near Market, San Francisco, Cal. 23v21-3q516p

RIDER'S
Automatic Cut-off
Vertical Engines
Manufactured by the
Albany St. Iron Works,
NEW YORK.

These Engines are simple, compact and durable, and in point of economy of fuel and space are excelled by none, and are cheaper than any other first-class cut-off Engines in the market. Descriptive pamphlets and price lists mailed free on application to the proprietors, HENDREN & RIPLEY, Corner Albany and Washington Sts., New York. 26v20-1y16p

PACIFIC
Rolling Mill Company,
SAN FRANCISCO, CAL.

Established for the Manufacture of
RAILROAD AND OTHER IRON
—AND—
Every Variety of Shafting.
Embracing ALL SIZES of
Steamboat Shafts, Cranks, Piston and Connecting Rods, Car and Locomotive Axles and Frames
—AND—
HAMMERED IRON
Of every description and size.
Orders addressed to **PACIFIC ROLLING MILL COMPANY** Post Office, San Francisco, Cal., will receive prompt attention
The highest price paid for Scrap Iron 9v143m 9p

THE AMERICAN SUBMERGED PUMP.

Has no leather packing, is composed entirely of metal, rendering it less liable to get out of repair than the ordinary packed pumps. It is admirably adapted for Irrigating purposes and for Watering stock.

As a Safeguard against Fire it has no Equal,

One of the medium size being capable of protecting an ordinary frame dwelling. In short it is an article that

Every Farmer should have on his Premises.

PRICE LIST.

No. 0.—Iron, \$15; Iron Galvanized, \$17; Capacity, 500.....	Gallons per Hour.
"1.—" 25; " 30; " 1,000 to 1,200.....	" " "
"2.—" 40; " 45; " 2,000 to 2,500.....	" " "
"3.—" 70; " 75; " 4,000.....	" " "

Larger sizes made to order of any required capacity. Hand power.

MANUFACTURED AND FOR SALE BY

PACIFIC PUMP MANUFACTURING COMPANY,
318 Pine street, San Francisco.

WIESTER & CO.,

No. 17 New Montgomery Street, San Francisco.

PATENTS BOUGHT AND SOLD ON COMMISSION.

Longshores Combination Tool.

This device is just what its name indicates. As a KITCHEN Tool it is indispensable. It will fit and lift with perfect safety, any Stove Lid, Frying Pan, Pie Pan, Pot, Kettle, or any other vessel or dish used about a stove. It is a complete tool for stretching carpets, driving tacks, pulling tacks, &c., &c. It answers the double purpose of hammer and pincers, and is also a good Nut Cracker. It is made of the best malleable iron, and the Hammer, Pincers and tack puller, are all hardened so as to stand the roughest usage. An Agent is wanted in every town on the Pacific Coast to sell this valuable little implement. Retail price fifty cents.

New Gas Light.

This Light takes the place of the Candle, the Kerosene Lamp and Coal Gas. Each Lamp is a perfect Gas Factory, making its own gas as fast as it is required. It is a safe, cheap and beautiful light. Circulars and full particulars sent on application. A few good traveling agents wanted to sell this and other valuable Patents.

Hay Press.

The best and cheapest hay press in the United States. Presses furnished at manufactory cost to parties buying County or State Rights. The profits on a few Presses will pay for a county Right.

New England Spring Bed.

The cheapest and best in the market. Rights for sale and beds at cost. Send for descriptive circular.

Logan's Rubber Back Lash Spring

Patented May 17, 1870. The attention of Manufacturers and Mill Owners is respectfully called to the above valuable invention for

Preventing Back Lash in Mill Gearing.

No argument is deemed necessary to convince an intelligent Miller of the importance of preventing back lash, as it is well known that both the quantity and quality of the flour depends largely upon the steadiness of motion of the Burrs. Whenever the motion is communicated by an engine having two points in the revolution of the Fly Wheel where no power is applied, there must be an unequal motion, and consequently more or less back lash. By the use of a very heavy fly-wheel or a high speed, this inequality of motion may be diminished but it cannot be entirely prevented, and more steam will be required than with a lighter fly-wheel or slower speed. By the use of

Logan's Patent Rubber Springs,

the Back Lash is entirely prevented. The pinion being loose upon the spindle, and the connection between them being by the springs, the action of the springs keeps the cogs of the pinion at all times firm against those of the driving wheel, while a continuous forward pressure is given to the spindle and through it to the Mill-Stones. The Right to the Pacific Coast is placed in our hands for sale at a very low price. Parties interested will please write for descriptive circular or call at our office and examine the model. A large number have already been sold and put into use in the Eastern States, and three are in daily use in a flour mill in this state. Parties buying territory will be furnished with the springs at manufacturing cost from the Factory in Illinois, or will be furnished with a sample to manufacture from free of charge.

WIESTER & CO.,

17 New Montgomery Street, (Grand Hotel), San Francisco.

HALLIDIE'S

Endless Wire Rope-Way,

For the economical transportation of ORES, LUMBER and other material over difficult roads, or from otherwise inaccessible points.

CONSTRUCTED BY DAVID R. SMITH,

Civil and Mechanical Engineer,

519 Front street, San Francisco, by contract or otherwise.

Communication by letter to Lock Box 1161, San Francisco Post-office. 1e18-tf-16p

PACIFIC FILE WORKS,

No. 53 Beale Street, between Market and Mission,
SAN FRANCISCO.

FILES of every description made and re-cut to order, JOB GRINDING of all kinds done at short notice. A complete assortment of New Files constantly on hand. Reaper and Mower Sections, Bars, etc., made to order. All work warranted. Orders from the country promptly attended to. No Chinese employed. 1e18-3m ROSS & HARVEY, Proprietors.

W. T. GARRATT & CO.
CITY
Brass and Bell Founder,
Corner Mission and Fremont Streets,
MANUFACTURERS OF
Brass, Zinc and Anti-Friction or Babbet Metal
CASTINGS,
Church and Steamboat Bells,
TAVERN AND HAND BELLS, GONGS,
FIRE ENGINES, FORCE AND LIFT PUMPS.
Steam, Liquor, Soda, Oil, Water and Flange Cocks, and Valves of all descriptions, made and repaired. Hose and all other Joints, Spelter, Solder and Copper Rivets, etc. Gauge Cocks, Cylinder Cocks, Oil Cocks, Steam Whistles. **HYDRAULIC PIPES AND NOZZLES** for mining purposes. Iron Steam Pipe furnished with Fittings, etc. Coupling Joints of all sizes. Particular attention paid to Distillery Work. Manufacturer of "Garratt's Patent Improved Journal Metal." Highest Market Price paid for OLD BELLS, COPPER and BRASS. 6-tf
W. T. GARRATT, JAMES HILLMAN, W. T. LITTLE.

N. W. SPAULDING,
Saw Smithing and Repairing
ESTABLISHMENT.

Nos. 17 and 19 Fremont St., near Market.
MANUFACTURER OF
SPAULDING'S
Patent Tooth Circular Saws.
They have proved to be the most durable and economical Saws in the World.
Each Saw is Warranted in every respect
Particular attention paid to construction of
Portable & Stationary Saw Mills.
MILLS FURNISHED AT SHORT NOTICE
At the lowest Market Prices.

H. ROYER,

Manufacturer of LEATHER BELTING AND LACING, MADE OF FULLED RAWHIDE. Factory, South Park Mills, Brannan street, bet. Third and Fourth, San Francisco.

VOLUME XXII.
Number 9.

Harvesting Machines.

Reaping machines are peculiarly American. Although dreamed of and rudely experimented with in other countries for generations past, it was American genius and skill which turned these dreams into realities and produced the first really practical reaper and mower.

The first reaper, Mr. McCormick's, as made in 1848, was a queer and cumbersome-looking affair, yet it did good work, because it was founded on correct principles of construction, the same principles which, it is worthy of note, are to be found in one form or another in every machine of the present day. There is an old cut extant

and after sweeping across the platform, it as gently resumes its place as part of the reel. The revolving and eccentric motion of the rake being regular, continuous and well balanced, it is consequently free from all jars or jerks, and better still, whatever grain falls on the platform is sure to be raked off in good shape, let the straw be six feet long or but six inches.

As a mower, it cuts four feet wide with a separate cutter bar. When ready for mowing, it is identical with the Prize Mower, which we may perhaps describe hereafter.

The Advance was produced in 1868, but was not offered to the public until it had been thoroughly tested by the manufacturers. Then it was put on sale, and has been

IRON ORE IN WYOMING.—About a year ago, iron ore in large amounts were discovered about 40 miles from Cheyenne, where there is said to be "a mountain of almost pure magnetic iron." The *Post* describes this as "a spur of the Black Hills, an isolated peak, a mile long by several hundred feet wide, rising almost perpendicularly 2,000 feet above the general surface on the west side, and covered with earth and drift on the east. The ore is stratified and entirely free from rock. The blocks are crystalline and break with a fracture almost like cast-iron." South of Cheyenne immense deposits of brown hematite have been found. The *Cheyenne Leader* states that lately a sample lot of 1,000 pounds

STOCK AND TILLAGE IN GREAT BRITAIN. The area of land under tillage in Great Britain is only 53 out of every hundred acres, viz:—Scotland 22 per cent. Ireland 76, Wales 53, England proper, 71. Ireland has the largest proportion of cattle, Scotland of sheep, Ireland and England of pigs. In 1869 there were altogether in Great Britain, 5,300,000 cattle, 29,500,000 sheep, and 1,900,000 pigs—the annual consumption of poultry is equal to 20,000,000 head.

THOMPSON STEAM WAGON FOR LOS ANGELES.—The *Los Angeles News* says that one of the Thompson steam wagons is to be tried on the route between Los Angeles and the Yellow Pine Mining District with

THE MCCORMICK "ADVANCE" REAPER AND MOWER.

which shows the old reaper, and which would bring a smile to the face of our readers could we show it to them. This, however, we cannot do; but, in place thereof, we give an illustration of the McCormick as made in 1871, the so-called "Advance" reaper and mower.

The Advance is a self-raker, cutting a swath five feet wide, and delivering the grain at the side of the machine, where it can lie undisturbed until it suits the farmer's convenience to bind it, or until it is fit to bind: for grain is seldom in order to bind as fast as cut. It is often cut green to save it from some threatened danger, or so weedy that immediate binding is out of the question. The cutter is a serrated-edge sickle, which will cut an entire season without grinding. The rake revolves with the reel as one of the fans, until it brings the grain past the sickle, when it gently parts company with the other reel fans,

very successful, and a large number of testimonials are given to its excellence. The machines are light, simple, strong and durable, and the manufacturers warrant them. The price of the Advance is \$200.

The machines are manufactured by C. H. McCormick & Bro., Chicago, who may be addressed for any further information.

CONSUMING SMOKE.—According to the *Iron Age*, a number of experiments made in Ohio, show that nothing is so simple and effective in preventing the escape of smoke as the introduction of sufficient oxygen into the furnace to effect complete combustion of the fuel.

NEW STAMP MILL.—Mr. James Creighton, of Placerville, has just completed and commenced working a ten-stamp gravel mill in El Dorado county.

was sent to Omaha to be tested by the Master Mechanic of the U. P. shops, who found that the ore contains 80 per cent. of pure iron. We do not know how competent the master mechanic may be to test iron ore, but if he really returned this amount, we may be permitted to suggest that it be tested by somebody else. The ore may be very rich, but the very purest magnetite, which is a compound of the protoxide and the sesquioxide of iron, is composed of 72.4 per cent. of iron and 27.6 per cent. of oxygen. The purest kinds of the ore furnish, by good management of the furnace, about 70 per cent. of crude iron; on an average, from 50 to 55 per cent. may perhaps be calculated on. All accounts, however, tend to show that Wyoming has a future in the iron business.

THE GREAT HAMMER, "Eritz," at Krupp's works in Prussia, weighs 100,000 pounds and cost \$540,000.

a view to introducing that means of transportation, if it can be made practicable.

LARGE GROWTH.—There is a castor oil plant in a garden in Memphis, Tennessee, which was planted in May, 1870, and in November of the same year, it had grown to a height of 23 feet, with an overhanging foliage of 15 feet diameter. The trunk was 18 inches in circumference, at 10 inches above the ground.

TARIFF ON COAL brought into this port. On all except anthracite and bituminous coal, 40 cents per ton; anthracite coal is duty free; bituminous, \$1 25 per ton; dust or screenings of bituminous coal, \$1 25 per ton; coke, 25 per cent. *ad valorem*.

PASSENGER TRAINS commenced running on the Copperopolis railroad on the 22d. ult.

MECHANICAL PROGRESS.

THE BARRON STEEL-MAKING PROCESS.—Of this Dr. Newberry says: "This is a new method, and one perhaps not yet beyond the condition of an experiment, but it has at least sufficed for the production of steel of as fine a quality as has ever been made by any other means. The whole process consists in exposing malleable iron to the action of gaseous hydro-carbons at a temperature just below that of fusion. Under these circumstances the iron rapidly and regularly absorbs the carbon of the gas, and becomes steel. By the Barron process, shapes of iron are converted into steel without change of form, and this is the most satisfactory application of it I have seen. For example: tools or implements of any kind may be moulded and cast, these shapes made malleable by the ordinary process, and then, by impregnation, converted into steel, coming out as scissors, knives, axes, or other implements of the very best quality, with no forging whatever. Whether this method is capable of effecting cheaply the conversion of large masses of iron, is not yet demonstrated, though it is claimed; but from the fact that a piece of iron may by this means be covered with a sheet of enamel, or coated with a layer of any desired thickness of steel, while yet retaining all the toughness of its iron core, and that by a coating of clay, the absorption of carbon may be limited to any portion of the surface acted upon, it is evident that this method is destined to have extensive application in the arts. The quality of steel made by this process is such as leaves nothing to be desired. With tailors' shears, cast in form, made malleable, and then converted by the Barron process, I have cut Florence silk so nicely as to prove the edge perfect; then with these same shears have cut up sheets of tin and untempered steel; returning to the silk have found the edge wholly unimpaired, and this after a repetition of the trial more than twenty times."

FOUR-CYLINDER LOCOMOTIVE WITHOUT OSCILLATION.—At a meeting of the London Institution of Civil Engineers, Jan. 24th, W. B. Adams read a paper upon "Train Resistance on Railways." *Engineering* gives an abstract, from which we quote: "A new class of engine, adapted to give great increase of power and steadiness, was described, in which four cylinders might be used without causing oscillation. The engine had eight driving wheels, the four central flanged, with a sufficient length of wheel base for steadiness, and the end wheels with plain tyres, adapted to run without flange friction round curves of 3 chains radius. The cylinders were placed at the central length of the frame, equidistant between the four wheels—two on each side, one under the other; the two pistons on each side working in opposite directions, and thus neutralising oscillation, each piston working a pair of coupled wheels. The engine might be worked by one set of eccentrics on the forward axles, but in case of an irregular slip of the wheels interfering with the due entrance and exit of the steam, eccentrics could be used to each pair of cylinders, and either pair have the steam shut off at pleasure, by the driver on the foot plate, when the full power might not be required. An express engine on a similar plan might have the four end wheels drivers, and the four central wheels sliding laterally to suit curves."

ENGLISH VS. AMERICAN WOOLENS.—A *Tribune* correspondent gives the reason why the first hold color best: "The fatty matters in the pores of the wool or adhering to its fibers cannot be completely removed at one operation, even by the best chemical agents known to the trade; and, as my informant describes it, the practice abroad is to keep wool for first-class goods three years, giving it a cleaning process once each year. In this way the fatty matter on the surface of the wool is eliminated by the first cleansing process; that which gradually exudes during the first year, by the second cleaning; and so on till the whole is finally removed, and the wool left in a condition to take the dyes well, and also to become thoroughly shrunken before being made up. On the other hand, as the American manufacturers do not thoroughly cleanse their stock, the fatty matter left therein not only prevents the complete penetration of the dye, but renders it impossible to fully shrink the goods made therefrom."

NAYLOR'S CONTINUOUS BRAKE.—London *Engineering* speaks of this as one of the most promising devices yet. It is about to be applied on the London & Dover Railway. We quote:—"Mr. Naylor fits each brake carriage with a long brake lever fixed on the weigh shaft which carries the arms by which the brake blocks are applied. This long lever is, when the brake is out of action, held up by a chain, which passes under a pulley at its extremity, this chain extending throughout the train, and being kept taut by suitable appliances. On this chain being slackened, the long lever falls partly on account of its own weight and partly because it is pressed down by the action of a spiral spring. * * The chain which holds up the levers can be released with great promptness by simply slackening a brake applied to the drum on which it is wound, and this being done the brakes go on throughout the train one after the other as fast as the chain can run out, and under the influence of the springs this is very fast indeed. Of course in the event of the train parting, the brake chain is broken, and the brakes brought at once into action, so that if the breaking away occurs on an incline the brake will be applied before the hind part of the train has time even to commence running back. In this respect Mr. Naylor's arrangement possesses a decided advantage over those in which it is necessary that the train should run a certain distance before the brake blocks are applied. For tightening the chain, and thus taking off the brake, Mr. N. employs several arrangements, according to circumstances."

THE SHERMAN IRON PROCESS.—We have before spoken of this. London *Engineering* for Jan. 27th has a second article upon it, giving its rationale, and stating that further experiments have been successful, especially in the puddling of iron. We quote:—"The Sherman process consists in the application of iodine, for the purpose of removing sulphur and phosphorus from the iron. The specification of Mr. Sherman's patent is very well worded, and covers all forms and methods by which a metallurgist can directly or indirectly apply iodine for effecting the purpose in view. The rationale of the process, however, is not given in the specification, nor is it readily perceptible on the face of any description of the process itself, particularly when the smallness of the quantity of iodine employed by Mr. Sherman is taken into consideration. It appears, however, that an indirect action may take place between the phosphide of iron in the liquid metal, and the free iodine in contact with it, by which a combination of iodine and phosphorus is formed. This new compound is readily decomposed by contact with the atmosphere, or with additional quantities of phosphide of iron, and the iodine leaves the phosphorus in the amorphous state, in which it seems to be unable to combine with the iron, but is readily burnt, and escapes as vapour or phosphorous acid with the flame. The property of iodine to render phosphorus amorphous is well known, and the action upon the phosphorus combined with the iron may be analogous to this interesting reaction of the two elements upon each other."

EFFECT OF COLD UPON IRON AND STEEL.—A series of papers have been read before the Manchester Philosophical Society, upon the question of the effect of intense cold upon the strength of iron and steel, and the results show that the cold has no appreciable effect. Mr. W. Brockbank collated the results of experiments made by various persons. Similar bars were tested whilst frozen, and after having been thawed and allowed to cool to the ordinary temperature. The frozen bars were more crystalline, and showed no sign of fiber, whilst those thawed show a good amount of fiber, and were slightly crystalline. Dr. Joule has made a series of experiments upon the subject, which result in the general conclusion that frost does not make either iron (cast or wrought) or steel brittle, and that accidents arise from the neglect of the companies to submit wheels, axles, and other parts of their rolling stock to a practical and sufficient test before using them. The experiments by Mr. P. Spence, which form the subject of another paper, showed that reduction of temperature, other things being equal, increases the strength of cast-iron. *Lond. Min. Journal*, Jan. 28.

THE GLUE WORKS AT PEABODY, MASS.—cover 33 acres of ground and produce about 2,260,000 lbs. per annum, mostly of cabinet and the higher grades of glue.

SCIENTIFIC PROGRESS.

MIVART ON THE GENESIS OF SPECIES.—This new book is reviewed in *Nature* for Feb. 2d by Alfred W. Bennett. We have space only for a brief notice of this review. Mr. Bennett names the objections brought forward by the author against the theory of Natural Selection, and dwells for a time upon those most fully worked out in the book. He remarks that "hitherto the attention of those naturalists who have concerned themselves with the intricate problems of organic life, has been directed almost exclusively to the animal kingdom;" while he believes that on the contrary more light will be thrown upon them by a consideration of the phenomena of the vegetable kingdom. "Plants have less power of adapting themselves to new conditions; their locality and their food are prescribed for them by the circumstances of their birth; here therefore we might expect to find the rule of survival of the fittest to reign supreme." Mr. Bennett closes thus: "The present state of the argument we take to be this:—The theory of Natural Selection, in the hands of Mr. Darwin and Mr. Wallace, afforded a simple, a beautiful, and a valid solution of the origin of a large number of the organic phenomena by which we are surrounded; by many disciples of Mr. Darwin it has been assumed, perhaps too rashly, as adequate to account for the entire evolution of all the existing forms of animal and vegetable life from one or a few primordial germs. To this idea, so seductive in its very simplicity, a number of more or less cogent objections have now been urged. It is possible that on still closer examination, these objections will be found to break down; but in the meantime we must suspend our judgment; and in order to save defeat, the next move must be made by the advocates of Natural Selection, a *prima facie* case against them having at all events been made out. Mr. Mivart has no counter theory to propose, beyond a belief that there exists in all organic life an innate power analogous to intelligence, which controls their actions as reason does those of men. Should the inquiries which are now being energetically pursued on every side result in our acquiring more accurate knowledge of such force, it will be safe to predict that to it will then be ascribed a more easy and natural solution of many phenomena which we are now forced to attribute to Natural Selection."

"BALL LIGHTNING."—A paper was read, Jan. 12th, before the Royal Society, by C. F. Varley, in which were detailed some new electrical experiments. One of these, which the author thinks may afford an explanation of the phenomenon known as "ball lightning," we copy,—premising that a Holtz machine was used, and that the brass balls on the poles were about an inch in diameter:—"Tie to the negative pole a small thin strip or filament of wood three inches in length, and bent so as to project on each side of the negative pole, and a little beyond it towards the positive. On rotating the machine, two bright spots are seen upon the positive pole. If the positive pole be made to rotate upon its axis, the luminous spots do not rotate with it; if, however, the negative pole, with its filament of wood, be rotated, the spots on the positive pole obey it, and rotate also. The insertion of a non-conductor, such as a strip of glass, in front of the projecting wooden end, obliterates the luminous spot on the positive pole. When the author first discovered this, he, seeing apparently pieces of dirt on the positive pole, wiped it clean with a silk handkerchief, but there they remained in spite of all wiping; he then examined the negative pole, and discovered a minute speck of dirt corresponding to the luminous spots on the positive pole. When the filament of wood is removed from the negative pole there is sometimes a luminosity or glow over a large portion of the surface of the positive ball. If in this state three or four little pieces of wax, or even a drop or two of water, be placed upon the negative pole, corresponding non-luminous spots will be found upon the positive pole, which rotate with the former, but do not with the latter. It is therefore evident that there are lines of force existing between the two poles, and by these means one is able to telegraph from the negative

to the positive pole to a distance of eight inches through the air, without any other conductor than that which the electrical machine has constructed for itself across the non-conducting gas. The foregoing seems to the author to give a possible explanation of "ball lightning;" if it be possible for there to be a negatively electrified cloud sufficiently charged to produce a flash from the earth to the cloud, a point in the cloud would correspond to the wood projection on the negative conductor; if such a cloud exist, a luminous spot would be seen moving about the surface of the earth, corresponding to the moving point of cloud over it, and thus present phenomena similar to those described by the privileged few who have witnessed this extraordinary natural phenomenon."

CONTINUITY OF THE CHALK.—The following is the concluding paragraph of an article in *Nature* by Wyville Thompson, whose remark that "we may be said to be still living in the Cretaceous epoch" has been objected to by Sir Chas. Lyell:—"Sir Charles asks if we have dredged belemnites, ammonites, baculites, hamites, turritiles, &c.; that question is, I think, best answered by the record of the old Cretaceous beds themselves, which are scarcely more remarkable for the presence of these singular and beautiful forms than for their rapid extinction. According to the view which I have felt myself compelled to adopt, the various groups of fossils characterising the Tertiary beds of Europe and North America represent the constantly altering fauna of the shallower portions of an ocean whose depths are still occupied by a deposit which has been accumulating continuously from the period of the pre-Tertiary chalk, and which perpetuate with much modification the pre-Tertiary chalk fauna. I do not see how this view militates in the least against the "resounding and classification" of that geology which we have learned from Sir Charles Lyell. Our dredgings only show that these abysses of the ocean which Sir Charles Lyell admits in the passage quoted above to have outlasted on account of their depth a succession of geological epochs, are inhabited by a special deep-sea fauna possibly as persistent in its general features as are the abysses themselves."

BASTIAN REPLIES TO FRANKLAND.—In our issue for Feb. 18th we gave the result of an experiment by Dr. Frankland to disprove Dr. Bastian's conclusions in regard to the production of organisms from unorganized matter. Dr. B. replies, in *Nature* for Jan. 26th, that the experiment proves nothing,—the conditions not being the same with those under which his own were made. The time, the temperature, the solution, and probably the character of the glass used, were all different. There was in his own case no internal corrosion of the tubes. Moreover, portions of the *pellicle* were used by him for microscopical examination,—not portions of a "flocculent sediment." He closes thus:—"Perhaps I may venture to recommend Dr. Frankland to destroy the other two tubes which are corroded, as being worthless, and to hope that in any future experiments, he will subsequently expose his fluids to a somewhat higher temperature, and also, before immersing his experimental tubes in any fluids, that he will thoroughly satisfy himself as to the transparency of such fluids to the actinic or chemical rays of light. We are informed that his tubes were 'exposed to bright diffused daylight, and sometimes to sunlight,' but any amount of exposure to light would be more or less useless if strong sulphuric acid and strong carbolic acid are as black to the chemical rays of light as nitrite of amyl and other fluids have been shown to be. Dr. Frankland makes no statement concerning this very important point."

ACOUSTIC STUDIES OF FLAMES.—This is the title of an article in a late number of *Poggendorff's Annalen*, by E. Villari. The author found that the tone of a vibrating tuning-fork was reinforced when brought near to a large gas-flame. When the flame, which was thus thrown into sympathetic vibration, was looked at through radial slits in a rapidly revolving opaque disc, it was found that, if the rate of rotation of the disc bore the proper relation to the rate of vibration of the fork, the flame appeared to be divided by stationary bands showing alternate maxima and minima of brilliance. When the rate of vibration was changed, but all other circumstances remained unaltered, the distance between the bands was found to vary inversely as the rate of vibration.

CORRESPONDENCE.

Notes of Travel in Tuolumne County.

[Written for the Press.]

Tuolumne County has a sectional area of 1,430 square miles, or 915,200 acres. There are about 45,000 acres enclosed and about 7,000 under cultivation. There are, in round numbers, 80,000 fruit trees and 900,000 grape vines; about 50,000 gallons of wine were made last year. It has an assessed valuation of \$1,700,000, and contains a population of 9,500; it has 500 miles of ditching (original cost, over \$3,000,000) and 20 saw mills, making yearly over 5,000,000 feet of lumber. The county is mountainous and celebrated for its mineral wealth, particularly of gold. It is one of the oldest mining counties in the State, from which more gold has been extracted than from any other equal area in California. (?) Some of the richest gold mines in the State are located here. Constant developments are being carried on by mining companies, and hundreds of thousands of dollars have been expended here for quartz mills alone, of which there are 45 in the county, 11 now successfully in operation.

One of the most valuable and extensive marble quarries on this coast is located about two miles from Columbia. The marble is pronounced equal to the Italian white. The quarry is owned by John McNamee; the machinery and derricks for hoisting are run by water power. This county could supply the State with lime and marble. It is well adapted to raising cereals and fruits; and the eastern half, about 15 x 30 miles, is covered with the finest of timber. It has an unlimited supply of sandstone of the finest quality, and could supply from two to five thousand tons of graphite (plumbago) yearly, of which material there are used in the U. S., annually, 10,000 tons. It has any amount of water power. With the proper means of communication (a railroad *via* Copperopolis), it could supply the San Joaquin Valley with lumber, wood and ice. And, in addition, its undeveloped mineral resources of iron, copper, zinc and lead, with a proper cheap transit to market, would yield abundantly.

They paid off this last year (1870) \$24,000 of the county debt, including interest. The outstanding indebtedness will not now exceed \$71,000. They will reduce the taxation slightly this year, and still pay off as much of the old debt next year. The current expenses also have been paid in cash, leaving a surplus and no new indebtedness, which predicts for this county that it has seen its worst days.

Sonora.

Sonora, the county seat, is distant from Stockton 64 miles. It has 1,650 inhabitants, contains two good hotels and as many lively stables, a fine public school, a very complete foundry and machine shop, owned by Messrs. Phelps, Shephard & Cowie, where, in addition to the usual machinery and castings made at such a place, they are now making a large amount of plows. Their arrangements for making of cores and baking the same are as complete as I ever saw.

E. J. Marsters, of Shaw's Flat, is the inventor of a field press and horse power that is really deserving of merit. It is mounted on wheels, like an ordinary farm wagon, and presses directly from the winnow.

Quartz Mines Reviewed.

The Confidence, 13 miles east of Sonora, is probably the best paying of the southern mines. As it is not for sale, I may be allowed to speak of its merits. It is owned by the Messrs. Holladay, of San Francisco, and is superintended by L. Gibson Esq. The hoisting works have a 40-horse power engine and the 30-stamp mill has 60-horse power engine. The mill is situated in close proximity to the hoisting works, and both are very complete. The incline shaft (inclined 30°) is down about 400 feet. At this point the ledge is from 11 to 14 feet wide. The rock has averaged for several months about \$55 per ton. From an eight days run, three weeks since, nearly \$17,000 in hullion was realized; and

about \$40,000 for the month ending at that time. At present about 60 men are employed. This company own 2,100 feet of a similar ledge, and as far as opened, (and it is the best opened mine I ever was in) the ledge has gold visible in every hundred pounds. Under its present successful management, it looks as if it would last for years to come. The extraordinary fineness of the gold in this mine makes it all the more valuable, the gold running from 900 to 920 fine, as the following figures of the relative value of gold according to fineness will explain:—gold at 800 fine, is worth \$16.53 $\frac{1}{4}$, at 900, \$18.60 $\frac{1}{4}$, and at 920, \$19.018.

The Excelsior, once so famous, is situated three miles east of the Confidence, and the geological and mineralogical features of the two are similar, if not precisely the same. The yield of this mine has been about \$325,000, the result of 20 months crushing with a 10-stamp mill. The mine is now locked up, and has been for the past five years, but for what reason I do not know. It is said to be a personal difficulty among its owners. Miners in the vicinity, who formerly worked in the mine, think it among the richest in the State. I learn that explorations have reached a depth of 175 feet and opened laterally about 400 feet. Mr. G. F. Wright, who has been absent from the State for five years past, has just returned from the East, and it is thought the mine will soon be re-opened. During the working of this mine, the company's little 10-stamp mill made several runs ranging from \$14,000 to \$25,000 per week. One lot that I know of, resulted in a clean up of \$25,800 from 50 tons of rock.

The Basin, Slope quartz claim, at Big Basin, about 20 miles east of Sonora and five miles from the Confidence, is owned by the Lewis Bros. They own a number of ledges, and are running two arrastras. The pay is found in a talcose matter running north and south. Their prospects are favorable.

L. P. MC.

[To be Continued.]

Banner District, California.

[Written for the Press.]

EDS. PRESS.—This district is undoubtedly as rich a place as has been found since early days. The principal mines are the O'Day, Maddeu, Warlock, Ladies Leg, Baileys and Cabel, and there are many more not yet fully prospected. The rock pays, on an average, about \$80 per ton, although some of the mines give a return of \$2,000, but that is picked rock. The McMechan mill has just had a run of 81 tons, and will clean up \$3,500. The McKean mill cleaned \$175 in 12 hours' run. The McMechan is a Wilson patent 2-stamp mill, and the McKean is a 5-stamp horse-power.

The great difficulty here is the want of capital. The mines are easy of access, and water and timber are abundant. The Madden company are putting up a 3-stamp horse-power mill which will be running in a few days. All the other mines are worked by the old Spanish arrastra, which is both slow and unprofitable, unless a person has mines as rich as they are here, when he can afford to lose some in the working.

BANNER.

Banner City, San Felipe Cañon, Feb. 8th, 1871.

A BAD PRACTICE.—The system of throwing all the trade and business into the hands of speculators and retailers is ruinous to the farming interests, destroys what little influence might otherwise be gained by men in that branch of industry, and puts all or most of the profit of the product thereof, into the pockets of speculators, instead of dividing it between the producer and consumer. If the producer would sell to his neighbor or the consumer at his farm, at the same figures that he sells to the retailer for and hauls it to town, sometimes a half a day or day's drive, both parties would be much benefited. I noticed some time since an account of a shipment of grain by the producer, which was a good move in the right direction and I hope it will be followed by more of the same sort.

SAN DOMINGO.—The N. Y. Tribune's correspondent, who accompanies the San Domingo Commission, writes that Prof. Blake has found no coal, but immense deposits of lignite. Also, that San Domingo has no harbor for large vessels.

Smelting Furnaces in Inyo County.

[Written for the Press.]

EDS. PRESS.—I see by the SCIENTIFIC PRESS of January 28th, that your Patent Agency have filed a caveat for Messrs. Gerrish and Hinkle for what you claim as their invention in these words: "The points noted particularly are the improved method of constructing the furnaces, so that the upper part is supported independently of the lower portion, which can thus be repaired or removed at any time without disturbing the rest of the furnace," etc.

Now, I wish to inform you that I built a furnace with that "improved method," just 19 months ago, and the accompanying pen sketch will give you a good idea of what the furnaces of this section are like. The dimensions of this furnace were furnished you in a communication signed "Crowquill." In explanation of Fig. I, I may state that the "hood," of common brick, rests upon a diaphragm, C, shown fully in Fig. III, which rests on four cast iron pillars, F. At a distance of three feet above the foundation, G, we have a supplemental diaphragm (given fully in Fig. II), which supports the upper portion of the furnace, H, between the two dia-

phragms. The supplemental diaphragm can be raised and lowered at pleasure by means of collars, Fig. III, placed around the pillars at B.

The fire in the stack is the same as in your plan, except that you have a spray of water falling in the cast down. We found by experiment that the condensed matter contained nothing of value, and therefore we utilized the ash-pit of the stack, by placing an assay furnace there, as indicated by O. A is the metal-pot, E the slag channel, and D the charge-hole. The tways are two in number, but any other number may be used as required.

The well-known integrity of your firm induces me to give you this information, as I reasonably expect that you would not wish to obtain a patent of a principle for one party, which was the invention of others. All of the furnaces used in Inyo county are built on the same principle as the one shown in the sketch. The falling water has not been tried here as yet, nor has the heated blast; they may or they may not be a good idea. Mr. M. W. Belshaw is entitled to the credit of originating this furnace.

A. J. CLOSE.

Independence, Inyo Co., Feb. 5, 1871.

Our correspondent's letter is valuable as a description of the smelting furnaces in Inyo county; but we may be permitted to make a few remarks on it, as the writer has apparently some mistaken ideas with regard to the nature of caveats and patents. We might remark that calling the plan *ours* ("your plan, etc.") is not quite correct, as it was not our plan, but one of Messrs. Gerrish & Hinkle. The point would be hardly worth speaking of, as our correspondent evidently does not wish to make us responsible for it, were it not for the fact that sometimes third parties are misled by such small points.

Our correspondent is correct in supposing that we do not wish to obtain a patent for one party for an invention made by another. Nor has our Patent Agency sought any such thing in the present case, as may be seen by examining the matter.

A caveat is merely a description of the rough plan of an invention, as it exists in the mind of the inventor, which is hereaf-

ter to be elaborated and made the subject of a patent. Naturally, any essential feature, be it new or old, is included in the description. The chimney and the shaft are just such essential features, and are necessarily mentioned.

Now, in the present case, the inventor has the plan of a furnace, the upper portion of the shaft of which, for various reasons, is to be suspended independently of the lower and less durable part. He does not seek to patent the "principle" of supporting his shaft. Principles cannot be patented. The most one can do is to patent the construction and arrangement.

As many advantages accrue from this construction, it is naturally noted as an important feature in the description of any furnace. The idea is not new, not even with our correspondent. Years ago we saw this feature in the case of iron furnaces, and in the description of the "Piltz Furnace," in the SCIENTIFIC PRESS of January 14th, and in that of the furnace illustrated June 11th, 1870, essentially the same idea is given.

The fact, therefore, that the Patent Agency has filed a caveat, in which this feature is described, does not in any possible way indicate that it seeks to patent for one party the invention of another. If, however, the inventor finds, as he works out his ideas, some new construction or arrangement by which this point can be obtained, such new construction or arrangement is patentable.

In conclusion and to complete our correspondent's description, we add the following from "Crowquill's" letter, published in the PRESS of June 18, 1870.

The blast furnace is a circular one, about 8 feet in the clear in height, and 20 inches in diameter in the clear at the bottom, with an inside batter of 95° to the top of the eight feet, built of fire brick (14 inches long, moulded in the form to make the inside diameter above stated), and 12 feet in circumference on the outside. It is hooded over all at the top with common red brick, having a square hole in the side of the hood, 18x24 inches, to admit the charges. The fire-brick are made of Kaolin (of which we have abundance here) mixed with one-third of pure white quartz sand, merely dried in the sun.

C. P. R. LANDS.—There has been filed with the County Recorder of Ormsby county, Nevada, a mortgage on all the un-sold lands of the Central Pacific Railroad Company lying in the States of California and Nevada and in the Territory of Utah. The mortgage is to secure the payment of 10,000 bonds of \$1,000 each, or ten millions of dollars, and interest thereon, payable in twenty years. The instrument is dated October 1st, 1870, and was acknowledged October 31st of the same year, and is drawn in favor of Charles Crocker and Silas W. Sanderson, trustees and mortgagees. The document bears United States internal revenue stamps to the amount of \$10,000, but has no State stamps. A duplicate of the same mortgage has been recorded in eighteen counties in California.—*Nev. State Reg.*

COLORADO OIL WELLS.—A correspondent of the Colorado Register writing from Canon City, Col., under date of Jan. 27th, says:—On the afternoon of the 27th we visited the oil wells of this locality, situated five miles from the town, on 4-mile Creek. The wells are six in number, their aggregate depth 800 feet. Four are regularly flowing two barrels per week. The crude oil is refined on the ground, and those who have used it say that it is as good as that of Pennsylvania. Several coal veins have been opened that look promising. Ten miles below town, H. M. Teller, of Central, is the owner of a vein five feet thick that compares very favorably with that found in the Boulder valley.

WINE CULTURE IN FRANCE AND PRUSSIA.—In 1869, about 47,872 acres of land in Prussia were planted with grape vines; in France, 6,018,000 acres were thus covered. The value of the Prussian crop was about \$1,968,750; of the French, about \$426,000,000.

FORT WALLA WALLA is to be sold, says the Walla Walla Union, probably for the benefit of the Northern Pacific Railroad.

MINING SUMMARY.

The following information is gleaned mostly from journals published in the interior, in close proximity to the mines mentioned.

California.

ALPINE COUNTY.

MOUNTAIN.—*Miner*, Feb. 18th: This old claim, we learn, is to be opened up by J. P. Ray, for an Eastern Company. Work is already commenced.

M. & N. W. Co.—The Monitor & N. W. Co. have adopted the Whelpley & Storer furnace for roasting, and as soon as the machinery and castings now on the way from Boston arrive, a furnace is to be put up at the Company's mill on the river. From the No. 3 tunnel of this Co., some very fine specimens of ruby ore have been taken this week, and the general character of the rock is flattering.

GLOBE.—The settlers and pulverizing barrel are being placed in position at the mill, and next week the whole is expected to be in working trim.

AMADOR COUNTY.

GOLD BARS.—*Ledger*, Feb. 25th. We saw two handsome gold bars at the Assay establishment of Peter Reichling, Thursday. The gold was from the Kennedy mine. They were valued at over four thousand dollars.

CALAVERAS COUNTY.

RICH ROCK.—*Chronicle*, Feb. 25: Thirty tons of quartz from the "Big Mine" near Railroad Flat, owned by Lewis & Bro., were recently crushed in Harris' mill at Sandy gulch. The rock averaged \$30 per ton. Another lot from the same lead, will shortly be crushed in Lewis' mill. Reed & Hillary have out 50 tons, 20 of which is No. 1, and will pay \$80 dollars per ton.

EL DORADO COUNTY.

The Placerville Democrat of Feb. 25th says: "We have had a glorious storm. It is worth millions of dollars to the miners and agriculturists of California, and will save us from financial wreck."

INYO COUNTY.

HOT SPRINGS.—*Independent*, Feb. 18th: Mining matters have received a new impetus, since the shipment and sale of ores to Swansea commenced. Seven different mines are being worked. Mr. Wheeler has sent 70 tons of ore to Swansea, and has 10 to 12 more in transit. Albert Mack has sold to the same company 24,436 pounds of ore, of an average assay of \$500 per ton. The lowest lot assayed \$245, and the highest running up to \$880 per ton, the ore coming from the Rockingham, Sentinel, Cornucopia and Comanche mines.

THE TUNNELS.—The Wittekind boys have 80 feet to make before reaching the ledge. The Oceola tunnel will strike the ledge this week. The Belmont is running in small veins of ore, and will soon reach the main ledge. The Crowning Glory mine presents 80 tons of fine ore on the dump, and at least 100 more in sight.

AGAIN the works of the Owens Lake Silver-Lead Co. fired up Saturday, and on Tuesday shipped to Los Angeles, 200 bars of bullion; and the furnaces will be kept in constant operation from this time forward.

CERRO GORDO.—A tunnel is projected which will be about a mile long, starting in at Lower Town.

BEAUDRY'S.—This furnace, said to be the most perfect of the three running on Cerro Gordo ore, is shut down for five or six days, while waiting for slag.

BELSHAW'S.—This furnace was closed last week for a short time, the hoiler having been burned through, after a run of thirty-seven days. Damages are being repaired, and the works will soon be in operation again. There are now 1,000 bars of bullion, waiting shipment, while at Beaudry's there are 6,100 bars on hand.

BULLION.—During the week ending Saturday, Feb. 21, there were shipped from Cerro Gordo eighteen lodes of bullion, averaging 10,000 pounds to the team.

COLUMBUS.—Affairs are assuming a lively phase, valuable discoveries being made every day. The average result of the ore worked at Col. Young's mill for the season will amount to \$600 per ton net. Mr. Hanks has recently refused \$30,000 offered by San Francisco parties for his mine, the Monte Diablo.

MARIPOSA COUNTY.

SALE OF MINES.—*Gazette*, Feb. 24: The old Whitlock and Sherlock property, which has lain idle for six years, has been transferred to Stephens & Lamber. They will repair the mill at Whitlocks, putting in new batteries, and will put a sufficient portion of the mine in working order. We understand that the sale is not absolute, but that Stephens & Lamber contract

to day \$20,000 for the property, if after working it eight months they shall be satisfied with it.

NEVADA COUNTY.

SENSIBLE MAN.—*Transcript*, Feb. 22d: Howell Thomas, who drew the \$50,000 in the Mercantile Library lottery, has in company with Evan Eveus and others purchased half of the Trust and Hope ground, paying therefor \$19,000. The ground is near Kate Hayes Flat, Bridgeport. It is not opened yet, and its value is owing to the fact that it is upon the well developed gravel channel.

THE STORM.—Same of 25th: The advantages of this heavy snow fall to miners cannot be overestimated. Their operations along the snow line may be impeded for a time, yet the snow will give a supply of water that will last far into the Summer, and keep the reservoirs and ditches full.

MANHATTAN MINE.—*Gazette*, Feb. 25th: Work in the mine we understand, progresses favorably. The main shaft is down 180 feet. The ledge at this depth is fifteen inches wide and prospects well.

RICH ROOK.—*Grass Valley Union*, Feb. 22d: The Green Mountain mine, owned by Biggs and Sims has turned out splendidly. Several miners have been taking rock from the croppings on shares, and Friday a crushing was cleaned up. There were crushed fifteen loads of rock, and the gold was worth in Grass Valley \$3,753, or \$250 20 to the load.

THE EUREKA.—Same of 24th: The clean up at the mill, for the two weeks' crushing ending on Saturday, yielded \$31,000.

ALTA HILL.—Same of 26th: The Altoona Co. have formally accepted the shaft sunk by M. Jeffery. This shaft is 203 feet deep and has cost \$3,000. A sump is to be excavated, which will be horizontal. There is money in the treasury, and breasts can be opened out into "once diggings;" but it is preferred at present to run bed rock tunnels so as to safely open the mine and to develop it for future economical working. The company think they are in a regular channel of gravel. The Home Co. are pushing their works with all dispatch. Their four-stamp battery is paying well, crushing gold bearing cement. The drift west has been extended and has developed very rich gravel.

PLACER COUNTY.

SHIPLEY.—*Herald*, Feb. 25th:—This mill made a clean-up, after crushing 116 tons, on Tuesday, and found one hundred and fifty-nine ounces of pure gold, or fully \$22 per ton. This rock was from the 50-foot level. This Company, John McFadden & Co., have down fifty feet two shafts, 240 feet apart, and a drift running the whole length between. This opens up the claim so that they now have 1500 or 1600 tons of quartz ready to stope out, and can take it out as fast as the mill can crush it running night and day. The mill is a new and complete ten-stamp one just finished, and the mine is just being got in working shape. The ledge is from two to three feet thick, indeed there are two ledges, the Trouble and Shipley connecting on the ground. Mr. McFadden will now run the mill and mine night and day, without any stoppage, except to clean up. The ledge passes at the surface along a ridge 150 feet higher than the mill, and only a few rods from it, and when the tunnel is run in from the mill to the ledge, thousands of tons of ore can be run directly from the mine to the batteries. This mine is five miles west of Auburn on Doty's ravine.

RICH STRIKE.—On Friday of last week, John Dillon while sluicing in his surface mine at Rock Creek above the Nevada road, three miles from here, stripped a very heavy ledge of rich quartz, tons of which show free gold in profusion to the naked eye. Some of the specimens which we saw would yield fully \$1,000 per ton.

THE WEATHER.—The storm has been of vast advantage to the miners. Heavy snow has fallen low down in the mountains and foot-hills, which will serve to supply water to the miners late in the summer, thus giving them, we hope, a long and prosperous season.

DROPPING.—The lessees of the Ceresus mine on Baltimore ravine have had milled at Pugh's mill at Ophir ninety tons of quartz, which yielded only \$900 or say \$10 a ton. Former crushings run from \$17 to \$30.

MORE RICH QUARTZ.—*Star and Stripes*, Feb. 23:—Within the past week we have been permitted to inspect two specimens of very rich gold bearing quartz rock; one from the Rising Sun ledge, near Colfax, and the other from a ledge on Rock Creek, owned by S. Dwyer, and others.

SAN DIEGO COUNTY.

FROM THE MINES.—*Union*, Feb. 16th:—Mr. McMechan's mill recently cleaned up

its first crushing since removal to San Felipe Cañon, and the bullion will be sent forward to San Francisco by Pauly & Sons per next steamer. It amounts to one hundred and thirty-two ounces, and was obtained from eighty tons of ore from the Redman mine. McKean & Co. are putting in a 10-stamp mill. Their mine is paying well all the time. Parson's mill is running steadily on Helvetia ore. The vein increases in size and richness as the shaft goes down. All the mines are looking up. The prospects are brighter than at any time since the first pick was struck.

LASSEN COUNTY.

BIG VALLEY.—*Cor. of Shasta Courier*, Feb. 25th: The diggings are nearly worked out, and no new discoveries of consequence have been made. Ehlers & Co. have taken about \$5,000 out of the original discovery claim, but their expenses have been heavy, and the best of the ground is worked out.

SHASTA COUNTY.

FORT CROOK.—*Courier* Feb. 25th: A large quartz ledge has recently been discovered on the mountain divide between Fall River and Big Valley. The croppings are said to prospect fifty cents per pound.

TRINITY COUNTY.

MINERSVILLE.—*Journal* Feb. 25th: Van Mater has worked his claim only eight days this year, but has picked up already \$400. He brought in four specimens weighing in the aggregate over nine ounces.

NEW DIGGINGS.—Thos. Stephens & Co. have discovered good drifting diggings on Virgin Point just above Junction City. Six ounces were taken out for the first four days work and the claim has since been paying from \$6 to \$8 per day to the hand.

Nevada.

COPE DISTRICT.

ITEMS.—Owyhee *Avalanche* Feb. 11th: The Vance mill has been leased to P. F. Davis, who intends replacing the grading machine with stamps. . . . It is reported that a Chicago Co. will put up a mill at Bull Run early in the spring. . . . The Argenta Co.'s new shaft is down 130 feet, and they are sinking 3 feet per day. . . . A San Francisco Co. are running a tunnel into California Hill.

Same of 18th: Samuel Heudy is prosecuting work on the Pride of the West, and taking out fine ore. . . . The El Dorado ledge, idle since its discovery, a year ago, is being worked by W. Hays & Co.

ELY DISTRICT.

BULLION.—*Record* Feb. 16th: The shipments for the week ending February 14th, amount to \$84,567.91.

Same of 19th says: We have had no mining review lately on account of sales being made and numerous disputes as regards titles and we do not wish to make any statements conflicting with either party.

COMPROMISE.—Mr. Lightner, of the Raymond & Ely Co. pays to McCannou & Co. \$6,000 for a fraction of mining ground between the Creole shaft and the East shaft on the Washington. The title was in dispute between the two companies.

FLOOD, COURTNEY & Co. are taking out ore from the Washington mine that will go \$300 a ton. Their contract with the Washington runs until the first of May. By that time the boys will make a good thing out of it.

EUREKA DISTRICT.

PALISADE.—*Sentinel*, Feb. 25th:—During the first twenty days of this month, the Railroad Co., has shipped twenty-four car loads of base bullion, containing twenty thousand pounds each. Wells, Fargo & Co., have in the same twenty days, shipped five hillion of the value of \$88,504 09.

SALE.—John Capron has just completed the purchase of the El Dorado mine. The assays made by Lundbom, gave from \$45 silver and \$55 gold, to \$246 silver; and \$200 gold per ton.

MINERAL HILL.—The Grass Valley Union of 25th notes a letter from Jas. Noel, who is at work for a Grass Valley company, and has leased a ledge which is turning out rock assaying \$1,936 to the ton. A new 15-stamp mill started up on the 19th.

HUMBOLDT.

PROSPECTING.—*Silver State*, Feb. 25: A party which has been out to look at a ledge eight miles west of Hot Springs, which was prospected some time ago, but is now made more accessible by the railroad, brought in rock from it which assays \$300 to the ton in silver.

BULLION.—The amount shipped from the Arizona mine, through Wells, Fargo & Co., since our last, was 667 pounds, valued at \$5,833.

SHIPPING ORE.—We understand that the Silver Monarch and Locomotive companies have, during the past week, brought in

from Central 30 tons of high grade ore, to be shipped to Reno for treatment. Locomotive ledge is said to have widened six feet. Clark & Brothers are the owners.

STAR CITY.—The Antimony ledge, owned by Cunningham, O'Donnell and the Spence Brothers, is looking better than ever. Work of development is rapidly going on.

RYE PATCH.—The Butte mill works well. It will shut down March 1st to receive five more stamps.

WHITE PINE.

REVIEW.—*News*, Feb. 25th: The severe storm, raging the whole week, has so far affected the working of our mines as to compel the suspending of work where there was insufficient shelter. In all the deep workings of the principal mines, however, work has gone on without cessation from that cause. The four mines connected with the new International mill have now but 12 men employed, for the reason that the mines are full of ore. The dumps are full, and there is no chance to work to advantage. There is ore enough mined to keep this mill running for six months. The tramway has been delayed by the rough weather. There are 47 stations in all for it, 37 of which are finished. At station No. 20 a ledge was discovered this week while excavating for the supports. The croppings assay \$700 to the ton, and show a ledge three feet in width. It is named the "Sharp." The ore is similar to that of the Eberhardt. All mines on the hill that are working continue to improve in appearance. The few base metal mines working show promising prospects. The Bismuth has a large body of ore in sight, easily extracted. There has been but little work done on the west side of White Pine mountain this week. The snow on top is four feet deep, and work in open cuts is necessarily suspended. It is reported that a number of the most prominent mines on the west side are to change hands soon, and be owned and worked by one company.

WEEKLY SHIPMENT.—Wells, Fargo & Co. shipped, during the last week, from this city, 19 bars bullion, valued at \$23,640.48—produced by mills in this district.

ITEMS.—The ores from the Ward Beecher are worked at the Oasis mill, which turned out \$38,000 worth of bullion last month. The pulp assays at the mill average \$140 per ton. . . . A chamber in the North Aurora, filled with waste rock, has been recently cleared out, and showed a large body of ore that assays \$400 per ton. Eberhardt has out 200 tons very rich rock. . . . Richer ore than ever has been struck in the General Lee.

WASHOE.—*Savage*, Feb. 26th: The daily yield is 120 tons, from the old and new mines. On the 9th level, the north drift is continued and cross-cuts being made east. Nothing of value has yet been found. On the lowest level the south drift is now 220 feet south from the shaft; no ore found.

CHOLLAR-POTOSI.—The yield during the week was 1,910 tons, of which 1,650 was sent to mills. The average assays have been \$62 20. The Belvidere section is looking as usual, and all the ore breasts yield as well as ever. Yesterday they sent to San Francisco \$58,666 in bullion.

HALE AND NOBACROSS.—The product during the week was 1,600 tons of ore—principally blue ore from the lower level. The south stope in the new ore-body in the southern part is extensive, and is yielding excellent ore.

BELCHER.—This is somewhat improving in appearance. About the usual ore is extracted. It is likely that the rich body of ore in the Crown Point will run into it.

SIERRA NEVADA.—The mine is yielding as usual, and both the Sierra Nevada and Sacramento and Meredith mills are in constant operation.

OPHIR.—The "up-rise" from the south drift near the Central is up 200 feet. Nothing done in other parts of the mine. It is expected that paying ore will be found in raising into the new ground above.

OVERMAN.—The usual amount of ore is coming from the mine. The suit between the Overman and the American was yesterday decided in favor of the latter company.

CROWN POINT.—There is a great improvement in the new body of ore on the 1,100-foot level as it is followed south. The drift on the 1,000-foot level has connected with the raise from the 1,100-foot level. The mine is looking well throughout.

DANEY.—The drift from the engine shaft is in 85 feet 6 inches. The ground has much improved. The prospects generally are favorable. The old mine is fast being drained.

VIRGINIA CONSOLIDATED.—The north-west drift from the main vein is in 210 feet, and passing through porphyry and

quartz. A good deal of water is coming in. **SEGREGATED BELCHER.**—There is nothing being done at present. The dumps are full of ore, but the mill on the river is not running.

YELLOW JACKET.—*Gold Hill News*, Feb. 25th: This mine continues its regular yield, and prospecting goes on as usual at the lowest levels. We saw yesterday about a dozen silver bricks, the largest worth over \$3,000. They were from the Yellow Jacket mine, there is plenty more material for just such bricks.

IMPERIAL.—The old upper portion of the mine is temporarily shut down, the dumps being full of ore. The new shaft being sunk jointly by the Imperial and Empire companies, is progressing with excellent prospects. The lowest level of all, 1,300 feet,—shows better indications than those above. The bottom of the shaft is now 40 feet below this level.

BAY STATE MILL BURNED.—The mill, at American Flat, was totally destroyed by fire on the 23d. It has been idle for the last few weeks. The fire was accidental. The mill was the property of the Union Mill and Mining Co., and worth between \$60,000 and \$70,000. It was insured for \$40,000.

Idaho.

ITEMS.—*Arbutus*, Feb. 18th: Some parties prospecting for quartz above Shuster & Co.'s placer claims in Blue Gulch, have a tunnel in 18 feet. Mr. Cassell has superceded Pheby, as Sup. of the Mahogany. Wells, Fargo & Co. shipped this week 10 bars of bullion, valued at \$25,758. Golden Chariot bullion to the amount of \$24,000 was shipped to San Francisco this week. Total shipments during January, \$136,491.

CONSUMMATED.—It is stated that the negotiations for the sale of the Atlanta ledge in Alturas county have been closed, and the mine is now owned by an English Company.

SALMON RIVER COUNTRY.—*Cor. of Helena Gazette*, Feb. 20th: On Moose Creek, parties prospecting "The Meadows," have struck bed-rock at a depth of twenty feet, and four feet of dirt that prospects from one to five cents, in one shaft twelve cents to the pan. Smith & Gordon, have moved their stock of goods over there, and are constructing a drain that will cost several thousand dollars.

BOISE COUNTY.—*Statesman*, Feb. 23d: Col. Stevenson, of Pioneer, states that there is a prospect for a goodly supply of water, and a lively mining campaign. Around Pioneer there has been a larger snow-fall than for many years. Col. Stevenson is one of the proprietors of the Portuguese claims, and is well satisfied with his prospects. He says that quartz is also looking up. Clarkson and Brown, of the Summit Flat lead, are taking out quartz of remarkable richness.

Montana.

BROWN'S GULCH.—*Cor. of Helena Gazette*, Feb. 20th: Duffey & Co. have struck a rich vein in Merrill & Ullery's claim on the Comanche, near the surface. It measures four feet in width, and occupies about half the crevice. Brown Bro. and Landis are working discovery of Comanche, and taking out two to five tons of pay rock per day. Merrill & Ullery are sinking a shaft on the Ben Franklin, and are down 40 feet. The St. Louis Co. are taking first-class ore from the Hope shaft. The Speckled Trout and smelting works of the Sanders Co. are still idle. The mill (Stewart) has averaged \$52 per ton since it commenced running—all on second-class ore. The cost of mining and hauling at this season is probably \$6.50. The cost of milling, with the present machinery, say \$15.

THE STORM.—The *Herald* of 16th says: We are of opinion that the storm has been general. If such is the case, a glorious season is guaranteed to Montana. If water be plenty, more gold will be taken from the ground during the summer of 1871 than during any previous year. Thousands of miners stand ready to use the water from miles of new ditches.

THE MONTANIAN of Feb. 16th says:—Our flume men are perfectly satisfied that we will have an abundance of water for the next mining season.

QUARTZ CREEK.—*Cor. of Missoula Pioneer*, Feb. 16th: Bed rock has been reached on claim No. 17 below discovery. In the upper district as high as \$18 per day is being cleaned up. The boys are in high spirits.

SALE.—*Independent*, Feb. 18th: Mr. R. Prince, of Henderson gulch, sold last week claim No. 3 on the Cable lode to Smith, Milliken & Cameron for \$2,100.

GERMAN GULCH.—*Cor. of same*: Several companies are drifting with fair success. The California Flume Co. is doing, per-

haps, the best. James Korr and Wright, Jones & Co. are opening the deep ground between the Edwards and California Co.'s flume.

Colorado.

CARIBOO MINE.—*Central City Herald*, Feb. 18th: The Co. are working 14 men at the east end. The pay vein is 12 to 30 inches wide. This ore is placed in sacks before it is taken from the mine. The Company cleared \$6,600 on the ore sent to Hill's in the three months ending January 1st, over all expenses of working the eastern portion of the mine, building, &c., and have a large portion of low grade ore on the dump. Breed & Cutter at the West end, have plenty of fine looking ore in sight. The main shaft is 150 feet deep, where the crevice is five feet wide with a large proportion of shipping or first and second class ores. The whole mine is looking remarkably well, and continues to hold its rank as the largest producing silver mine of Colorado. When smelting works are erected near by, the immense quantities of low grade ore which this mine produces can be treated, saving heavy shipping charges to Black Hawk.

BLACKAWK.—*Register*, Feb. 22d: Nearly all the mills that have a supply of water are full of business, many of them having more ore offered than they can receive. The number of stamps in actual operation is 402. The larger part of the ore is mined in Nevada district, though the Gregory 2d is producing constantly, and some comes from Bottell hill. All the mills in Nevada that have water, less than a hundred stamps, are of course in full operation.

THE KANSAS.—Mr. Bennett is now raising 18 or 20 cords of mill ore per week, that runs some of it as high as nine ounces per cord. The proportion of smelting ore is one ton to three cords, when sorted for high grade. The assay of the smelting ore has varied from \$94 to \$104 per ton.

GEORGETOWN.—*Miner*, Feb. 16th:—Two tons Ogden ore brought at Stewart's \$389. Shaft on the Willow lode is 82 feet deep, and the vein carries 8 inches of ore that will assay 400 ounces per ton. Nitro lode is looking well in the west drift. We have been shown a magnificent specimen of ore from the Snowdrift lode. It was a solid "chunk" of sulphurets, and is estimated to contain silver \$3,500 per ton. Ore from the Alabama, 1,600 lbs., was sold to Stewart for \$178. Cornucopia lode has a 42-foot shaft and assays \$200 per ton. Stewart Reducing Co. shipped \$5,889 for six days' run. The Shafter mine has one foot of ore that will run \$500 per ton, gold. At Empire, Ball's 12-stamp mill is crushing ore from the Howard and Silver mountain lodes.

Same of 23d: The Brown lode has a remarkably large and rich body of ore in the deep shaft. The Chester county lode, now being worked by Mr. McAfee, is yielding ore assaying as high as 635 ounces per ton. Stewart Co. shipped \$4,438, the product of 2d class Terrible ore. Two and a quarter tons Pelican ore brought \$393. Howard lode, Empire, has 5 feet solid "iron" uncovered. Munsell ore, 2,800 lbs., sold to Stewart for \$503. Rich ore and plenty of it in the Clift mine. In the Seaton mine, 303 tons ore mined in 1870 gave \$65,500, coin value, by mill treatment.

STOCKING CREEKS WITH FISH.—It is well known that all the creeks in this section which do not connect with the Humboldt river are destitute of fish. Reese river and some of its tributaries are the only ones where fish is to be found. With little trouble every creek in the country could be stocked with trout, for the experiment has been tried and proved successful. Last year Mr. Riette and others, brought to Grass Valley from Reese river a lot of the trout common in that stream and placed them in skull creek, near the ranch of Mr. Callahan. They have been left undisturbed till now, and Mr. C. informs us that fair fishing can be had in the creek at present. Let persons living on the banks of creeks emptying into Smoky Valley, and others not connecting with the Humboldt river imitate this example. —*Elko Independent*.

DRIED ANTELOPE.—The *Deseret News* says that Messrs. Hunt & Smith, of Salt Lake are shipping several tons of dried antelope and elk meat to this city. The animals were killed near Carbon, last summer, the place on the Central Pacific Railroad, where the coal mines were recently reported on fire.

The merchants of Santa Barbara propose to establish a Chamber of Commerce.

Mining Stock Market.

SAN FRANCISCO, Thursday Eve., March 2.

The mining share market has been quite lively during the last work and several descriptions of stock have fluctuated considerably. Belcher, Crown Point and Kentuck having been subjected to a very considerable rise. Amador has been quoted two or three times at \$327½ and \$325 and \$340. Overman has suffered from an adverse decision in a suit with the American Mining Company. This morning there was an upward tendency in almost every description of stock. Belcher went higher than it has been for a year, and Crown Point touched its highest figure since June, 1869. Kentuck also went very high.

The following table gives last Thursday's quotations compared with to-day's, and the highest and lowest points reached by the several descriptions of stock.

Price, Feb. 23.	Highest.	Lowest.	Mar. 2.	Adv.	Dec.

PATENTS & INVENTIONS.

Full List of U. S. Patents Issued to Pacific Coast Inventors.

(FROM OFFICIAL REPORTS TO DEWEY & CO., U. S. AND FOREIGN PATENT AGENTS, AND PUBLISHERS OF THE SCIENTIFIC PRESS.)

FOR THE WEEK ENDING FEBRUARY 14th.
PRINTING-PRESS.—Amos H. Bangle, Brooklyn, Cal.

LAMP-BRACKET FOR SEWING-MACHINES.—Henry Campbell, San Francisco, Cal.

HUB AND AXLE.—Carlos R. Donnar, Sonoma, Cal.

LUBRICATOR.—Nicholas Seibert, San Francisco, Cal.

LOCOMOTIVE-BOILER FURNACES.—Andrew Jackson Stevens, San Francisco, Cal.

NOTE.—Copies of U. S. and Foreign Patents furnished by DEWEY & CO., in the shortest time possible (by telegraph or otherwise) at the lowest rates. All patent business for Pacific coast inventors transacted with greater security and in much less time than by any other agency.

Notices of Recent Patents.

HAY AND OTHER PRESSES.—M. T. Northrup, Hornitos, Cal. The object of this invention is to provide an improved press for packing hay for transportation, and for wool or cotton. The press consists of a strong frame or box which lies on the ground, so as not to rise to an inconvenient height. A follower is arranged to move forward and back within the box. After the cords are laid, the box is filled with hay, the door at the top closed and drawn down tightly by a peculiar elbow lever, and the follower is moved by a long lever operating in a horizontal plane, one end being pinned to the follower, while the fulcrum is on a block or guide a short distance from this end. The guide moves in ways at right angles with the movement of the follower, so that as the lever is moved around, it carries the guide across the line of travel of the follower, until the outer end of the lever, the block and the follower are in a line with the plane in which the follower travels, and the follower is thus driven in so as to press the bale completely. The bale is then tied and rolled out by a side door, the lever returned to its former position, and the press again filled. By this construction, it is claimed, an excellent device can be built much more cheaply than can other forms. The power brought to bear on the bale is very great, and the labor of filling the press is comparatively light, and the whole device seems very convenient.

SEED SOWER.—S. H. Sheplar, S. F., Cal., and W. G. Conklin, Portland, Oregon. For sowing small grains, such as wheat, this revolving seed-sower seems to possess a number of advantages. It consists of a perforated cylinder, made in two parts, into each of which the grain is fed from an intermediate hopper, a peculiar trough serving to divide the grain as it falls from the hopper and convey it equally into both ends of the cylinder. In each part of the cylinder is fixed a spiral flange, which serves to convey the grain towards the ends and to distribute it equally, so that the sowing will be evenly accomplished at every portion of the length of the cylinder. The device is very simple, and is worthy of attention.

REIN-HOLDER.—W. Barstow, S. F. This simple but ingenious device consists of two vertical leaves or plates with upper edges so constructed as to present a gradually widening mouth into which the reins can be readily introduced. In the side of one of the plates is an opening to a chamber which is made narrower at its front than at its rear end. In this chamber is placed a ball of such a size that it will partly protrude into the horizontal slot between the two leaves. This ball may be held in place, so as to prevent any motion when not in use, by a spring. A cylinder may be used instead of a ball if desired. The holder may be fastened to the dashboard. When it is desired to secure the reins, they are placed together and introduced between the leaves. By drawing them a little way back, they move the ball so as to lie between it and the opposite leaf, but a forward movement causes the ball (as the chamber is narrower at the front) to bind them tightly. The whole affair is very simple and cheap and recommends itself highly for practical use.

POULTRY NOTES.

POULTRY AS A BUSINESS.

The Antioch (Contra Costa) *Ledger* very truly says: "If a man has a well-conducted chicken ranch in these days he can make money. Eggs are high, and will be higher still, before the winter is over, and chickens and ducks always have a good marketable value about holiday time—in fact they find sale at fair prices any time. A few acres of land with four or five hundred dollars, can be made to yield a good income, more than if put to any other use, and we cannot understand why farmers do not pay more attention to this profitable business. A dozen eggs is worth more here than a bushel of wheat in the Western States, and can be produced with less trouble and risk. Care and attention are requisite, to be sure, to make success certain, but no more than in any other business. There are plenty of places in this vicinity which cannot be advantageously used for any other purpose. Rabbits, frogs and terrapins will pay well, too. We have known fortunes to be made in this business with a small outlay of capital. We expect some day to see farmers paying more attention to poultry raising."

POINTS OF POULTRY.

A subscriber asks us to give the appropriate terms for the different points of poultry, so that they may be understood. To more fully illustrate the answer to the

query, we give herewith, from Moore's *Rural New Yorker*, an engraving of a cock with the points marked. A, neck-hackle; B, saddle-hackle; C, tail; D, breast; E, upper wing coverts; F, lower wing coverts; G, primary quills; H, thighs; I, legs; K, comb; L, wattles; M, ear lobe.

DETERIORATION OF POULTRY.

A correspondent of the *Poultry Bulletin*, gives the following as one of the chief causes of the deterioration of poultry: The majority of farmers have always considered Poultry of little or no consequence, and they have allowed them to run wild and take care of themselves and degenerate from year to year. They generally let them roost in their pig pen, or on their wagons, or wherever they can find a place. They seldom if ever feed them, and allow them to make their nests wherever they can, all over the premises. When they hatch and make their appearance with their chickens the farmers wives and children feed them occasionally. But they very rarely coop them and keep them out of the wet grass or feed them regularly, in consequence of which, fully seventy per cent die; of those that are raised, the largest and best are selected and sold, as they are thought to be worth too much to keep, and the culls which are not good enough to sell, are kept and bred from the following season. This results in reducing the size of poultry and eggs to an alarming degree, so that the farmers' chickens and ducks average from two to four pounds, turkeys and geese from six to eight pounds, and eggs 10 to the pound.

A certain economical doctor is so penurious that when he goes to make a call in the country he take a hen in his gig to eat up the oats his horse scatters when eating. The hen knows her business so well that she gets right out and goes to work without being told.

POULTRY RAISING.

Why Hens must be kept in Small Flocks.

Whenever we try to make any animal live contrary to its habits in a wild state, nature, unwilling to be thwarted, will have its revenge in some way. The hen originated in the jungles of India, and when wild and before taken from its native forest, this variety of bird had an abundance of pure air to breathe and plentiful ventilation through their leafy roosting places. One leader, only, accompanied the flock, who allowed no rival in his family.

With proper care a large number of chickens may be raised together; but when they begin to lay, if their natural habits are interfered with, the keeper will fail to receive due returns, as the penalty he must pay for violating a law of nature. The natural and proper way to keep hens is to provide separate apartments for every family, and not allow the family to exceed, say 25 in number, including one male bird. Mr. H. H. Stoddard, of Hartford, Conn., writes to the *Poultry Bulletin*, upon this matter as follows:—

In the Indian jungles the wild parent stock, *Gallus Bankiva*, like all allied species of fowls that live principally upon the ground, associate during the breeding season in small families, each having its male head, and appropriating an exclusive territory for a range. This being the law, as unalterable as that of the Medes and Persians, man must respect it. For three thousand years (perhaps six,) men have successfully kept domesticated fowls. They have succeeded by scattering small flocks in every village, thus unconsciously imitating the state of things in the jungles of India. Herded together in a large multitude, the ancient instinct thwarted, they will not utterly refuse to lay, (that too would be unnatural, for the tendency to produce eggs is also deeply implanted), but the yield will not be nearly so great as if they were in flocks of tens or twenties.

Scores of illustrations in poultry-keeping might be given, where Nature resists infractions of her laws. It will not do to neglect any point, because it seems a small matter. No ordinance of Nature is small.

LARGE GEES.—The weight of the prize Toulouse geese at the last Birmingham show was 57 pounds 14 ounces for the old pair, and 48 pounds 14 ounces for the young pair. The prize gander of 1868 weighed 39 pounds.

A few years since the rearing of a pair of geese that would weigh half a hundred weight would have been regarded as an impossibility. This limit has now been surpassed and we cannot believe that the "plus ultra" has been reached. I believe a cross of the Toulouse and Bremen would make the best of all geese for market, and that the goslings would average twenty pounds each at Christmas. This would be an improvement worth making, as our common market geese now hardly average eight pounds. The change would soon take place, not only with geese, but with all kinds of poultry, if the farmers would consider the importance of the subject, and take a little pains in procuring the best varieties for breeding stock. I hope the time will soon come when poultry breeding will be considered of the importance that it justly merits.—*Cor. Poultry Bulletin.*

POULTRY TONIC.—Many breeders recommend bread soaked in ale, as a healthful tonic for fowls. A writer in the *Journal d'Agriculture Pratique*, recommends for debilitated birds, especially for young turkeys when "shooting the red," the following preparation: "Take Cassia bark in fine powder, three parts; ginger ten parts; gentian one part; anise seed, one part; carbonate of iron, five parts. Mix thoroughly by sifting. A teaspoonful of the powder should be mingled with the dough, for twenty turkeys, each morning and evening. It is of the greatest importance to begin the treatment a fortnight before the appearance of the red, and to continue it two or three weeks after."

MOULTING fowls should have a few nails placed in the water furnished for their use. The rust occasioned by the nails renders them less liable to disease.

AGRICULTURE IN ARIZONA.

Arizona produces something besides gold and Apaches. Cotton of a texture similar to the best product of the Atlantic States is produced there. The seed from this Cotton has been planted in South Carolina, where Sea Island Cotton of good quality has been raised from it. Grapes bear there the second year after setting out the slips. Tobacco, figs, oranges, lemons, sugar-cane and sweet potatoes, the finest ever seen, are raised there. Corn does not do well generally, for want of rain. Irish potatoes are grown, but not with much success; the summers are too hot and dry. Wheat and barley yield from 30 to 35 bushels and more to the acre, according to the nature of the ground and care employed in the culture. A field of 90 acres was reported, last season, to have yielded a fraction over 41 bushels to the acre. Another person reports 60 bushels of barley to the acre, and a profit of \$1,600 last season, from a small farm of only 20 acres. Farming operations there, are said to be conducted very loosely. There are many extensive and fertile valleys, where the soil needs only to be scratched to yield bountifully. The cost of harvesting grain there is set down at about \$5 per acre. Fruit trees have been taken to Arizona, for the first time, we believe, the past season, and an abundance of fruit is expected there soon—a great desideratum. A good market already exists there for the limited produce heretofore produced; and the market will increase as the county fills up with miners, as must soon be the case.

The Salinas or Salt River is described as running through a beautiful and fertile valley, 20 miles long by 5 in width, and carrying an average of fully 50,000 inches of water; all of which may be utilized for irrigation purposes. The valley is so level that fully 14 out of every 15 acres can be irrigated. The only inconvenience in the way of cultivation is the mesquit, which can be easily removed. Two irrigation ditches, one on the south and one on the north side of this river are now being constructed, the former to carry 10,000 inches and to run 12 miles; the other to carry 20,000 inches. There are numerous other localities in the northern portion of the Territory which are almost or quite as favorably situated for irrigation. The future of Arizona, both as a mining and agricultural region, is certainly most encouraging.

THE TURPENTINE BUSINESS once so profitable in North Carolina is now nearly worthless. The high price of turpentine, at the close of the war, induced many people, in that section of the country to go into the business; but as the result of five years of hard labor, the people there find themselves worse off than when they commenced. They have met with nothing but disappointment, and are now said to be reduced almost to starvation. What has become of the turpentine business of this State? We have heard but little of it for the last two or three years.

NOVEL WAY OF PRESERVING GRAPES.—The Chinese have a novel way of preserving grapes, and one which is said to be very successful. They keep them in pumpkins. The pumpkin is carefully chosen; must be ripe, and without blemish. An aperture large enough to admit of the hand is made; the inside is well cleaned, and the ripe grapes are protected by a tight cover. The grapes retain excellently their size and flavor. Perhaps so.

A GOOD SUGGESTION.—The *Prairie Farmer*, in an article on prizes at Fairs, suggests that premiums be offered for plans for saving the produce of the farm, and for making the farmers' home pleasant and comfortable. It further says it should be the aim, in making up the premium list, to offer prizes "for things that will encourage research and investigation, bring forth new facts, and reward patient industry."

POPULAR LECTURES.

Chemistry and its Applications.

[Prof. EZRA S. CARL before the MECHANIC ARTS COLLEGE, Mechanics' Institute Hall, S. F. Reported expressly for the PRESS.]

Carbonic Acid—Its Occurrence.

LECT. II. Feb. 25.—In my last lecture, said the Professor, I spoke about the most common thing in the world,—oxygen. I propose this evening to speak of another common thing, carbonic acid, which, although not so abundant as oxygen, is yet very plentiful and has some remarkable relations to animal and vegetable life.

Carbonic acid is found in the atmosphere, but in minute quantities, constituting about .04 per cent. of it. Carbonic acid is one of the products of volcanic action, and it is often produced in the vicinity of volcanoes, when these are not in action, from some subterranean source. It is produced in connection with many mineral springs, by combustion, respiration, and decay. We find it in nature chemically combined with other bodies and forming solid materials. Marble, limestone, chalk are all composed of carbonic acid and lime.

I called attention in the last lecture to the enormous consumption of oxygen which is going on. Now this consists mainly in its union with carbon to form carbonic acid. Carbon, as you know, is a very common substance which occurs in a pure state as diamond, less pure as graphite, still less pure as anthracite and yet purer as bituminous coal.

There are many simple processes by which we can generate carbonic acid. One of the simplest is this. I put in this jar some marble, a compound, as I just said, of carbonic acid and lime. If now I add an acid, as sulphuric or nitric acid, which has a stronger affinity for lime than has the carbonic acid, it will drive off the carbonic acid and unite with the lime. I add, in this case, hydrochloric acid. This boiling or effervescence which you see, is caused by the carbonic acid rising up through the liquid.

I suppose now that the jar is full of carbonic acid, although I cannot see it, for it is colorless and transparent. It is likewise poisonous. To see if it exists here, I insert a lighted taper which is extinguished, for carbonic acid does not support combustion. As carbonic acid is about once and a half again as heavy as air, if it exists here I can pour it into another vessel and then test this vessel with a lighted taper, or I can hold the taper under this vessel and pour the carbonic acid upon it. The flame, you see, is extinguished. Another and decisive test is to add lime water. The carbonic acid unites with the lime forming a white deposit of limestone.

Carbonic Acid in Bread-Making.

I can get carbonic acid by bringing carbonate of soda and tartaric acid together, or carbonate of soda and cream of tartar, or soda and phosphate of lime. These are substances sometimes used in bread-making to make the dough rise, for this action is caused in such case merely by the generation of carbonic acid gas in the pasty mass, and this gas expands the dough. The use of tartaric acid or cream of tartar, however, is bad because it leaves injurious salts in the bread. We should do better to use carbonate of soda and hydrochloric acid, could we be sure always of having these brought together in just the right amounts, for then we should have formed common salt and carbonic acid. But there is too much danger of having an excess of one or the other of these substances for common use. Carbonate of soda and phosphate of lime are better, for these form phosphate which exist in the blood and bones, and are desirable articles in food, all the more so since the common fine white flour is deficient in this necessary substance, being rejected in this necessary substance, being rejected with the bran.

When we use yeast for bread-making the case is somewhat different. Yeast is a ferment and this acts on the sugar (and on the starch which it converts into sugar) in the flour, causing the formation of carbonic acid and alcoholic compounds. This occasions a loss, for the alcohol is driven off in baking and about one-sixteenth of the flour is thus consumed.

Carbonic Acid in Nature—in Drinks.

Carbonic acid is generated by breathing, by combustion, by decay. In wells or shafts where organic substances decay, it is formed and makes the place dangerous

for people to enter. In the island of Java which is of volcanic nature, although there are now no volcanoes in action, there are basins which are filled with the gas which comes from the ground. As the Upas tree often grows in these basins, it has acquired the reputation of emanating deadly gases, which it does not do, although its sap is poisonous. In volcanic districts there are often caves where the gas, being heavy, flows along the ground, so that a small animal dies on entering the cave, while a man, whose head is above the stratum of gas, can enter with impunity.

Carbonic acid causes soda water to effervesce. But the gas, although poisonous to the lungs, is not poisonous to the stomach. It exists in beer, champagne and all effervescing drinks. The danger from soda water, however, comes from the fact that an excess of carbonic acid causes water to be a solvent of carbonates to a considerable degree, and hence if lead or copper are used in the manufacture of soda water, poisonous carbonates are formed and then dissolved in water. One of the best antidotes is simple syrup, sugar in solution, and this we are accustomed to use in our soda water, which fact undoubtedly explains the reason why more persons are not injured by this drink.

We have examples of this solvent action in nature. The rain gets charged with carbonic acid from the atmosphere, falls to the ground, meets and dissolves some of the limestone, runs to the sea where the limestone is taken up by marine animals and thus coral reefs are formed. Some remains in the water of springs. This solvent action explains the existence of caves in limestone rock. If we heat saturated lime water, we drive off the excess of carbonic acid and get a precipitate of carbonate of lime. Or if we let the saturated solution flow through a large body of fresh water, it gets diluted and limestone is precipitated. So often marble is formed. Carbonated streams flow into large bodies of water, the animals there get the lime which forms their shells.

Carbonic Acid Provides Food for Plants.

We can try another experiment. We pass carbonic acid into this solution of silicate of potash. We get carbonate of potash and a jelly-like mass of silica. This illustrates a natural operation. Carbonic acid will drive off silica from its combination with potash or soda. Now potash and soda occur in the soil and are necessary for certain plants. The carbonic acid takes it from the older rocks (which consist largely of the potash and soda silicates combined with other silicates,) being brought to them by the rain water. It takes out the silicates for the use of plants and leaves the clay, and thus are formed deposits of porcelain clay. When much soda is there, we can see how the alkaline deposits (of carbonate of soda) are thus formed on our interior plains.

Again, this jelly-like silica is slightly soluble in water, and thus it is carried to plants which need it to give firmness and hardness to their stalks. Almost every form of natural water holds a little silica.

One more point may be spoken of here. If we have two gases in contact, one heavy and one light, they will flow together and mix up intimately. It may be remarked that the lighter gas will rush into the heavier much more rapidly than will the heavier into the lighter, the velocity being inversely proportioned to the density. [The lecturer showed this by a very beautiful experiment in the case of hydrogen and air.] This fact and the agitating action of the wind explains why the heavy carbonic acid gas does not settle on the surface of the earth and render life impossible, but is as abundant in the upper as in the lower regions of the air.

NEVADA COAL.—The Humboldt Register has seen some specimens of good coal taken from a vein lately discovered near Argenta station, Lander county.

QUICKSILVER.—Another quicksilver mine has been opened which promises very favorably. It is owned by the Whitton brothers, and located near Sebastopol, in Napa county. A shaft was sunk 115 feet, a tunnel then run 550, a sink again made about 30 feet, when water was struck, with a bed of from four to six inches of cinnabar. The owners have a furnace in full blast, and have obtained about \$2,000 worth of quicksilver.—*Grass Valley Union*.

THE Leyden coal mine, near Golden City, Colorado, is on fire. It was opened and then allowed to remain unworked sometime, when it commenced to burn.

GOOD HEALTH.

SORE EYES.

[Written for the PRESS.]

Those who are not acquainted with the structure of the eye are apt to look upon it as a very small thing, having a single individuality, and therefore subject to a single form of disease. In other words, a sore eye is simply looked upon as subject to no more variations than is a rotten potato. Such persons suppose that all that is necessary to do in the treatment of a sore eye is to apply some kind of eye-water, and if that does not cure, nothing more can be done.

We meet people almost daily who have had sore eyes, varying in time from a few days to weeks or months or, perhaps, years, till their sight is either entirely destroyed or greatly impaired, without making any effort to save it, except simply to make some kind of local application that somebody has told them was "good for sore eyes."

Different Kinds of Diseases of the Eye.

A little review of some of the most common forms of diseases of the eye, it is believed, will be both instructive and profitable.

Conjunctivitis, commonly called inflammation of the eyes, is the simplest form of all the diseases of the eye, and is perhaps more frequently met with than any other; yet, simple as it is, there are more than a dozen distinct varieties, viz.:—Catarrhal, conjunctival, diphtheritic, Egyptian, eruptive, exanthematous, gonorrhoeal, granular, purulent, pustular, scrofulous, simple traumatic, etc. Some of these differ as widely in their nature and successful treatment as do measles and small-pox.

Eyewater may give some of them temporary relief, while with others it would be worse than useless. All are benefitted by medicines taken internally, and some of them can never be cured in any other way.

The conjunctiva has also a great many other forms of disease, except inflammation, to wit: pterygium or a thickening of its substance, cysts in, warts upon, and symblepharon or a "growing together" of the portion which lines the lids to that which covers the eyeball.

It will be understood that all of the above-named diseases belong to the covering membrane of the eye, while the eye itself may be perfectly sound.

The eye itself is subject to a great many forms of disease, all of which have a tendency to destroy the sight; but their detailed description here would be too long and tedious for an article of this kind.

It is perhaps sufficient to say, that the cornea, the iris, the lens, the sclerotic coat, the choroid, the retina, the hyaloid membrane, the vitreous humor and the optic nerve are all liable to a number of separate and distinct affections peculiar to themselves, each having a tendency to either impair or destroy the sight, and each requiring treatment peculiar to itself.

Taking into account the delicacy of the eye, it is a matter of surprise that it really does endure the amount of rough usage to which it is sometimes subjected.

Of all the senses, that of sight is certainly the most pleasing and the most useful. The most pitiable objects that we meet are persons that are blind. Such being the case, it is of the utmost importance to take good care of the eyes, and by all means to keep them in a healthy condition; but if they should become diseased, prudence would dictate that they should never be tampered with, but the very highest order of scientific skill should be employed, without delay, to restore them to a healthy state as soon as possible.

E. J. FRASER, M. D.
San Francisco, February 15, 1871.

ANONING WITH OIL.—When a child, or an adult, for that matter, takes a heavy cold which settles on the chest, or in the throat, or in the head in the region of the nose, one of the first things to be done is to anoint the parts affected with sweet oil. The oil should be heated, which can be easily done by pouring a little into an iron spoon, and holding the latter over the flame of a lamp for a minute, and then rubbed into the skin of the patient with the hand. Do this always at night, and at other times in the day when the case is a severe one. It is a certain relief, and will do not a little toward effecting a cure. Incipient influenza and croup may not unfrequently be warded off in this way.

AIDS TO DIGESTION.

Dr. Marcet writes, reports the *Lancet*, in a pamphlet just issued from the press "On a New Process for Preparing Meat for Weak Stomachs, as follows:—

"I have often thought that, if there were a means of preparing meat, so as to enable its easy digestion by weak stomachs a great boon might be conferred on a very large class of sufferers; and it has occurred to me that by submitting cooked meat to some process similar to that which it undergoes in the stomach, food thus prepared would require but very little effort of the stomach to complete its digestion, and thus the body could be efficiently nourished notwithstanding a debilitated condition of the digestive organs." Hydrochloric acid and pepsine being the principal natural agents for the digestion of meat in the stomach, he has thought that these substances might be applied to digest cooked meat in some degree, previously to its being eaten; and that by giving the stomach animal food thus softened and dissolved, sufferers from diseases of nutrition, causing wasting and emaciation, and who can take but little food, which they have much trouble in digesting, and others miserably tormented with dyspepsia, whose irritable stomachs cannot digest animal food, let it be ever so carefully cooked, might be enabled to take a little meat, and digest it well, the stomach being saved a certain amount of work. The food obtained by the process is a fluid "holding in suspension a light pulpy substance, most of which, when the liquid is allowed to remain undisturbed in a glass, is seen to fall to the bottom; it is in a great measure to this substance that its nutritious properties are due; but the pulpy mass is so minutely divided and so soft, as to be swallowed unperceived." It is a very palatable food, and is said to be acceptable to invalids.

PROPAGATING CONTAGIOUS DISEASES.—Professor E. Lankester says in *Nature* that scarlet fever is the most destructive of all contagious diseases, and that it is often spread by the particles of the skin which peel off from the body as the patient is recovering. He mentions a case where scarlet fever attacked a large number of those who received milk from a particular dairy. It was discovered that those who had recovered from the disease had been milking the cows before the sloughing of the cuticle had been completed. Mr. Lankester insists that a free use of disinfectants will destroy the poison germs. All secretions of the mouth or nose, as well as of the other excretory organs, should be immediately brought in contact with a good disinfectant; and all clothing should either be washed in a disinfectant solution or exposed to heat in an oven.

INGROWING TOE NAILS.—The trouble and pain from this cause can be immediately and permanently relieved, without pain, by filing down thin all the exposed part of the nail, till it is soft and pliable. This will immediately relieve the part pressing into the flesh, which need not be cut or extracted. The filing is not in the least painful as the file will not take hold of the skin or flesh. In the course of several months, the nail will grow out thick again, when the filing should be repeated. The edges of the nail will never grow into the flesh so long as the top of the nail is soft and pliable; and there is nothing so simple, convenient, safe, and painless for keeping it so as a file.

CURE FOR STYES.—Put a teaspoonful of soda in a small bag, pour on it just enough boiling water to moisten it, then put it on the eye pretty warm. Keep it on all night and in the morning the sty will most likely be gone; if not, a second application is sure to remove it. We have heard also that the white of an egg, when applied to the eyelid with a leather just before retiring, soon effects a cure. Styes arise from impurity of the blood, and no permanent cure can be effected by a mere external application. The blood should be kept in a healthy condition by the frequent use of some mild purgative—say a dose of rhubarb and magnesia.

A YOUNG man named Regan died in Albany recently from a mole or wart on his face cut by a razor while being shaved. The wart was on the left cheek, and, while the whole right side was paralyzed, the left leg and arm became rigid, and the face turned over the left shoulder.

AFTER all, there are only two sorts of disease, says a French doctor—one of which you die, and the other you don't.

Good Health remarks that what people call "bile" is generally lobsters, clams, or some indigestible food.

Gold and Legal Tender Rates.

San Francisco, Wednesday, Mar. 1, 1871. Legal Tenders buying @90%; selling @91. Gold in New York to-day 110%.

Table of Contents.

Harvesting Machines, Ill.; Iron Ore in Wyoming.....	129
MECHANICAL PROGRESS.—Barron Steel Process; Four-Cylinder Locomotive without Oscillation; English vs. American Woollens; Naylor's Brake; Sherman Iron Process; Effect of Cold on Iron and Steel.....	130
SCIENTIFIC PROGRESS.—Genesis of Species; Ball Lightning; Continuity of the Chalk; Bastain vs. Frankland; Acoustic Studies of Flame.....	130
Notes on Tuolumne County; Banner District, Cal.; Smelting Furnaces in Inyo County, Ill.; Colorado Oil Wells.....	131
MINING SUMMARY; Mining Stock Market; Shareholders' Directory; Market Rates.....	132, 133
List of Patents; Notices of Recent Patents; Poultry Notes, Ill.; Agriculture in Montana.....	134
Chemistry and Its Applications; Good Health.....	135
Journalistic Jocularities; Mining Swindles.....	136
Familiar Scene in Pompeii; Horticultural Society; Ramie.....	137
HOUSEHOLD READING.—Mixed Dishes; Wood in the Kitchen; New Bread; Domestic Receipts; Mechanical Hints; Life Thoughts, etc.....	138
Diamonds in Trinity County, Cal.; A Rocky Mountain Canal; Mad-stones.....	140

MAD-STONES.—The faith in the virtue of mad-stones, or poison stones, says the *N. Y. Times*, for neutralizing the effect of snake bites, dates back for centuries, coming to us from the East. The monks of Manila carry on quite a lucrative trade in their manufacture, supplying the merchants of India. The snake charmers of the Malabar and Coromandel coasts likewise prepare them, but only for themselves, preserving their composition as a secret. In Mexico, similar stones have been mentioned by travelers. An experience during a four years' residence in India gives the writer but little faith in the efficacy of the stones. The method of applying the snake-stones is as follows:—A bandage is tightly placed above the wound; the stones are then applied; they attach themselves closely, imbibing, by their porous texture, the blood that oozes from the bite. The stones will adhere from two to ten minutes, the length of time depending on the amount of blood that issues from the wound and their capacity for absorption. A bandage is not always applied; compression with the hand, or rubbing the affected part downward is said to answer. Before again using the stones, they have to be washed and well dried, perhaps subjected to great heat.

THE Colorado weekly *Register* comes to us enlarged in size and by no means deteriorated by its sudden growth.

GEORGETOWN, Colorado, is going after a railroad. We hope that the people there may get one. It will be of the greatest value to the mines.

A GUAVA TREE.—William Patterson, a nurseryman of Sacramento, says the *Record*, has a guava tree growing in open air, which is loaded with fruit. It has been bearing for the past four years.

NEW GRIST MILL.—W. B. Clarke is about to erect a grist mill at Railroad Flat, Calaveras county, at which point he owns a fine water power.

ILLINOIS has more miles of railroads than any other State, but the cost of her roads and equipment was less than of those in Pennsylvania.

ANNEXATION.—Efforts are being made to bring about the re-annexation of Walla Walla county, now in Washington territory, to the State of Oregon.

MISSOURI has given up hopes of finding tin ore in paying quantities.

Mining Swindles.

Every now and then, we receive letters asking information concerning mining properties from individuals who have been induced to invest in stocks. In too many cases we are obliged to answer that the enterprises are but swindles. The fact that there are so many hogus mining operations harms legitimate mining enterprises in a very high degree, and redounds to anything but the credit of our miners. We can only warn people that, in investing in mining stocks, they must use as much discretion as in any business operation; and give force to the warning by exposing swindles as far as is in our power.

One of the last cases was with regard to the Garner gold mine, of Tuolumne county. A lady of Manchester, N. H., wrote us for information concerning the mine, and we put a query in the Press. The *Southern Democrat*, of Feb. 25th, answers us fully, thereby doing an act which deserves high praise. Some persons, strangely enough, imagine that, for the sake of the reputation of the section in which they reside, all *exposés* of swindling operations, there carried on, should be suppressed, and often it is difficult to get at the facts of such a case. This is a most mistaken notion. The *Democrat* will please receive our thanks for its reply, which reads as follows:

Garner Gold Mine.

THE SCIENTIFIC PRESS of last week has a paragraph in relation to this mine, asking if it is a swindle, setting forth that "Mrs. S. T., 222 Chestnut Street, Manchester, N. H., having spent considerable money on stock of the Garner Gold Mine, on the main Tuolumne river Tuolumne county, California, desires to know whether the affair is a swindle." So far as Mrs. S. T. is concerned, it amounts to a swindle, her stock is utterly valueless. The original locations and owners of this mine, in 1869 and in 1867, prospected the vein to a limited extent, finding good prospects. In 1867, a company was formed and incorporated in Massachusetts, that entered into a contract with the original owners, to build a ten-stamp mill and develop the mine for a one-half part of it. The original owners to retain one half not subject to assessments. The incorporated company, for the one-half, issued stock which was bought and sold in Massachusetts. A superintendent and a managing agent was sent here to develop the mine and make necessary improvements. For a time everything went on swimmingly, there appeared to be no lack of money to do anything the managers wanted to do. A very good ten-stamp mill was completed while some work was done on the vein. About the time the mill was finished, the workmen not being paid as promised, liens were filed against the property. The manager and superintendent brought suit against the company for services. The liens were foreclosed, the agents obtained judgments, and the property was sold at Sheriff's sale, leaving the stockholders, with the original owners out in the cold. The mine has not been developed, the company lost its grip before reducing ore. The whole thing appears to have been gotten up that a few should have a "good thing" at the expense of trusting stockholders in the East. Near as we can learn, twenty thousand dollars or more were sent here by the stockholders, of which amount, one-half was needlessly squandered in extravagance for fine horses, hotel living, and passages to and from the East and travelling expenses. No one can tell the value of the mine; it is not opened sufficient for any judgment to be formed. This is but one of the many projects of the same piece of cloth in this country. The parties who took stock, paid large amounts for expenses having a very remote connection with the improvement of a mine. The original owners have lost their property and Mrs. S. T. may as well make up her mind under such circumstances, that her stock is worth only the value of the paper it is written on. We regret such is the fact. This way of conducting mining operations results in great injury to the reputation of our mineral resources, but so long as schemers and speculators can induce unsuspecting people to furnish money for them to squander in developing mines at liberty, so long we must suffer from operations similar to that of the Garner Gold Mine.

Journalistic Jocularities.

Those who are personally acquainted with the editor of the *Grass Valley Union*, know how fond he is of his joke, and how he will indulge in flights of humor on the least provocation. He is apt, however, at times, to veil his wit in such language that persons who are not very well acquainted with him are sometimes at a loss to know whether he is really joking or whether he is in earnest.

It is decidedly unpleasant to be obliged to explain a joke, a thing which is at times necessary to prevent misunderstanding. We feel that it is our duty in the present case to perform this task, because we have the reputation of interior journals at heart, and would not have it thought that the editor of a paper published in a mining region like Grass Valley, was entirely ignorant of matters pertaining to mining.

The jocularity to which we now refer, was occasioned by an article in the Press, entitled "A Co-operative Gold Mine," reprinted from the *London Gentleman's Magazine*. The editor of the *Union* pounced on the article and subjected it to a series of witty remarks. Of course, he meant it merely for a joke. The chief point made was that it was comically absurd to think that 26½ men could be at work at once in a small shaft. To be sure, this fact was nowhere mentioned in the article, only the statement was made that the company consisted of 80 men, who were divided into three shifts and worked night and day for three years. But our friend saw the opportunity for fun and went for it, adding that "the great time (169 weeks) consumed (in sinking the shaft between 300 and 400 feet) was probably because the men were packed so tightly in the shaft that they could not work." The joke is good, although not so bold as the statement which follows, that "these men worked on their own shaft and not off at other places part of the time as co-operative miners in those parts are wont to do," a statement which was entirely original with the joker, and consequently not given as a fact to be believed.

Now a serious-minded individual might think that the editor of the *Union* believed that all that is necessary in sinking a shaft is to dig in the bottom of the pit; that he was ignorant of the fact that the dirt must be raised to the surface, and that men must be employed for this purpose; that there is generally water to be pumped out, that timber must be cut and prepared for supporting the sides, that there are a thousand and one different things to be done in connection with sinking, so that only a part of a shift is ever in the pit, especially when a great work is being prosecuted; that it is a very common thing for a portion of the co-operators to work elsewhere in order to supply the means for carrying on the work, etc.

Now the editor of the *Union* knows all this to our certain knowledge. We should not be surprised if he likewise knew that in the early days of mining in Australia, a certain number of shareholders in such an enterprise were obliged to go themselves into the "bush" to cut the necessary timber and then to haul it to the mine. Mr. Shoemaker isn't so entirely ignorant of mining matters as not to be aware of these things, although his article might lead some unsuspecting persons to imply it. And as he seems to have a praiseworthy interest in the reputation of the senior editor of the Press, we cannot but reciprocate, and therefore give this explanation in his favor.

Nor is that gentleman so provincial as to imagine that, because a number of co-operative mining operations are carried on around Grass Valley, co-operation is fully appreciated every where in the mining regions, and that co-operation is as extensively practiced everywhere as it ought to be. He has undoubtedly read letters in

the Press and other papers asserting that the thing is impossible. Again, we imagine that he would not think it useless to advise and stimulate men to continued honesty and industry, for example, even in an honest and industrious community.

The editor of the *Union* does have an awful tendency for jokes. In the very next issue of that paper following the one in which the article alluded to occurs, he gets off a whole column of serio-comic matter on "magnetic motive power." He clips a tragic article on a wonderful electric machine which creates an immense amount of power, said machine being the invention of a gentleman (unless we are greatly mistaken) who flourished some twenty years ago in Massachusetts for a glorious but brief season, during which he showed that water could be decomposed wholly into hydrogen or wholly into oxygen at will, that turpentine could be burned an infinite length of time without being consumed, and a variety of such wonders. The *Union*, in using the electric machine articles adds characteristic remarks:—that "late experiments prove that electricity, or the galvanic current, can be made to run machinery up to any wanted horsepower * * * that the power of the electric machines can be indefinitely increased. * * * The results will be wonderful and will revolutionize machinery. The stamps and all the amalgamating machinery of the Eureka mine can then be run day and night and from year to year by a battery in the superintendents' office, which will not occupy a space larger than a writing desk." We presume that it is the battery, and not the superintendents' office, which is to occupy the small space mentioned, and only wonder that it was not added that the battery would be gradually decreased in size until no larger than a mustard seed, and finally he done away with entirely.

But these are only Brother Shoemaker's jokes. That gentleman, however, has no right to imagine that every one understands him as well as we do. Consequently, he ought either to make his jokes clearer or else to add, as A. Ward was wont to do, "this is a goak."

A VERY USEFUL DEVICE.—We have been shown a working model of a very ingenious and useful apparatus, invented by Mr. Louis M. Clement, one of the engineers of the Central Pacific. This is a self-registering speed indicator, and consists, in brief, of a revolving cylinder, driven by clock-work, and so arranged and constructed in combination with a marker, actuated from the action of the car-wheels, that dots are made on a sheet of paper, placed around the cylinder, at regular distances passed over by the train, while at the same time the lapse of time is given by lines drawn on this paper. In this way is obtained a complete record of the speed of the train, and the number and length of stoppages; so that the managers of the road cars always know whether the engineer has performed his duty in regard to running on time, etc. If, for instance, the engine-driver makes too long a stay at one point and then tries to make up for lost time by running at an extra speed (a fruitful source of collisions and other accidents), this is unerringly shown by the simple device. We saw a record of a trip from Oakland to Ogden kept in this way. In this case, in starting out from Verdi, a freight train was met, and the train to which the apparatus was attached was compelled to back four-fifths of a mile and then to lie over for some time, but arrived at its destination on time. The office at Sacramento was not notified of the fact, as should have been done, but the record showed the delay and stoppage, which led to the discovery of the real state of affairs. We believe that such a device would be most useful for railroad trains, and will prove a great safeguard against accidents. A patent has been applied for through the SCIENTIFIC PRESS Patent Agency.

A Family Scene in Pompeii.

Pompeii was a small city. It contained only about thirty thousand inhabitants. It was beautifully situated, however, in a picturesque valley, and attracted many persons of distinction. It had a considerable trade but, on the whole, enjoyed no special prominence in ancient history.

Sixty-three years before Christ, a violent earthquake shook the city, ruined many of the buildings and drove almost everybody from the place. The people returned after awhile and went vigorously to work to rebuild the city. Very much had been done, temples had been finished, private residences completed, business and pleasure had resumed full activity. A crowd was assembled in the amphitheater on November 22d, 79, to witness a gladiatorial display, when there occurred a terrible eruption of Vesuvius. A deluge of dust is thrown over the city. The people rush hither and thither, some out of the city, some to seek shelter in the shops, under the theaters and in underground retreats. But there comes a deluge of fiery stones and ashes which fills the streets, breaks down the roofs, enflames the houses, and when the eruption had ceased, the city was buried.

Some attempts were made to recover valuables by excavating, and the Emperor Titus sent senators to see whether the city could be restored, but nothing of importance was accomplished and gradually vineyards, orchards, gardens and forests covered the ground and Pompeii was forgotten for centuries. In 1748, some vine-dressers, in digging, unearthed statues, and excavations were made, but it was eight years longer before any one suspected that it was Pompeii that was being exhumed. The work was carried on slowly and with interruptions, until, in 1860, it was resumed with activity, and since then very much has been accomplished. Pompeii is again being brought out to the sight of man, and about one-third is now unearthed. In these excavations, not only are the buildings exposed and the various household utensils, etc., etc., discovered and saved, but even the bodies of the inhabitants or rather the forms of their bodies. The smaller articles, which might be stolen, are placed in a museum at Naples.

A number of years ago, a Belgian artist, Coomans, visited the place and was so struck with its beauties that he devoted himself to delineations of antique life. A copy of one of his most charming works is here given. He has examined the city and the Museum at Naples, and has thus been enabled to re-construct a scene as well as if from actual life. One or two points illustrated by this picture, may be spoken of here.

The dress of the women, as can be seen, was of a rather light description. The complete costume consisted of three parts, a simple shift, worn next the skin, a tunic, sometimes with short sleeves, which, however, generally covered only the upper part of the arm and were not sewn together but fastened over the shoulders by means of clasps, and a long flowing outside garment for wear out of doors. The tunic was confined around the waist by a band, which was concealed from view by the folds of the upper part of the garment.

That of the lower classes reached only to the knee, showing the ornaments on the legs; but the higher classes wore tunics reaching to the feet. Sandals were worn in the house, and booties in the streets, both being often of bright colors and highly ornamented.

Fine long hair was highly prized. There were various methods of dressing it. The simplest way was in smooth braids with a knot behind, but sometimes a storied edifice was used. To keep the hair in place, bands and pins were used. Often at night, or when busied with household affairs, nets, frequently of gold thread, were employed. Ornaments were worn in the hair, on the arms and neck and even on the legs. The Pompeian ladies seem to have been

for further description. Our engraving is not taken directly from the original painting, but from one of Prang's fine chromolithographs. This and other chromos can be obtained of Messrs. Snow and Roos, 21 Kearny street, San Francisco.

Horticultural Society.

A regular meeting of the Bay District Horticultural Society was held last Saturday evening, when nine new members were elected. Following are the leading questions for discussion in the Society at the present:

First—Which are the most suitable forest trees for California?

Second—Which are the best evergreen shade trees?

Third—Remedy for the mealy bug?

Ramie.

Quite a number of persons in different parts of the State, are experimenting with the cultivation of the Ramie, on account of the prospects it holds out for large profit. The ultimate success of the business, however, does not depend so much upon the facility of its cultivation, as upon the economy of the preparation of the fibre for market. Much has been said about certain machines which have been invented in the East, by which its preparation is said to be easy and cheap; but nothing of the kind has yet been seen on this coast. Under these circumstances several parties interested in the cultivation of the plant, in Alameda county, are said to have combined and sent a gentleman—Mr. Gilbert Lyman—to New Orleans, to personally examine the machines and look carefully into the method and success of their operations, and report to his correspondents here. Mr. L. has sent back the following report:—

I found Lefranc's machine at work on the stalks of Ramie raised in Louisiana. It turns 600 pounds of clean new fibre per day—doing its work with ease and perfection; I send you samples. This is an improvement on the first machine by this maker, and they cost more. The price is \$500, if boxed for shipment. It goes by hand or steam power. It has made a revival of interest among the planters, and there will be a large increase of production.

Mr. Lyman advises the Alameda farmers to cultivate ramie as extensively as they can, expressing the opinion that when they have the machine, they can make money faster than by any other crop. The plant may be cleaned in the field, where it grows, and it is calculated that from and after the second year of its growth, it will yield two tons to the acre, valued at from \$75 to \$100 per ton. The inducement held out is certainly a large one; but we should not advise any one to go very extensively into the speculation, until a machine is put up in this State, and its practicability fully demonstrated here. We have suggested several times that those persons extensively engaged in cultivating the plant for sale, for propagation, should unite in purchasing a machine for this State by which an ocular demonstration may be given here. When that is done we shall take much pleasure in making the fact known. If such an experiment should prove successful we see no reason why

the cultivation and preparation of ramie should not become an important industry in this State. There is no question about the demand for the staple, both at home and abroad.

BEWARE OF ORCHELLA.—J. A. Bauer having been requested to send a lot of orchella from Lower California, to Germany, made an assay or examination of it and found that it was worthless. He had no information whether it is different from that already shipped from Magdalena Bay. Speculators in it should be careful to gather only that which promises good coloring matter.

GROWING GRAIN IN DANGER.—Mr. John Powell, who has a farm about one mile east of Petaluma, says the fields of young grain in his vicinity are being greatly damaged by a small insect, which is eating up the growing blades. He has hopes, however, that the rain may destroy this insect.

A FAMILY SCENE IN ANCIENT POMPEII.—BY P. O. J. COOMANS.

very fond of ornamentation of their persons. Evidently the dress of the children was very simple.

The houses were sometimes finely decorated with pannellings. Carpets were not used, but we see here a tessellated pavement. The household utensils were varied in form, often of the most complex and beautiful manufacture. The engraving shows a handsome candelabra on the table and one on the floor near the fountain. Oil-lamps were in universal use, and notwithstanding their elegant forms, they were imperfect as regards combustion, for the ceilings were blackened with smoke. The dwelling rooms opened out into a central court, and, at least, in the lower stories, the buildings did not have many openings into the streets.

By examining the engraving other points in the domestic economy of the ancients will be discovered, but we have no space

Fourth—The destruction of insects injuring our vegetables and other produce?

Fifth—Which are the best varieties of roses for California?

Sixth—Which are the best house-plants?

The Society is desirous of obtaining all possible information on these subjects and solicits communications from parties interested in various localities of the State. Communications may be addressed to F. A. Miller, Secretary of the Society. Post office box, No. 418 Kearny street. Whenever the Society has come to any conclusions on these subjects they will be laid before the public.

WINE CULTURE IN FRANCE AND PRUSSIA.—In 1869, about 47,872 acres of land in Prussia were planted with grape vines; in France, 6,018,000 acres were thus covered. The value of the Prussian crop was about \$1,968,750; of the French, about \$426,000,000.

FORT WALLA WALLA is to be sold, says the Walla Walla Union, probably for the benefit of the Northern Pacific Railroad.

HOUSEHOLD READING.

Mixed Dishes.

Simple food is always the easiest to digest; but when people will mix up different meat dishes and highly seasoned, they should always be freely mingled with such things as celery, cauliflower, spinach, lettuce, and such easily digestible vegetables; for these, taken with concentrated food, give lightness and porosity to what is eaten, so that it can be more readily attacked and assimilated by the digestive fluids. Each dish of meat should be served with some pleasant acid. Oysters and fish should be flavored with sections of lemons; mutton may be garnished with a little currant jelly; roast beef or turkey or chicken should come to the table with celery salad, and so on through all the mulifarious rounds of meats.

A celebrated French cook, once declared he could give a dinner with which not even the most fastidious epicure could find fault, and yet one from which no symptom of indigestion would arise, though hours were spent at the table, and rest in sleep sought immediately after. His combination of dishes was much like that above described.

Though a call for such a dinner as we have suggested might throw the ordinary cook into utter despair, still there are many valuable hints and suggestions which may be gleaned therefrom by the prudent and thoughtful housewife. Apples, a little acid and well baked, are cheap, easily prepared, and form a most palatable and healthful accompaniment for meat; so does cranberry sauce. Cold slaw made from well chopped cabbage is a very good substitute for celery and so is lettuce, in its season.

As we said, at the outset, simple food and plain dishes are the most healthful and nutritious. A single variety of meat, with not more than two kinds of vegetables is always better than more; a nice baked apple (a recipe for preparing which is elsewhere given,) or a slice of nice light, white, or graham bread, with good sweet butter, forms a better desert than pie or pudding—if we can only be brought to think so.

How OILS EXPLODE.—The expression often used that oil is explosive conveys a wrong idea. The oil does not explode. An oil may even extinguish a burning match when thrust into it, and yet be highly dangerous as a burning fluid. It is the vapor of the oils, mixed with the air, that is dangerous, as far as explosion is concerned. Where a partly filled lamp has the portion above the oil filled with a mixture of vapor and air, it may explode. When a lamp is filled, while lighted, the mixture of air and vapor in the can or filler explodes upon coming in contact with the flame; the oil itself does not really explode, though it does serious injury when scattered by the explosion.

The poor invalids who visited Congress Hall, at Saratoga, last summer, consumed thirty-nine thousand chickens, thirty thousand dozen eggs, fifty-nine thousand pounds of beef, forty thousand pounds of lamb and mutton, nine thousand pounds of veal, fifteen hundred turkeys, and of other fowls five thousand.

After reading the above, one can but hope that they now "rest from their labors!" And we question whether or no some of the healthy invalids who flirted, painted, powdered, and dressed to amuse and astonish their invalid friends, will not, the coming season, be fit subjects for a share of the invalid diet? In plain words, does not the eating of such food, make and keep our people invalids.—*Jewell.*

How to BROIL WITHOUT BURNING.—In broiling a beef steak, whenever the coals blaze up from the drippings, a pinch of fine salt thrown upon them will instantly extinguish the flames. By carefully attending to this matter, you may have your broiled steak or chicken, crisp but not scorched, and juicy, yet well done.

Wood for the Kitchen.

Never use green wood in the kitchen. There is a saving of from one-quarter to one-third of quantity in using dry wood, according as the wood is more or less thoroughly dried, to say nothing of the saving of time and temper. If thoroughly dried the latter is the correct figure. There is no simmering with dry wood; but a brisk, cheerful fire, which never goes out till you have done with it. Then again you can always have a bed of bright, live coals, for broiling, or any other purpose, instead of the dead, smoking embers which result from burning green wood.

With dry wood your meals may always be served promptly; while cheerful faces and bright eyes enliven the kitchen. With green wood you can never depend upon your fire; the room is always full of smoke and unsavory odors which find their way into your hutter, your cream and your milk, and the whole house is more or less affected; while everybody is cross and ill-natured with smarting, and blood shotten eyes.

In the one case, all are bright, pure and happy; in the other everyone is glum, morose and miserable.

This is no exaggeration. A smoky room and a cold room is the abomination of everybody. The reader's experience and observation will fully bear us out in what we have said.

The remedy is easy—simply cut or get your wood ahead, and keep it under cover in wet weather. The farmer who cuts his wood from the forest or riverside, should always keep at least a year's supply ahead; haul it home and cut it up at your leisure; but don't pile it close until it has become thoroughly dried and aired. Wood should never be kept in a close place, even if dry, for it will gather dampness, unless well ventilated, and in such condition will burn "dead," and without the brightness of flame so pleasant and desirable. Young wood is much better for fuel than old, large forest timber, even though the latter be vigorous and growing well when cut.

NEW BREAD.

New bread is not unwholesome if properly made. It was prescribed in former times, when bread was honestly made. In England there is so much inferior flour that great adulteration is induced to give whiteness to the loaf. In Paris and Vienna bread is always eaten fresh and no evil results. French bread is mostly crust. The secret of its excellence is in using the least amount of yeast and the greatest manipulation. Machinery is largely employed to insure thorough mixing, so that "a little leaven leaveneth the whole lump." The best mortar is made by sparing the lime, fining it to dust, and mixing it so effectually that every particle of sand gets a touch of lime, there being no excess in places and deficiency in others. So it is with breadmaking. The more you knead the dough the more you ripen the mass and the smaller is the quantity of yeast required. It is affirmed by the journal of *Good Health* that when bread is thus ripened in the dough it may be eaten fresh without any fears of indigestion. That journal is not partial to stale bread. The stomach does not crave it, and nature pronounces against it. Every cook knows the difference between shortcake well kneaded and that which is made hastily. The one is crisp, tender and digestible; the other is tough and dyspeptic. In California there is no excuse for adulterating flour and using alum to whiten inferior grades.

NUTRITIVE VALUE OF BRAN.—A writer in the *Country Gentleman* gives the following valuable information on this subject.—Rye and wheat bran contain nearly one and a half as much albuminous substance as flour, twice the quantity of fat of the whole grain, three times that of phosphoric acid and potassa, and four times that of magnesia. The breeder and stock-raiser thus possesses in the bran a fodder that surpasses rape and linseed oil cakes in nutritive value. How highly these are estimated is well known. By mixing bran with straw and hay, which are deficient in phosphates, a most nutritious fodder for young and milking cattle may be made.

Domestic Receipts.

TO BAKE APPLES.—Take out the cores and fill or partially fill the cavities with crushed sugar; place the apples, so prepared in a deep dish or tin, and pour hot (not cold) water in the tin; bake in a quick oven, and you will have baked apples that are delicious.

MASHED POTATOES.—If potatoes served to the table mashed, are first *baked* instead of boiled, as is the usual custom, they will be found far more white and mealy, and of a delicate delicious flavor. The improvement in the dish is well worth the extra labor.

APPLE FLITTERS.—Beat three eggs, the yolks and whites separately, add the yolks to the milk, and stir in the whites with as much flour as will make a batter. Have ready some tender apples, peel them, cut them in slices around the apple, take the core carefully out of the centre of each slice and to every spoonful of batter lay in a slice of the apple, which must be cut very thin. Fry them, in hot lard, to a light brown on both sides.

CUSTARD CAKE.—Two cups white or light brown sugar, three of sifted flour, half a cup of butter, three eggs well beaten; boil all in which is dissolved one small teaspoonful of saleratus, and two teaspoonful of cream tartar mixed with flour. Bake in four jelly tins.

Custard for the Cake.—Boil half a pint of milk with four table-spoonful of corn starch with some cold milk, enough to wet it smooth, and three eggs well beaten; boil all five minutes. Have one pound of shagbarks blanchd with boiling water, and stir them in after the custard is strained and cool. Almonds can be substituted for the walnuts. When the cakes are cold, add the custard between them. One can make two cakes of two layers, or one with four. If two of the whites of the eggs are left out of the cake, and frosting made of them, its appearance is much improved.

RICE DUMPLINGS.—Put your rice in a stew-pan, and pour on each cup of rice one gill of milk; stand it near the fire where it will keep hot, but not boil. As soon as it has absorbed all the milk, pare your apples, take out the cores, and put your rice around them instead of paste. Boil them until the apple is soft. They should be tied in dumpling cloths.

A GOOD IMITATION OF COCONUT PIE.—Grate raw, sweet potatoes into custard, making about an equal quantity of each, and bake quick in a hot oven.

WINE SAUCE.—One and a half cups sugar, half cup of butter beaten well together, then add a glass of wine, two table-spoonful of flour, wet with cold water, to prevent lumping; then add a tea-cup of boiling water and let it stand a few minutes on the stove, then pour it in the butter and sugar and heat it up; grate some nutmeg in it and serve hot.

Mechanical Hints.

A VALUABLE COMPOSITION.—Dr. Scherzer, an Austrian official at Pekin, has sent to his Government some specimens of a Chinese composition called "Schioicac" which has the property of making wood and other substances perfectly water-tight. He says that he has seen in Pekin wooden chests which had been to St. Petersburg and had come back uninjured, and that the Chinese use the composition also for covering straw baskets, which are afterward employed for carrying oil long distances. Card-board when covered with the composition, becomes as hard as wood, and most wooden buildings in Pekin have a coating of it. It consists of three parts of blood, deprived of its fibrine, flour of lime, and a little alum. If the composition alluded to actually possesses the properties ascribed to it, it is certainly very valuable.

CLOSING CRACKS IN STOVES.—It may be convenient to know a ready method of closing up cracks, which are not uncommon, in cast-iron stoves, and we are assured that the following recipe is a reliable one. Good wood ashes are to be sifted through a fine sieve to which is added the same amount of clay finely pulverized, together with a little salt. The mixture is to be moistened with water enough to make a paste, and the crack of the stove filled with it. This cement does not peel off or break away, and assumes an extreme degree of hardness after being heated. The stove must be cool when the application is made. The same substance may be used when setting in plates of stove, or in fitting stove-pipes, serving to render all the joints perfectly tight.

Life Thoughts.

The best consolers of human hearts bear broken hearts in their own bosoms.

It is better to endow one man, who will work as the Father works, than a hundred charities.

The essence of a kiss, as of a contract, is consent; without that it is not a kiss—it is an insult.

PRINCIPLES believed will add fiber to the soul; but sentimental cant clogs the soul with dead matter.

The Sabbath does not stand on argument alone, but on the everlasting want of the human soul, of a seventh day's rest.

If the proud man could only see the vacancy his death would make, he would not be so vain of the place he occupies in life.

If you study history, you will find all great actions, whether had or good, in the periods of transition from one state to another.

The violet grows low and covers itself with its own leaves; and yet of all flowers yields the most delicious and fragrant smell. Such is humility.

If prayer does not cause us to leave off, sinning will soon make us leave off praying.

"CULTIVATE not only the cornfields of the mind, but the pleasure grounds also," was a motto of Dr. Whateleys.

HAPPINESS grows at our own firesides, and is not to be picked up in the stranger's gardens.

MOONLIGHT is like a ladder over which thoughts and prayers may glide to heaven. When there is love in the heart, there are rainbows in the eyes, which cover every black cloud with gorgeous hues.

Any feeling that takes a man away from his home, is a traitor to the household.

The more important an animal is to be, the lower is its start. Man, the noblest of all is horn lowest. The next thing above a man is an angel.

FLOWERS are the sweetest thing God ever made, and neglected to put a soul into.

BE A MAN.

Foolish spending will ever be found to be the father of poverty. Do not be ashamed to work, and of hard work. Work for the best salary or wages you can get, but work for half price rather than be idle. Be your own master, and not let society or fashion swallow up your individuality—hat, coat and boots. Do not eat up, or wear out, all that you earn. Compel your selfish body to spare something for profits saved. Be stingy to your own appetite, but kind to other necessities. Help others, and ask no help for yourself. See that you are proud. Let your pride be of the right kind. Be too proud to be lazy; too proud to give up without conquering every difficulty; too proud to wear a coat that you cannot afford to buy, too proud to be in company that you cannot keep up with in expenses; too proud to lie, or steal, or cheat; too proud to be stingy.

PLEASURE.—What we need now in life, above every thing else, is Christian men who take the lead in manly pleasures and make them honorable and noble. Pleasure is of God. So is suffering. Joy and sorrow are both of them born of God. There is a manly way of enjoying one's self which is not only permissible, but most wholesome, and, in moral things, most beneficial. Let men be free to take all rational amusement, free to take joy, and that abundantly; and yet the moment pleasure and its permissions become soiled or even sullied, let men turn away from them, and loathe them, so that the world, looking on them, shall see that they are "men of pleasure," not in the sense that they are men of eminent conscience.—[*Beecher.*]

DUTY is a stimulant that never fails. Be the disappointments of life what they may, duty puts a blue sky over every man. Men have tried all means to drown the heart's bitterest disappointment—the wine-cup, the suicide, the forgery, the abandonment of all worldly and religious restraint, but none has had such a soothing and stimulating power as the sense of duty.

It is not work that kills men, it is worry. Work is healthy; you can hardly put more upon him than he can bear. Worry is rust upon the blade. It is not the revolution that destroys the machinery, but the friction. Fear secretes acids; but love and trust are sweet juices.

FIND fault only when you must, and then in private if possible. The blamed are less inclined to resist when they are chided without witnesses; and the accused may be impressed with the forbearance of the accuser.

Business Cards.

A NEW PATENT.

If you want a superior set of **TEETH** on Gold, Rose-Pearl, or Pyroline, that will not loosen while masticating, call on **DR. BEERS**, 109 Montgomery street, opposite the Occidental.

MAN AND WOMAN, Considered in their Relations to each other and the World. By Henry C. Pedder. New York, Samuel R. Wells, Publisher, 1870. 8vo. pp. 116. For sale by A. L. Bancroft & Co., S. F.

This is one of those books which are now coming in numbers before the public, as the question of the social relations are pressing themselves on the attention of the people. Gibbons (we believe) said that civilization appears favorable to all virtues except chastity, a statement that has many plausible grounds, although perhaps not to be taken as a necessary, or even an actual, truth. Mr. Pedder, in this book, seeks to induce a careful survey of human nature as the only correct basis on which to rest our social hypotheses. We give one short extract which seems to us worthy of attention.

"As immortal beings, it is disgraceful for us to suppose, as many apparently do, that we are placed in this world merely for the gratification of our appetites and the propagation of the human race. True, there are certain conditions with which this view of the matter may be surrounded, which are calculated to suggest to us much that is beautiful and true concerning the ends for which we were created; but to confine our ideas to this purely carnal view is low and groveling in the extreme. The more comprehensive the mind of the student, and the more perfect his knowledge both of nature and revelation, the more evident it must be to him that the main purpose of the Almighty in the creation of the universe was and is the formation of a heaven out of the human race."

MINES AND MINING OF THE ROCKY MOUNTAINS, the Inland Basin, and the Pacific Slope. Comprising Treatises on Mining Law, Mineral Deposits, Machinery, and Metallurgical Processes. By Rossiter W. Raymond, U. S. Commissioner of Mining Statistics. New York. J. B. Ford & Co., 1871. Price \$4.50. For sale by A. L. Bancroft & Co., S. F.

We have previously (Dec. 10, 1870,) spoken concerning this work. It comprises a description of all the gold and silver mining districts of the West; a discussion of the laws affecting their titles; an essay on mineral deposits in general, their occurrences, characters, and classification; twenty-seven chapters, profusely illustrated, on the mechanical appliances of mining and on metallurgical processes; and an appendix, with valuable tables of statistical information. Three alphabetically arranged analytical indexes, one of Mines, one of Mining Districts, and one of Subjects, complete the work.

NOTICES OF MINING MACHINERY AND Various Mechanical Appliances in Use, chiefly in the Pacific States and Territories, for Mining, Raising and Working Ores, with Comparative Notices of Foreign Apparatus for similar Purposes. By W. P. Blake. New Haven, Conn. C. C. Chatfield & Co., 1871. For sale by A. L. Bancroft & Co., S. F.

This is a re-print of that portion of Commissioner Raymond's report which was written by Prof. Blake. It treats of a subject of the highest importance to miners, and one which has heretofore not been given, as a whole, in any work within the reach of the general mining community.

Prof. Blake is well-fitted for such a work as this and has succeeded admirably well, especially when we consider that his time was limited, and only the intervals between other daily duties could be devoted to the work. The notices were written in the winter of 1869-'70, and since the manuscript was handed to the printer, considerable has been done in the way of improved machinery on our coast. But this does not lessen the value of what is there described and given.

The work contains chapters on the Manufacture of Mining Machinery in California; Breaking Down Rocks and Ores; Boring and Excavating by Machinery; Transportation, Ventilation, etc.; Breaking, Crushing and Grinding Ores; and Separation and Concentration. It is profusely illustrated and can safely be recommended to our mining public.

FENCE LAWS IN ILLINOIS.—The Legislative Farmer's Club, of Illinois, is an Association designed to assist the law makers, by presenting them with the views and wishes of the Agriculturalists. Foremost in the abolition of fence laws, which eat up the farmer who bears the great burden of taxation. It is recommended that stockmen be obliged to fence in or otherwise herd their cattle, or pay whatever damages their strays inflict by plundering the farmer's crops. The Club advises a tax of one dollar on dogs, male, and two dollars on females, and that dogs uncollared be without the protection of the law.

Diamonds in Trinity Co., Cal.

The Trinity Journal, of Feb. 25, has the following:

"The possibility of diamonds being found in this county has been suggested at different times by scientific men. Not long ago, we listened to a narration of how what was in all probability a diamond of great value, was found in this basin and, through ignorance of its real character, afterwards mislaid and lost. Several years ago, Mr. I. Woodbury, while mining the red flat above Garden Gulch, found a singular looking stone in his bedrock ditch and picked it up. As it lay in the ditch it appeared to be a piece of metal, but upon closer inspection it showed to be a stone having a glazed metallic coating. The crust was broken off on one side apparently by a blow from a pick, revealing the grain of the stone. Mr. Woodbury thought it was a queer looking pebble and so thinking laid it up on the side of the ditch and went about his work.

Passing on a few feet, he had occasion to turn around to give directions to some person behind him, when his attention was arrested by the strange results produced by the sunbeams falling on the odd seeming pebble. The fractured side happened to be up and reflected the sun's rays in a brilliant flame mainly of a bluish tint, but showing the various tints of the rainbow and blazing up in size and shape much like a large dining glass. Never having seen the like before, Mr. Woodbury thought to keep it as a curiosity and told his brother to put it away. Having read an article in the MINING PRESS in relation to these precious stones, Mr. Woodbury became satisfied that it was a diamond that so much enlisted his curiosity. After making diligent search and inquiry he has been unable to find it. The mislaid diamond was half an inch or more in diameter, and being doubtless of the first water was of great value, perhaps running well up into thousands. Moral—Miners, don't be careless with odd looking pebbles or pieces of metal. Fortune may come knocking at your door and be entertained unawares or worse yet you may slam the door in her face.

BORAX PROSPECTORS.—The Silver State, of Humboldt county, Nevada, in speaking of the trip of a prospecting party says: This same party unexpectedly ran among the "Borax" prospectors, who were numerous to be seen all over the desert in the vicinity of Hot Springs, caving here and there in the alkali. Borax they had found, and upon looking over the vast desert monuments were espied here and there, enclosing the whole alkali domain (nearly), and upon inquiring of them how much territory they had taken up, they answered, "Only forty quarter sections." They certainly have borax, but the extent of it remains to be ascertained. In fact an offer has been made them already for their right. With them it is no longer gold or silver, or hills, but desert and borax. Two of this prospecting party returned with the borax mania, and are now preparing to take up some desert ground not far from this town.

WOMAN'S RIGHTS IN A NEW DIRECTION.—At a miners' meeting, held on the 21st. of February, in Lake Mining District, Lake county, California, the following resolution was passed and ordered placed in their By Laws.

Resolved, That all persons over 16 years of age, are entitled to locate mining ground, and all locators, male or female, are entitled to vote at any miners' meeting.

Lake District is a cinnabar mining locality, and is at this time looming up into considerable importance, from the fact that several very valuable cinnabar mines have lately been opened, which give evidence of vieing with the Almaden mine.

We are rather inclined to the opinion that our Lake District miners have an eye to coaxing a goodly number of young ladies up their way. It probably would be a happy feature for our lonely miners of other districts to take notice and follow the good example set by Lake District.

QUININE.—There is, in the United States of Columbia, a region called San Martin, of which but little is generally known, but which is said to contain vast numbers of the Peruvian bark trees, whence is extracted the highly valuable quinine. Such an extent of Quina forests as San Martin is said to possess,—a territory 40 leagues long and 5 or 6 leagues wide,—is worth many a gold mine.

Meteorological Observations.

AT SACRAMENTO, CAL., BY THOS. M. LOGAN, M. D. Permanent Secretary of State Board of Health.

Lat. 38° 31' 41" N. Long. 121° 29' 44" W. Height above mean low tide at San Francisco, 74 feet. Height of surface of mercury, 94 feet. The amount of cloudiness is designated by figures, 10 being entire cloudiness; 5, half cloudiness; 0, entire clearness; and intermediate numbers in proportion. The force of the wind is also registered in the same manner; 0 being a calm, 1 a very light breeze, and 10 a hurricane. The means are derived from three daily readings at 7 A. M., 2 P. M., and 9 P. M., in uniformity with the arrangements of the Smithsonian Institute.

* Thermometograph. † Rain.

REMARKS.—We have experienced during the week the heaviest rains of the season, measuring, as shown in our table, nearly one and a quarter inches, and swelling the aggregate of the season, in this locality, to 5.369 inches. The storm on the night of the 20th was very general, extending over the mountains into Nevada,—the high wind causing considerable damage everywhere,—and accompanied with electrical disturbances unusually severe, particularly in San Francisco. The oscillations in the mercurial column have been remarkable. From the minimum of the season, (29.021 inches) on the evening of the 22d, it rose to 30.472, corrected for temperature, on the morning of the 25th, and still reads at a high figure at the present writing; (27th) indicating a continuance of the prevailing fine weather. Though comparatively light, the rains thus far have fallen under such favorable circumstances, viz.: prolonged cloudy weather and the absence of drying winds, as cannot fail to inspire confidence in the growing crop.

A ROCKY MOUNTAIN CANAL.—We find a communication in the New York Tribune, suggesting that a canal be built to connect the waters of the Missouri with the waters of the Columbia. The project throws in the shade our proposed canal from the Jefferson river to Helena. Who knows but what, in the course of time, the suggestion offered by the Tribune correspondent may be carried into practical execution? We quote as follows: "As this is the era of ship canals, perhaps one that would make a communication by water from the Atlantic to the Pacific may be worth consideration. A ship canal from the Missouri River to the Salmon and Columbia Rivers, will require about eighty-five miles of canal and about four locks. The Rocky Mountain ascent in that neighborhood is very gradual. When travelers are on the summit they do not realize that they are on an elevation until told that it is the highest land in the pass. The canal would require locks around the Great Falls of the Missouri. The most direct route for a canal is from Horse Prairie Creek to the Salmon River, which is deep and broad, and down the Columbia to Rockland Falls, where a lock would be needed. Then there would be one unobstructed water-course from St. Louis to the Pacific Coast. This would open our northern territories to civilization through Dakota, Montana, Idaho and Oregon.—*Helena Herald.*

PSYCHOMANCY.—Any Lady or Gentleman can make \$1,000 a month, secure their own happiness and independence by reading Psychomancy, Fascination, or Soul Charming, 400 pages. Full instructions to use this power over men or animals at will, how to Mesmerize, become Trance or Writing Mediums, Divination, Spiritualism, Alchemy, Philosophy of Omens and Dreams, Brighten your Home, Guide to Marriage, &c.; 200,000 sold. Sent by mail in cloth for \$1.25, paper covers, \$1.00. The Philadelphia Star speaking of the book says its author is HERBERT HAMMOND, Esq. A celebrated Psychological lecturer, and the publisher, T. W. EVANS, one of the oldest Perfumers and Publishers in the city, the mention of whose name is a sufficient guarantee of the merits of the work. Mr. EVANS has spent \$30,000 already in advertising and getting out this extraordinary book. Skeptics in Psychology read and are convinced of this wonderful occult power.

NOTICE.—Any person willing to act as Agent will receive a sample copy FREE. No capital is required, all desirous of genteel employment should send for the work, inclosing 10 cents for postage, to T. W. EVANS, 418 Eighth street, Philadelphia, Pa. m4-lam3t

MARAVILLA COCOA.—No breakfast table is complete without this delicious beverage. The Globe says: "Various importers and manufacturers have attempted to attain a reputation for their prepared Cocoes, but we doubt whether any thorough success has been achieved until Messrs. Taylor Brothers discovered the extraordinary qualities of 'Maravilla' Cocoa. Adapting their perfect system of preparation to this finest of all species of the Theobroma, they have produced a Cocoa of a delicate aroma, a delicate and a rare concentration of the purest elements of nutrition, distinguish the Maravilla Cocoa above all others. For home use and invalids we commend it to every one who desires a agreeable or valuable beverage." Sold in packets only by all Grocers, of whom also may be had Taylor Brothers' Original Homoeopathic Cocoa and Soluble Chocolate. Steam Mills—Brick Lane, London. Export Chicago Mills, Bruges, Belgium. fe25-ly

Our Printed Mail List.

Subscribers will notice that their names are printed on colored paper and pasted upon each copy of the Press. This is done by machinery, to expedite the issue of our paper, the regular edition of which has become too large to be convenient to send out by the old method of writing the names. The figures found on the right of the pasted slips represent the date to which the subscriber has paid. For instance, 21st/70 shows that our patron has paid his subscription up to the 21st of September, 1870; 4jy72, that he has paid to the 4th of January, 1872; 4j10, to the 4th of July, 1870. The inverted letters occasionally used are marks of reference, simply for the convenience of the publishers.

If errors in the names or accounts of subscribers occur at any time an early notice will secure their immediate correction.

MARIPOSA, Dec. 27th, 1870.—Messrs. Dewey & Co. Pat on Agents.—Gentlemen.—Allow me herewith to tender you my sincere thanks for the efficient assistance you have tendered me in securing my patent and other papers, as well as the promptness and energy displayed by you in our business transactions.

Very Respectfully Yours, JAY R. PALMER.

GIANT CEMENT. GIANT CEMENT.

A most extraordinary and universally needed article for mending Furniture, Crochery, Glassware, Marble, Meerschaum Pipes, Ornaments, etc.; also splicing Leather Belting and patching Boots and Shoes. This Cement possesses extraordinary merit, and is in every way a first-class article. Every can is its own testimonial. Also, MINERS' RUBBER CEMENT, for mending Rubber Boots, Shoes, Belting, Coats, and Hose without stitching! Easily applied, never failing, and perfectly waterproof. Both Cements are put up in TIN CANS ONLY, with full directions. Take no other. GIANT CEMENT and MINERS' RUBBER CEMENT are kept by Druggists and Dealers throughout the country. Country Dealers can be supplied by ordering from any house here or in Sacramento with whom they deal, or by sending direct to us. Send for Agents' Circulars and Price List, to Giant Cement Manufacturing Co., 419 Washington street, San Francisco

MINERS' RUBBER CEMENT. MINERS' RUBBER CEMENT.

The PAIN KILLER is by universal consent allowed to have won for itself a reputation unsurpassed in the history of medical preparations. Its instantaneous effect in the eradication and extinction of Pain in all its various forms incident to rheumatism, neuralgia, and the unsolicited written and verbal testimony of the masses in its favor, have been and are its own best advertisements.

The ingredients of the PAIN KILLER being purely VEGETABLE render it a perfectly safe and efficacious remedy taken internally, as well as for external applications, when used according to directions. The stain upon linen from its use is readily removed by washing with alcohol.

This Medicine, justly celebrated for the cure of so many of the afflictions incident to the human family, has now been before the public over THIRTY YEARS, and has found its way into almost every corner of the world; and wherever it has been used, the same opinion is expressed of its medicinal properties.

In any attack, where prompt action upon the system is required, the PAIN KILLER is invaluable. Its almost instantaneous effect in Relieving Pain is truly wonderful, and when used according to directions, is true to its name, a PAIN KILLER. mel4-lm

MILLER & HALEY'S MILLS, BERRY STREET, Between Third and Fourth Streets, S. F.

Having been burned out at the late fire on Fremont street, we have removed our business to the above locality, where the manufacture of cast-iron, doors, frames, mouldings, etc., in connection with a general mill business, will be carried on by us as formerly, and where we shall be pleased to see all of our old friends and patrons, and as many new ones as may favor us with a call.

Thankful for past favors, and especially for the sympathy extended to us for our late heavy losses, we intend, as heretofore, to deserve the patronage of the public by strict attention to business, fair dealings, and justice to our customers. 19v21-3m MILLER & HALEY,

PACIFIC BRIDGE COMPANY,

OAKLAND, CAL.

ARE PREPARED TO BUILD ALL KINDS OF WOODEN BRIDGES ON
SMITH'S PATENT TRUSS PLAN.

These Bridges have been thoroughly tested in the East for Three Years, and wherever tried have proved superior to any other Bridge in the following points:
Being built of wood entirely, they are not affected by change of temperature.
The timber used is placed so directly in the line of strain, that less material is required to support the same load.
It is not perceptibly affected by shrinkage. It is the most Economical Bridge built. It is adapted to any practicable LENGTH OF SPAN.
Plans, Specifications and Terms will be sent to any County, Township or Person wishing to build a Bridge, and no charge made unless the Plan is used. For all Public Bridges the Plan will always be open to competition.

The California Powder Works

No. 314 CALIFORNIA STREET,
SAN FRANCISCO.

Manufacturers and have constantly on hand

SPORTING,

MINING,

And BLASTING

POWDER,

OF SUPERIOR QUALITY, FRESH FROM THE MILLS. It being constantly received and transported into the interior, is delivered to the consumer within a few days of the time of its manufacture, and is in every way superior to any other Powder in Market.
We have been awarded successively

Three Gold Medals

By the MECHANICS' INSTITUTE and the STATE AGRICULTURAL SOCIETY for the superiority of our products over all others.
We also call attention to our

HERCULES POWDER,

Which combines all the force of other strong explosives now in use, and the lifting force of the BEST BLASTING POWDER, thus making it vastly superior to any other compound now in use.

A circular containing a full description of this Powder can be obtained on application to our Office.
16v20-3m JOHN F. LOHSE, Secretary.

LEA & PERRINS'
CELEBRATED

Worcestershire Sauce.

Declared by Connoisseurs to be the only good

SAUCE. The success of this

most delicious and

unrivalled Condiment

having caused certain

dealers to apply the

name "Worcestershire Sauce" to their

own inferior compounds, the public is

hereby informed that the only way to

secure the genuine is to ask for LEA &

PERRINS' SAUCE, and see that their names

are upon the wrapper, labels, stopper and

bottle.

Some of the foreign markets having

been supplied with a spurious Worcester-

shire Sauce, upon the wrapper and labels

of which the names of Lea and Perrins have

been forged, L. and P. give notice that they have

furnished their correspondents with power of attorney to take

instant proceedings against manufacturers and vendors of

such, or any other imitations by which their right may

be infringed.

Ask for LEA & PERRINS' Sauce and see name on

wrapper, label, bottle and stopper.

Wholesale and for export by the Proprietors, Worces-

ter; Croese and Blackwell, London, &c. &c., and by

Grocers and Oilmen universally. Agents, CROSS &

CO., San Francisco.

BETTS'S CAPSULE PATENTS.

To prevent INFRINGEMENTS, NOTICE IS HEREBY GIVEN, that BETTS'S NAME is ON EVERY CAPSULE he makes for the principal merchants in England and France, thus enabling vendor, purchaser, and consumer, not only to identify the genuineness of the Capsule, but likewise the contents of the vessel to which it is applied. The Lord Chancellor, in his judgment, said that the Capsules are not used merely for the purpose of the ornament, but that they are serviceable in protecting the wine from injury, and insuring its genuineness.
MANUFACTURED BY J. B. BETTS, 11, WILKINSON ROAD, LONDON, AND BORDEAUX, FRANCE.

Mining and Other Companies.

Owing to the time necessary to mail the present large edition of the Scientific Press, we are obliged to go to press on Thursday evening - which is the very latest hour we can receive advertisements.

Stockholders' Meeting—Office of Silver

Sprout Mining Company, 206 Front street, San Francisco, February 17th, 1871.

Notice is hereby given, that a special meeting of the Stockholders in the Silver Sprout Mining Company will be held at the office of the company, No. 206 Front street, San Francisco, on Monday, the 27th day of March, 1871, at the hour of 2 o'clock P. M.

T. B. WINGARD, Secretary.

Taylor Mill and Mining Company—Location

of works, Georgetown District, El Dorado County, State of California.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the 31st day of January, A. D. 1871, an assessment of fifty (50) cents per share was levied upon each and every share of the capital stock of said Company, payable immediately in United States gold coin, to the Secretary, at the office of the Company, No. 520 Montgomery street, San Francisco, Cal.

Any stock upon which said assessment shall remain unpaid on the sixth day of March, A. D. 1871, shall be deemed delinquent and will be duly advertised for sale, at public auction, and unless payment shall be made before, will be sold on Monday, the 5th day of March, A. D. 1871, to pay the delinquent assessments, together with cost of advertising and expenses of sale.

By order of the Board of Trustees.

SAML S. MURPHY, Secretary.

Office, 520 Montgomery street, over Sather & Co.'s Bank, San Francisco, Cal.

fel-5w

El Refugio Petroleum Company,---Loca-

tion Santa Cruz County, State of California.

NOTICE.—There are delinquent upon the following described Stock, on account of assessment levied on the Eighteenth day of January, 1871, the several amounts set opposite the names of the respective shareholders, as follows:

THE
ASPHALTUM PRESSURE PIPE
COMPANY,

HAVING ERECTED A MANUFACTORY
of sufficient capacity to supply their Asphaltum Pipe in
large quantities,

Are now Prepared to Take Orders
AND MAKE CONTRACTS.

This Company will manufacture Pipe and guarantee
it to stand any pressure required; it is lighter than iron
pipe and more durable, it is not affected by chemical
action, cannot corrode, and being glazed imparts no dis-
agreeable taste to water. To miners and farmers it is
invaluable; any body can put it down; it is twenty per
cent cheaper than iron pipe and ten times more durable.
For further particulars, apply at the office of the Com-
pany, Room No. 2, 645 Market street.
Circulars sent on application. 16v21-4f

GARRATT'S CONDENSING LUBRICATOR,

Or "TALLOW
CUP." This is
a California
Invention,
and the
BEST and
Most Eco-
nomical
Lubricator
in use. It
keeps cool,
and its op-
erations are
very readily
observed.
Send for
Circular to
W. T. GAR-
RATT, Cor.
Mission &
Fremont
streets, San
Francisco.

DESCRIPTION.—D, is a glass chamber which contains
the lubricant. C, is a valve and cup for introducing the
lubricant into chamber D. F, is the discharge pipe for the
lubricant, provided with an inverted siphon to prevent
steam from coming back from the steam chest or steam
cylinder into the instrument. E, a waste pipe and valve for
drawing waste water from the oil chamber before re-charg-
ing the same. B, a valve and pipe to introduce water under
the lubricant for the purpose of expelling the same; this
pipe is connected to the boiler or steam pipe therefrom. A,
is a steam condensing pipe or vessel, to provide a full supply
of clean and pure water for the ejection of the lubricant
from the oil chamber; the rapidity of action being regulated
by the valves B and G. 16l8-1f

STEAM JET PUMP.

Blackslee & Williams' Patent.—For
Water, Oils, Acids, Etc.

The best COLD WATER
PUMP for filling tanks for
stationary or portable
Steam Engines. Also high-
ly recommended for
MINES, DISTILLERIES,
SALT WORKS, STONE
QUARRIES, and similar
places, and saves the ex-
pense of putting up and
running an engine.

We ask the attention of
all proprietors of steam
power to the following
points of merit.—It is
operated by steam taken
directly from the Boiler
into the Pump; it has no
valve or wearing parts of
any kind; it requires no
belts, pulleys, or machin-
ery of any kind; it op-
erates entirely independent of an engine; it will not choke
up with foul water; it costs much less to put up and
start; it will not wear out in a lifetime, or require re-
pairs; it is reliable, and certain to work at all times; it
is not liable to injury from freezing.

Satisfaction guaranteed or the money refunded.
Send for Circular. PARKER & HUNT,
Southeast cor. Tenth & K Streets, Sacramento City Cal.
AGENTS.—CHAS. F. BROCK, 117 California st., San Fran-
cisco; KEEP & BARGION, Stockton. Can be seen at

ing, Draining, Grading and Submarine Blasting. Special
attention given to Deep Boring for testing the value
of Mines. Also to Boring Artesian Wells. Office, 318
CALIFORNIA STREET, San Francisco. 25v20-3m

THE WILSON
Patent Steam Stamp Mill

This extraordinary Mill, now so justly popular in the East, is now offered to the miners of the Pacific Coast. Having been in operation now for about two and a half years, the Company feel confident that the

WILSON STEAM STAMP MILL,
For Durability, Efficiency,
AND ECONOMY OF WORKING,
HAS NO EQUAL.

The Wilson Steam Stamp Mill is the only Steam Mill that has had the severe ordeal of practical working, and proved itself eminently successful. It is now in operation in several of the Eastern States and Territories, and gaining an enormous popularity. The whole machine is so simple as to be readily understood by the most ordinary minds. In fact, its simplicity is its durability. The expense of crushing rock or cement with this Mill is less than one-half the expense of any other Steam Mill, and less than one-half the cost. For further particulars inquire of

FURMAN R. WILSON,
San Francisco.

Or of THE WILSON STEAM STAMP MILL CO., 326 Walnut street, Philadelphia, Pa.

NOTICE.—All persons are hereby warned not to manufacture or use any Steam Stamp Mills that are an infringement on the Wilson Patents, as they will be prosecuted to the utmost rigor of the law.
F. R. WILSON,
20v19-1f Supt. W. P. S. S. M. Co., Philadelphia.

from 16 to 36 inches, for grinding Corn, Barley, Feed, Salt, Paints, Drugs, &c. Mills specially adapted for grinding Quartz.
2v22-1yins 41 First st., San Francisco.

Varney's Patent Amalgamator.

These Machines Stand Unrivaled.

For rapidity pulverizing and amalgamating ores, they have no equal. No effort has been, or will be spared, to have them constructed in the most perfect manner, and of the great number now in operation, not one has ever required repairs. The constant and increasing demand for them is sufficient evidence of their merits. They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.

This Amalgamator Operates as Follows.

The pan being filled, the motion of the muller forces the pulp to the center, where it is drawn down through the aperture and between the grinding surfaces.—Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly passing a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.

Settlers made on the same principle excel all others. They bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed.

Mill-men are invited to examine these pans and settlers for themselves, at the office, 229 Fremont Street, San Francisco.

Gold Saving Amalgamated Plates.

Miners, Quartz Millmen—Attention.

Best quality of Silver Plated Amalgamated Plates for saving fine particles of gold, furnished at the

San Francisco Plating Works.

655 Mission Street, Between New Montgomery and Third Streets, San Francisco.

DARLING & CO.,

Importers, General Agents and Commission Merchants.

Machinery, Merchandize and Supplies of every description Purchased and Sold on Commission,

AT LOWEST RATES.

General Agents for the

NATHAN & DREYFUS
SELF OILERS.

These Oil Cups are too well known to require any lengthy description; the following are the main points of advantage.

We guarantee a saving of
75 PER CENT OF OIL.

They are composed of a transparent Glass Cup, mounted in Brass, provided with a hollow tube, inside of which is placed a loose acting solid or hollow wire, which acts as a Feeder and Regulator. The wire rests constantly upon the Journal, thereby acting with the bearing in its motion. The wire is so regulated inside the tube as to feed according to the demand only. There is no flow of oil whatever while the machinery is not in motion.

They are as reliable in Winter as in Summer. Being a perfectly air tight vessel, the oil will never gum in them, as this has been proven by four years' constant use.

They are constructed in a very neat and substantial manner.

We spare no pains in making them as perfect as it is possible for them to be made, and guarantee them to give perfect and entire satisfaction.

DIRECTIONS.
